It is highly satisfactory to note the substantial progress made by the laboratory during the year which ended this month, and we trust that the invaluable work being done by the institution may lead to still greater financial support by the present and future Governments.

INTERNATIONAL SMOKE ABATEMENT EXHIBITION, ROYAL AGRICULTURAL HALL.

BEARING in mind the comparatively limited scope of this exhibition, it could scarcely be expected that so large a building as the Agricultural Hall would be filled to overflowing with apparatus and appliances intended to further the cause advocated by the Coal Smoke Abatement Society.

It is satisfactory to find that the main hall is fairly well filled and that the King Edward Hall is entirely occupied by a comprehensive display of electrical apparatus for light, heat, and power.

In the main hall the visitor will find ample proof of the efforts being made by many engineering firms to reduce the amount of smoke incidental to steam generation, and various improved types of coal and gas fired warming and cooking stoves and water heaters denote the activity of numerous other firms to cope with the unnecessary and wasteful consumption of fuel in private houses and buildings generally.

In the smaller hall electrical engineers demonstrate in a very practical way the justice of their claim that electricity is capable of abolishing smoke production entirely, so far as the consumer is concerned, although, of course, the generation of current must be attended by a certain proportion of smoke, except in cases where oil or gas is used as fuel.

In the following brief review of the principal exhibits we consider them for the convenience of readers under the heads of coal stoves and apparatus, gas stoves and apparatus, steam boiler auxiliaries, and electrical apparatus.

Coal Stoves and Apparatus.

The Carron Company (Stands Nos. 6, 7, and 8) make a comprehensive display of anthracite slow-combusion stoves, dog and other grates, including the Castle series, enamelled baths, and a kitchen range embodying the patent Blacktown fire and other recent improvements. The Blacktown fire, which can be adapted to Carron open and close fire ranges, is so constructed that the air, admitted by controlling ventilators and passing through the firedoor or bottom grate, becomes heated and promotes thorough combustion of the fuel. As the gaseous products are thereby raised to a temperature far in excess of that in an ordinary range the efficiency for cooling is increased and the fuel consumption reduced considerably. A further improvement is to be found in the pivoted shutter of the ashpan hopper, an arrangement excluding cold air and permitting ashes from the front fire to be tilted readily into the ashpan.

The foregoing improvements are embodied at the exhibition in a range of excellent design and finish. The place of the usual plate-rack is occupied by two hot closets with plate-glass doors; the ovens are fitted with duplex doors, the outer one of steel lined with insulating material and the inner one of plate-glass in steel frame for inspection without loss of heat; and the oven dampers are provided with quadrant indicators of neat design. We may add that the oven duplex doors are fitted with an ingenious latch enabling the cook to open both doors together or the outer one only at will.

A new type of electric cooking range exhibited by the Carron Company has been transferred to the electric restaurant, where it may be seen in operation, and we are informed that a second range of the kind will shortly be on view.

The Eagle Range and Gas Stove Company, Ltd. (Stand No. 9), show a "Premier" gold medal range with several novel features, a "new portable" range with oven and boiler, an "Imperial" grate with adjustable front bars and smoke-consuming back, "Premier" and "Governor" grates, an "Eagle" hot closet and independent hot-water boiler, and their "heat distributor" fitted to an ordinary firegrate for warming two or three additional rooms by hot-water radiators.

The "Premier" range, exhibited at work in the front of the stand, includes several recently patented improvements. The fire-box has a hinged front facilitating cleaning, the bottom grate can be raised or lowered with one hand, and hollow smoke-consuming cheeks are fitted at each side, and the back also where a boiler is not used. The cheeks, made of specially tough iron, have a series of gills cast on the back, and give up heat absorbed from the fire to air entering the bottom of the cheeks. The air thus superheated emerges through perforations at the top and, mixing with smoke, causes the latter to burst into flame, insuring perfect combustion and more rapid heating of the ovens and hot-plate. The smoke-abating action of this furnace are demonstrated in the range on view by the aid of talc windows in the flues. The ovens are fitted with duplex doors, the inner one being of glass and the outer one acting as a reflector for throwing light into the interior of the oven, so as to enable cooking operations to be watched even in a poorly lighted kitchen. Over the hot-plate are two ventilating canopy draught regulators and hot closets, and the special coal-saving dampers, now shown for the first time, are arranged so as to admit cold air to the main flue as the dampers are opened, thus obviating excessive heat and the consequent waste of fuel.

The "New Portable" range exhibited is a neat and compact stove very suitable for bungalows and other dwellings. It combines several new features and includes a powerful boiler for hot-water circulation.

The "Imperial" firegrate, with adjustable bars and draught doors, is a good example of a slow-combustion smoke-consuming grate, capable of perfect regulation. The heat-distributor fitted to one of these grates is in reality a small tubular boiler capable of providing sufficient hot water for two or three radiators and a towel-horse, thereby utilising heat that would otherwise pass up the chimney to waste. A simple device permits the boiler to be thrown out of action when not required.

Messrs. McDowall, Steven, & Co., Ltd. (Stand No. 10), show examples of their "Lion" ranges and "Whiteflame" fires. The "Lion" range, shown at work, is constructed with a boiler and boiler flues of new design, patent soot collecting shelves are provided under the ovens to facilitate the removal of soot and the thorough cleaning of the flues, the ovens are fitted with an inner glass door and foot pedal releases, which allow the cook to have both hands free, and temperature indicators of new patterns are fitted to the oven doors.

The "Whiteflame" fire is of entirely new type on the underfeed principle. Visitors can judge for themselves from the stove in operation the justice of the claim made for this fire in respect of perfect combustion and smoke abatement.

The Interoven Stove Company, Ltd. (Stand No. 14), make a feature of Pascall's patent combination stove, comprising a slow-combustion grate behind which is a high-pressure circulating boiler, the fire back being formed by the underside of a hinged hot-plate, while the ornamental canopy above the furnace conceals a large oven. When closed the stove presents the appearance of an ordinary modern fireplace. By a simple movement it can be converted into an efficient kitchen range capable of cooking for eight to ten persons, the oven being equal to one of the size usual in a 36-in. range, and the hot-plate providing accommodation for four large saucepans. The apparatus is self-contained, and can be fitted with very little trouble or expense. For flats, maisonettes, and tenements it would be difficult to devise anything more useful than this combination stove, which weighs about 2 cwt. and measures 38 in. high by 20 in. wide by 14 in deep. The firm also show samples of their "Sunbeam" anthracite stoves of the type which has become so popular during recent years.

The Sinclair Iron Company, Ltd. (Stand No. 15), exhibit one of their "Roseneath" fire-grates fitted with a recently introduced back-plate, increasing the glow and heating efficiency of the fire and making the grate available for burning ordinary coal, anthracite coal, or gas coke.

Messrs. O'Brien. Thomas, & Co. (Stands Nos. 104, 105, and 106) make a good display of anthracite stoves, firegrates, hospital ward stoves, and cooking ranges.

One of their stands is chiefly occupied by examples of the "Lasco" anthracite stove in various types. A very useful addition is the "Lasco" domestic boiler stove newly patented by the firm. The boiler is constructed of copper or gun-metal, and is arranged so that it can be cleaned without removing any part of the stove. Being heated by waste gases from the fire, the boiler is economical and provides constant supplies of hot water for domestic purposes, or may be applied to the warming of rooms or a conservatory, as may be desired.

The "Quadrant" range shown in the adjoining space embodies several new features, including an exceedingly simple and effective form of rising and falling grate, special dampers enabling the oven flues to be regulated in an efficient manner, and a new and very convenient type of clock-face temperature indicator. The range is also fitted with hot closets above the hot-plate, and has the indicating flue dampers now customary in high-class ranges.

The third space occupied by the firm is chiefly occupied by a selection of Boyd's "Hygiastic" ventilating stoves and grates and ventilating cowls. These stoves are now finished in porcelain enamel of any tint to match glazed brickwork, a method of treatment which saves labour, reduces the lodgment of dust, and imparts a pleasing appearance to the stoves.

The London Warming and Ventilating Company, Ltd. (Stand No. 109), have on view a varied assortment of their anthracite stoves and other apparatus, including the "Florence" patent boiler grate, for anthracite coal, for warming several radiators by low-pressure hot water from an open fire; and a continuous burning kitchener with enclosed mica front. This range is capable of heating the contents of a 40-gallon hot-water cylinder, and surplus heat is absorbed before the gases pass into the chimney. It is of the independent type and merely requires to be connected with the chimney by a length of flue pipe.

The Falkirk Iron Company (Stands Nos. 113, 114, and 115) make a representative display of cooking and warming stoves. The "George" range is completely self-contained and has iron flues throughout, facilitating the circulation of the gases and making the work of flue cleaning easy. The close and open fire flues are independent, thus avoiding impaired efficiency of the boiler when the open fire is in use. The furnace has hollow cheeks for heating air before admission, thereby conducing to complete combustion and the prevention of smoke. The fire bars are in the form of thin steel spindles, and the bottom grate is raised and lowered by a simple quadrant action protected from the fire. The oven doors are packed with silicate cotton and lined with white enamelled plates, and plate-glass inner doors are fitted for inspection. An ingenious double-action damper renders the baking oven suitable for ordinary baking, pastry cooking, or roasting, and the doors are opened by a pedal attachment. The company also exhibit Barker's "Hydro-Radiant" independent stove, which can be used to provide an open or close fire, and is fitted with a boiler for hot-water warming purposes. This type of stove can be applied for continuous burning, the combustion of the fuel being under complete control, and the boiler is so arranged that only waste heat is utilised for the boiler.

The "Era" anthracite warming stoves form another interesting series of exhibits, and a new type of warm air grate for hospitals and schools also deserves inspection. Various patterns of the "Pelham" fire are exhibited, and the "Orbit" hot-air controlled combustion stove, handsomely designed in the Adams style, is a distinct novelty. This is an independent stove for ordinary fireplaces suitable for coal or coke.

Gas Stoves and Apparatus.

The Shannon Engineering Company (Stand No. 3) exhibit a new type of water-heater with Bunsen type gas-burner and capable of boiling small or large quantities of water with great rapidity.

Messrs. Bilbie, Hobson, & Co. (Stand No. 4) make a small but interesting display, including two of their Hornsby-Stockport gas engines, a Marsh & Thorp combined blower and governor for high-pressure gas lighting, a Marsh & Thorp combined anti-pulsator and governor for supplies to gas engines, and high-pressure gas burners of 100 candle-power used for illuminating the exhibit.

The James Keith and Blackman Company, Ltd. (Stand No. 26), exhibit gas compressors with the capacity of 2,000 cubic feet per hour, and supplying forty-six Keith lamps of 1,500 candle-power used for lighting part of the exhibition.

Messrs. Ewart & Son, Ltd. (Stands Nos. 56 and 69), have on view a large number of their geysers, "Califonts," and appliances for the rapid heating of water in quantities from 1 to 10 gallons per minute.

The Cannon Iron Foundries, Ltd. (Stands Nos. 58 and 67), have arranged a comprehensive assortment of their gas-heating specialities, including gas fires, gas-heated radiators, gas cooking stoves, boiling burners, washing boilers, and gas irons, in addition to representative specimens of "Porceliron" sanitary ware and fittings. This is a stand that should not be overlooked by the visitor.

Messrs. R. & A. Main, Ltd. (Stands Nos. 71 and 86), exhibit some interesting examples of their gas fires and cooking stoves, the "St. Nicholas" fire being one representing a successful attempt to invest the gas fire with the cheerful aspect of an ordinary coal fire.

Messrs. D. Anderson & Co. (Stands Nos. 70 and 87) exhibit their "Dacolight" lamps of high candle-power for high or low pressure gas, some of these being used in lighting the exhibition.

The Gas Companies' joint exhibit (Stands Nos. 72-75 and 82-85) is one deserving careful inspection. It includes stoves, boilers, furnaces, and other gas fired appliances by the Davis Gas Stove Company, Ltd., Messrs. Fletcher, Russell, & Co., Ltd., The Richmond Gas Stove and Motor Company, Ltd., Messrs. Wilsons & Mathiesons, and the John Wright and Eagle Range, Ltd.

The Foster Engineering Company, Ltd. (Stand No. 92), make a feature of their gas governor.

Messrs. C. E. Podmore & Co. (Stand 106B) exhibit some of their high-power gas lamps for interior and exterior lighting.

Messrs. J. Marse & Co., Ltd. (Stand No. 112), show specimens of their "Visco-Marse" incandescent gas burners of the upright and inverted types, mantles, and auxiliaries.

Messrs. Tilley Bros. (Stand 116) show one of their "Hot Ray" gas fires controlled by a governor which can be fitted to any grate, and their system of high-pressure gas lighting.

Steam Boiler Auxiliaries.

In view of the continually increasing employment of steam boilers in architectural practice, we cannot appropriately pass by the exhibits coming under this head, which relates to appliances intimately connected with the question of smoke abatement.

The Underfeed Smokeless Fire Syndicate (Stand No. 5) exhibit the "Bowden" smokeless firegrate, applicable to domestic stoves and boilers, as well as to steam boilers.

Mr. W. Whitaker (Stand No. 19) makes a special feature of his cooking stoker and sprinkler stoker for Lancashire and other boilers.

Messrs. Babcock & Wilcox, Ltd. (Stand No. 20), devote a large share of their stand to the patent chain grate stoker designed for the smokeless combustion of semi-bituminous coal.

The Smoke Consuming Company, Ltd. (Stand Nos. 32 and 51), exhibit the "Thomas" apparatus for preventing the emission of smoke from tall chimneys without altering any of the existing fittings, except the boiler furnace front and fire bridge.

Messrs. Edward Bennis & Co., Ltd. (Stands Nos. 35 and 48), have an interesting boiler house exhibit, comprising a complete smokeless stoking machine and coal and ash handling plant, and different types of the "Bennis" stoker.

The Metallbank and Metallurgische Gesellschaft A. G. (Stand No. 89) exhibit the ingenious smoke dissipator invented by Professor Wislicens, and of which an account was given some time ago in our columns.

Messrs. J. Ruscoe & Co., Ltd. (Stands Nos. 91 and 101), exhibit their "Auto" mechanical stoker.

Messrs. J. &. P. Hill (Stands Nos. 118-1 show an installation of the Galloway-I furnace, which the makers claim enables cheapest kind of coal to be burned without production of smoke.

Electrical Apparatus.

The display of electrical appliances in King Edward Hall was organised by the Elec Supply Publicity Committee, and is intended appeal strongly to householders. The exhi are grouped in various sections instead of be placed on stands occupied by individual fir Therefore the character this part of the exh tion is quite different from that in the main h

The cooking department of the elec restaurant is open to inspection by visit and serves as a practical demonstration of cleanliness and convenience of electric cook apparatus.

The cooking section in another part of hall comprises specimens of various elec cooking utensils, the heating section is devo to electric radiating and convecting heat and another section is occupied by electrica heated irons for laundry work. Each sect is under the charge of attendants who are re to explain the working of the appliances, catalogues relating to electrical manufactu of every kind can be obtained at the stall of Electric Supply Publicity Committee.

BOOKS.

School Planning: Being a Practical Trea on the Planning of British Train Colleges and Schools. By PHILIP A. R SON. (London: Nicholson & Smith, Amen-corner, E.C.)

MR. P. A. ROBSON'S recently-publis treatise on school planning appears to the outcome of a lecture delivered by author before the class for school nurses health visitors of the Royal Institute Public Health. And so, naturally enou the important subject of hygienic planning relation to school buildings, more particula with regard to public elementary scho is discussed at considerable length. instance, the book contains some g practical advice relative to the choice sites and playgrounds, followed by enumeration of administrative and hygi considerations which affect the plann of entrances and staircases, classroo assembly-halls, cloakrooms, etc.

A well-arranged table of data, extrac from the building regulations of the Bo of Education, which will be found extren useful for ready reference, is an admir feature of the work.

The chapter on recent elementary sc building in Derbyshire comprises a serie interesting notes extracted from a paper r by the Architect of the Derbyshire Educa Committee before the Royal Sanitary In tute in February, 1910. In this paper author, Mr. G. H. Widdows, A.R.I.B suggests that the limit of the number children which can be effectively superv by a head teacher varies from 250 to and that as a rule there should not be n than six classrooms, comprising two ro for sixty and four for fifty children.

"This is, of course, on the large size, 10 sq. ft. per child is not too much, and w the higher elementary basis of 12 sq. ft. child is introduced, as possibly it will be days to come, or when the number of chil for which individual teachers are recognise still further reduced, then these rooms accommodate forty and fifty respectively."

It is also urged in favour of a six-roo school that it enables the three infant cla to be duplicated, and in the case of older pupils each standard has a room itself, for, owing to the smallness of t number, children in Standards VI. and V are almost always taken together.

The typical plans of elementary and o school buildings recently erected in Der shire which illustrated Mr. Widdows's p are full of interest as examples of a pra worthy effort to bring about an improven in the hygienic conditions of school life.

But, although the plans given in illustra of the author's views show marked varia in their general treatment, yet they similar to the extent that in all cases classrooms are provided each, in a greate less degree, with direct cross lighting ventilation, and so, whatever its aspect

jion in the building, sunshine is sure to
n each room during some portion of the

several cases open verandahs, or covered
, take the place of ordinary enclosed
dors, and thus not only do the class-
s open direct into the fresh air, but the
rooms are adequately cross-ventilated.
e fenestral treatment advocated by Mr.
lows has much to commend it. Windows
d in the end gables of classrooms are
with swing lights fixed at a height of
6 in. from the floor, and they are thus
above the eye of the teacher. Those in
ide walls have hoppers at the sill level
swing lights above.
ese hoppers, which only open to the
ht of 4 in., are formed with a deep rebate
he top and provided with a wind shield
orce the incoming air to travel in an
rd direction.
to the heating of the classrooms, in
ion to open fireplaces, low-pressure hot-
r ventilating radiators having a heating
ce of 25 sq. ft. per 1,000 cubic ft. of
nts are fixed in each room.
e glass area provided is equal to one-
of the floor area of the room; all class-
s are 11 ft. in height to the wall-plate
14 ft. to the ceiling.

ross-lighting and cross-ventilation add little,
thing, to the expense. The price paid has
l from 9*l.* 9*s.* to 13*l.* 13*s.* per head, and one
ay that under ordinary conditions a six-
d school costs 11*l.* 11*s.* per head This
des boundary walls, playgrounds, out-offices,
main building, but not site and furniture
special buildings, such as cookery and
al centres."

th regard to higher elementary, second-
and technical schools, Mr. Robson dis-
s the modern tendency to disconnect the
bly-hall from the classrooms by means
tervening corridors. In schools planned
igher education the use of the hall is
more extended than in an elementary
l—*e.g.*, for concerts, prize distributions,
astic displays, examinations, and "even
ing if there be no proper art-room. The
bjects gained by a central hall of the
ype are cheapness and ease of super-
n. The defects of the plan are more
ilties of ventilation and the restricted
t the hall to avoid disturbing classes."
ilities for constant supervision are
's necessary in elementary education, and
schools teaching higher "elementary"
cts the enclosed hall may well
n. But both in secondary and technical
ls the assembly-hall should be well
ed from the neighbouring classrooms.
ools intended for higher elementary
tion should contain—in addition to the
ary class and lecture rooms—suitable
modation for teaching such subjects as
ntary chemistry and physics, laundry-
cooking, general needlework, and art,
here should be one or more workshops.
on the arrangement, lighting, and
ment of these special rooms or depart-
are followed by some valuable sugges-
with regard to the planning of training
es, and the treatise concludes with
s extracts from the reports of Depart-
Committees having reference to the
f school buildings in various parts of
nited Kingdom.
Robson's book will doubtless prove of
service to all who are interested in
lvancement and development of school
ing.

---

ry of Bridge Engineering. By HENRY
TTAN TYRRELL. (Chicago, 1911. Pub-
ed by the Author. Octavo. Pp. 447.)
no easy task to bring so large a subject
the compass of a book such as this.
Mr. Tyrrell has been entirely successful
method of compression can hardly be
ted; but he, to some extent, disarms
sm on this point by explaining that it
en prepared as the historical part of a
ctive comprehensive work on bridge
ering, and on this account the theory
ethods of design are carefully excluded.
itial conception of the book is good.
a brief introduction dealing with early
s, we find bridges classified according to
ructural principles, commencing with
stone bridges, and in subsequent
rs treating of wooden bridges, cast-iron
, truss bridges, suspension bridges,
ver bridges iron and steel arches,
trestles and viaducts, and, lastly, solid concrete bridges. A vast mass of statistical information on the hundreds of examples included will doubtless give the book considerable value as a work of reference, although it necessarily detracts somewhat from the literary interest. It would have been far better to have given this information in tabular form so as to avoid the necessity of encumbering the descriptions with particulars of cost and dimensions. Uniformity in the scale of the diagrams would have assisted comparison, which, after all, is the most important point, while dimensions, etc., would be much easier to find in a table than scattered through the text. It should also be understood that the subject is approached mainly from the point of view of the constructor, and, while many bridges of marked beauty are illustrated, the author evidently feels that it would widen the scope of his work too much to go into questions of æsthetics.

Practical Sewerage and Sewage Disposal. By H. C. H. SHENTON, F.S.E., M.I.Mun.E., M.R.San.I. (S. Edgecumbe Rogers, 27A, Farringdon-street, E.C. Price 3s. 6d. net.)

INSTEAD of describing many methods and appliances, good and bad, from which the reader is left to draw his own conclusions, definite practical recommendations are given in this work as far as possible, so that those who have actually to carry out work can obtain from the book very useful advice. The whole of the book is arranged in paragraphs which are numbered, and in addition to the usual chapter headings there are many sub-headings which indicate clearly the various matters dealt with in each chapter. The book has been kept at a size which makes it suitable for the pocket. The general design, construction, and maintenance of sewers are described, and the recommendations with regard to the design, construction, and management of sewage disposal works and land treatment are based upon the latest developments in this work, and particularly upon the Reports of the Royal Commission on Sewage Disposal. We are glad to call attention to a useful little book.

Refrigeration, Cold Storage, and Ice-Making. By A. J. WALLIS-TAYLER, A.M.Inst.C.E. Third Edition. 414 Illustrations. (London: Crosby Lockwood & Son. 1912. Pp. 632. 10s. 6d. net.)

IN this treatise is included the third edition of a smaller work, entitled "Refrigerating and Ice-Making Machinery," the combined treatise discussing a good many technical matters that come more strictly within the province of the engineer than of the architect. But, as often happens, the architect is expected by his clients to know everything, and therefore he will find a great deal of valuable information even in the engineering part of the book. The chapters on "Refrigeration and Cold Storage" and on "Manufacturing, Industrial, and Constructional Applications" are specially interesting to architects because they deal with the design and arrangement of cold storage chambers, giving data and illustrations of practical value. The book is an excellent guide for all concerned in the subject.

LEGAL COLUMN.

Surveyors' Fees.

It is curious how often in contracts drawn up relating to important transactions between business persons some material point is left open which subsequently necessitates litigation. In the recent case, Reading Industrial Co-operative Society *v.* Palmer, the plaintiffs had purchased some land from the defendants for building purposes, and it was a term of the contract that the buildings erected thereon should be approved by the vendor's surveyor, but the contract was silent as to who should pay the surveyor's fees. The defendants endeavoured to set up a custom that in such cases the fees, in the absence of special agreement, should be paid by the purchaser but they failed in showing this, and on the evidence the Court held that there was no such custom—at any rate in Berkshire, where the land was situated. Then it appears to have been argued that as the approval of the plans was material to the purchaser the burden ought to fall upon him. The Court, however, did not accept this view, but held that the covenant was for the interest of the vendor, restricting the user of the land which otherwise the purchaser would have been entitled to use without restriction, and that the surveyor was instructed and retained by the vendor, who conferred upon him the authority to approve plans, and in such circumstances the person who retained the surveyor was the person to pay him.

Trade Union Law.

The case—Russell *v.* Amalgamated Society of Carpenters (noted the *Builder*, January 29, 1910) has been carried to the House of Lords. The claim was that of a widow of a deceased member of the trade union in respect of certain sick and superannuation benefit which she alleged was due to her husband before his death, and in the alternative she claimed a return of the money paid by him to the society; but the merits of the case had not to be considered by the Courts because the union raised the contention that by reason of the Trade Union Acts the Courts had no jurisdiction to entertain the action.

The history of the case is somewhat peculiar. In the Court of First Instance it was held that this was a proceeding to recover damages for the breach of an agreement to provide benefits for members which sect. 4 of the Trade Union Act, 1871, prohibits the Courts from entertaining (see the *Builder*, May 22, 1909). In the Court of Appeal this question was not argued, but it was contended that the rules of the society were such that it was not a society whose objects were in restraint of trade, or if some of its objects were so illegal, yet they could be dissevered, and consequently an action would lie at common law quite apart from the Trade Union Acts. The Court of Appeal decided that many of the rules were in restraint of trade and illegal, and they could not be disconnected, and therefore no proceedings could be taken at common law.

In the House of Lords, according to the report in the *Times*, the majority decided the case on the same grounds as the Court of First Instance, and no opinion was expressed by them on the points raised in the Court of Appeal. Lord Robson, however, dealt with the point, and he held that since under one of the rules members of the union subjected themselves to fine and suspension, or even to expulsion, if they did not comply with the decision of the Committee as to strikes, and obey the trade union rules of the district, and bound themselves not to work under a sub-contract or on work "made under unfair conditions," the union was illegal in the sense that its objects were in restraint of trade, and he held that the sickness and superannuation benefits could not be dissevered, as there was no distinction made in respect of these objects, nor any separation in the funds. In the report of this case in the "Weekly Notes" it appears that the majority of the Lords decided the case on this point also, and as it has been the cause of much litigation this would be most satisfactory.

Powers of Corporations; Municipal Trading.

A case, Attorney-General *v.* Mayor, etc., of Sheffield, which occupied one of the Chancery Judges for some days, again raises the question whether a Corporation with powers to supply electrical current has also power to engage in trade and supply fittings. Similar questions were raised some time back in a case before Mr. Justice Neville, Attorney-General *v.* Corporation of Leicester (the *Builder*, July 9, 1910); but in the present instance both parties have intimated their intention of carrying the case to the House of Lords. The action was brought at the relation of a ratepayer to restrain the Corporation from (a) within their area of supply (1) erecting and installing electric-light fittings, wiring houses, and fixing and installing electric bell fittings and apparatus for domestic telephones; also through sub-contractors installing lightning conductors. These things were supplied to persons, whether they took current or not. (2) Keeping a depôt for the display of such articles and fittings. (3) Executing repairs. (4) Cleaning and maintaining arc lamps. (b) Outside the area of supply, from supplying motor fittings and accessories for electric motors and similar things to those enumerated above.

The funds employed were obtained by the statutory powers conferred upon the Corporation for its electrical undertaking.

The Court held that the case was practically covered by the decision of Mr. Justice Neville, and that neither under the Municipal Corporations Act, 1882, nor under the Sheffield Corporation Act, 1905, was the Corporation entitled to carry on the above operations.

In our note to the case before Mr. Justice Neville we pointed out that there was a distinction between the Electric Lighting Act,

1882, and the Gasworks Clauses Act, 1847. The latter confers certain powers to supply fittings, whereas the former Act does not.

Vendor and Purchaser.

In the purchase of freehold or leasehold property it very often happens that the intending purchaser inspects the property and, thinking it will suit him, makes a tentative offer without having professional advice, with a view to ascertaining whether the vendor is likely to come to terms with him before going to further expense. This, indeed, may be said to be the ordinary practice; therefore a recent decision of a Judge of the Chancery Division in the case of Von Hatzfeldt-Wildenburg *v.* Alexander ("Law Reports") is of especial interest to intending purchasers. The subject-matter of the dispute was a leasehold house in Grosvenor-square, and the only contract was contained in three letters which passed between the vendor's and purchaser's agents. In the first letter the agents said that their client was willing to accept 25,000*l.* for the lease. The purchaser's agent then wrote accepting the house at that price, but subject to certain conditions. Two of these conditions were (1) that the purchaser's solicitors should approve "the title to and covenants contained in the lease, the title from the freeholder, and the form of contract"; (2) that the purchaser approved her surveyor's report. The vendor's agents then wrote accepting the purchaser's offer. The purchaser did not approve her surveyor's report, and demanded from the vendor a contribution of 1,000*l.* towards certain wants of repair and deficiencies. The vendor then withdrew the offer to sell, and the purchaser commenced an action claiming specific performance of the contract contained in these letters.

It is to be remembered that it was the intending purchaser who was seeking to enforce the contract, and therefore it is to be presumed she intended to waive the conditions, such as approving surveyor's report. The decision turned upon that condition as to the approval of title, etc., and the Court held that as the purchaser's solicitors were to approve the freehold title, which could not be called for on an open contract for the sale of a lease, this condition could not be treated as a mere expression of the desire of the parties as to the manner in which a transaction already agreed to should be carried out, but it was a real condition showing the contemplation of the execution of a more formal document to complete the contract, and the letters in themselves, therefore, did not constitute a binding contract.

Extraordinary Traffic on Highways.

The case of Colchester Corporation *v.* Gepp and King ("Law Reports") throws some additional light on that complicated branch of the law relating to extraordinary expenses incurred on the highways by reason of damage caused by excessive weight or extraordinary traffic. The plaintiffs in the action were the highway authority, the defendants were the Corporation and a contractor who had entered into a contract with them for the erection of certain buildings in connexion with the lunatic asylum.

By their statement of claim the plaintiffs alleged that extraordinary expenses had been incurred on Mile End Road, Colchester, as shown by the certificate of their Surveyor, having regard to the average expense of repairing the highways in the neighbourhood. The expenses were placed at 1,577*l.* 11s. 9d. From further particulars obtained by an order of the Court, it apeared that the above sum was arrived at by deducting 217*l.* 8s. 4d., from the actual expense of repairing the road, and that this latter sum represented the average for one year of the expenditure of repairing the said road. The defendants applied to the Court for further particulars of the average expense of "similar highways," and the Court of Appeal has now affirmed the Court below in making this order.

To appreciate the importance of the point it is necessary to glance at the Highway Acts and the recent decision of the Court of Appeal in Billericay Rural District Council *v.* Poplar Union.

Sect. 23 of the Highways and Locomotives Act, 1878, as subsequently amended, provides—"Where by a certificate of their Surveyor it appears . . . that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incured by such authority in repairing such highway by reason of the damage caused by excessive weight passing along the same, or extraordinary traffic thereon, such authority may recover . . . such expenses as may be proved to the satisfaction of the Court to have been incurred. . . ." In the Billericay case the Court of Appeal held that the latter part of the section means the expenses defined in the earlier part of the section to be ascertaind by the Surveyor by reference to the average expenditure of repairing similar roads. Therefore the importance of the present decision can be seen, as it carries into effect the principle affirmed in the former case, and lays the burden upon the plaintiff of proving, not the average expenses of repairing the road that has sustained injury, but the damage incurred as ascertained by reference to the average expenditure on other similar roads.

One other observation remains to be made on the Billericay case. In the Court below there were certain expressions contained in the judgment from which it might appear that the learned Judge who tried the case thought that the test which might be applied was to consider whether or not in fact the rates had had to be raised to meet the extraordinary expenditure. In our issue for October 6, 1911, we pointed out that any such consideration taken by itself would be most unsatisfactory.

In the Court of Appeal in that case Lord Justice Buckley expressed the very same opinion as to this being an erroneous view, which we put forward in our "Note" and for the same reasons. The Court only affirmed the decision of the Judge upon the ground that he had rightly held that the plaintiffs had not proved their case before him under the section, as they had not proved the average expenses of repairing similar highways in the neighbourhood.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

Heavy Claim against Surveyors:

Stronge and Others *v.* Beadel, Wood, & Co.

JUDGMENT was given last week by Mr. Pollock, who began the hearing of this action in February, which occupied in the aggregate twenty-two days, during which many expert witnesses were called and lengthy arguments advanced. The plaintiffs, Sir James Henry Stronge, Mr. William Van Sommer, and Mr. John Marcus Poer O'Shea, trustees of the Thorpe Hall estate at Southchurch, near Southend-on-Sea, claimed damages against Messrs. Beadel, Wood, & Co., Ltd., of Gresham-street, E.C., for negligence the plaintiffs alleged had been shown by the defendants in the preparation of contract plans and drawings, and also in the supervision of a contractor's work in the construction of a sea and retaining wall, and the making of certain roads on the Thorpe Hall estate.

It appeared that the sea wall had bulged forward and given way, and the plaintiffs alleged that this was occasioned by the foundations having been placed at an insufficient depth in the clay subsoil, and the insufficient draining of the wall. The consequence was that the pressure of land water at the rear was too great for the wall to stand. The defendants denied negligence, and said that the work had been properly carried out, and pleaded that every possible precaution had been taken, and, further, that the collapse of the wall was the outcome of an act of God, erosion having been started by a storm in October, 1909, although no erosion had taken place during the last forty years previous to the wall's collapse.

Mr. Hudson, K.C., Mr. Moresby, and Mr. Inman (instructed by Messrs. Van Sommer & Chilcott) appeared for the plaintiffs, and Mr. Sankey, K.C., and Mr. Ernest Todd (instructed by Mr. C. J. Parker) represented the defendants.

In the course of a judgment, delivered without notes, and lasting two and a half hours, the Official Referee stated that the work had been carried out under two contracts, a local contractor, Mr. Anstead, being employed in the two instances: Mr. Beadel had been engaged by the trustees as surveyor for the purposes of certifying that the work was fittingly executed. It was a term of the contract that the contractor was not to be paid the final 20 per cent. due to him until a period of six months had passed from the completion of the work. During that period the contractor was liable to maintain the work in sound condition. Mr. Beadel in each case, however, certified for payment of the whole of the balance at the same time as he certified the completion of the work, with the result that in one case Mr. Anstead received about 1,500*l.*, and in the other he received over 2,000*l.*, to which he would not have been entitled for another six months even if the work had been perfectly satisfactory. Mr. Beadel, said the Referee, had granted certificates throughout without regard to the that had been done, and seemingly granted them just when Mr. Anstead fo would be convenient to receive some Both in this connexion and in the grant the final retention money Mr. Beade shown great negligence, and he had als negligent in the preparation of the sp tions, which had enabled Mr. Anst scamp the work concerning the found He (the Official Referee) felt he could n on the statements as to the facts of Mr. Beadel or Mr. Anstead, unless sup by independent evidence. In the o particulars as to the alleged act of G defendants had relied on the excessive r and no suggestion had been made as existence of a spring which had now be forward. When Sir Alexander Binnie w sulted his report revealed the condition wall to be just what one would have ex it, assuming the plaintiffs' allegation justified. The foundations were not su The material was bad, and there w fact, a permanent spring behind th which had never been adequately dealt The defendants' statements as to erosi been entirely contradicted by the exper

Dealing with the question as to what the wall to fall, the Official Referee sai no evidence as to negligence in contract fications would convict the defenda negligence in this case if, in fact, th had been efficiently constructed, and to have stood, if it had not been carrie by something for which they wer responsible. Erosion had been suggest none had taken place for forty years and seemingly none had taken place the occurrence. It was amply clear t work had been scamped in every deta (Mr. Pollock) was satisfied, on the ev that no erosion took place at all. H also satisfied that there had been a behind, which was never properly deal and that the spring caused the w collapse. He must, therefore, conclud the wall had been negligently built, a there had been no proper supervision, must, therefore, hold defendants to be Dealing with the figures, he said t found that on the claim the plaintiff entitled to 6,080*l.* 11s. 2d., and that defendants' counterclaim (for work do side the contracts), the defendants were to 1,269*l.* 15s. 7d. There would be a l judgment for the plaintiffs for 4,810*l.* 15

Mr. Ernest Todd asked for costs con different items which had been admit the defendants' counterclaim, but the Referee refused this application.

CHANCERY DIVISION.

(Before Mr. Justice SWINFEN EADY

Alleged Custom as to Surveyor's Fe

Reading Industrial Co-operative Society *v.* Palmer.

HIS LORDSHIP heard this case on March 22, Saturday, the 23rd, and Mond 25th. It raised an important question alleged custom in Reading and distri also in London, that the purchaser for building purposes, whose building had to be approved by the vendor's su was liable to pay the fees of such su and also a question of construction conveyance of land to the plaintiffs.

Mr. Frank Russell, K.C., and Mr. Lu appeared for the plaintiffs; and the ants were represented by Mr. Micklem and Mr. Stiebel.

In opening the case Mr. Russell sa the action was commenced by orig summons in the first instance, and r short point of construction under an in of conveyance, by which certain land, in extent, in Grovelands-road, Readi conveyed by Sir Walter Palmer, Bart., plaintiffs. The defendants were Eustace Exall Palmer, Robert Clarina and Richard Blake Harrison, who w trustees of Sir Walter Palmer, who h since the date of the conveyance, wh May 18, 1908. Under the conveyan defendants were to put a building on t to the satisfaction of the vendor's su They had, of course, to pay their o veyor's fees, and the defendants co that they had also to pay the fees Walter Palmer's surveyor. Evidence w by the plaintiffs in support of the su and in the defendants' evidence in answ set up a custom that, notwithstand contract, there was a custom prevale the plaintiffs were bound to pay Sir Palmer's surveyor. Then another s was taken out asking that the case sh put in the list for trial with witn

that the question of custom could be with. The plaintiffs issued a writ claim- ecific relief, and thus the matter came the Court. The conveyance contained nant on the part of the plaintiffs that ould observe and perform the covenants ed in the schedule. After reading the Mr. Russell submitted that it was for fendants to show that anything else nported into the contract between the by reason of a special local custom. ordship agreed, and accordingly Mr. m called evidence, the effect of which n in the judgment appearing below.

Russell called rebutting evidence, and Vm. L. Millar, F.S.I., an architect and or, who had carried on his profession ding for upwards of twenty-five years, e first witness. Mr. Millar said he for several building estates, and was y piecework or time. When buildings erected had to be approved by the ven- surveyor, the costs of such approval sually paid by the vendors. When the ct was silent as to that, he always d the vendors. He never charged the ser for approving plans unless there specific clause to that effect in the ct.

Russell: You have heard the evidence as to a custom that where the contract nt the purchaser should pay the costs? e is no such custom in our part of the y, that is for 10 miles round Reading.

Eggington, surveyor, of Reading, gave r evidence.

r the close of the plaintiffs' evidence Micklem gave up the point of custom ading, but submitted that the certificate vendor's surveyor was for the benefit plaintiffs and not for defendants' bene- ven assuming that Mr. Tuckett was ved by the defendants, he would have to heir orders, but would have an absolute ion to say, "I will not give you my ate of approval until I am paid by He would be in the position of a rbitrator.

r hearing counsel,

Lordship, in giving judgment said: aintiffs claim a declaration that accord- the true construction of the conveyance y 18, 1908, the plaintiffs are not bound y the costs, charges, and expenses id by the defendants in obtaining the val of the surveyor of the defendants specifications and plans pursuant to the plaintiffs proposed to build. When mmons was issued the sole question was er the plaintiffs were under any liability . It appears, however, that the defend- et up that there was a custom or usage must be treated as incorporated under ed. That custom was denied, and as estion could not be tried on a summons, was issued by the plaintiffs so that it be tried with witnesses. As put into by the defendants, the custom alleged follows:—

That by general usage, where a convey- contains covenants by the purchaser to build except in accordance with plans specifications to be approved by a sur- r; the fees of the surveyor, including legal charges properly incurred by him, paid by the person requiring the roval in the absence of any express ision in the contract."

ave, therefore, first to determine the uction of the deed, and secondly whether stom is established so as to throw the n of disproving it on the plaintiffs.

convenance of May 18, 1908, was to the plaintiffs to erect a steam bakery, he frontages to the land were reserved Walter Palmer, and not conveyed to rchasers. In the deed the purchasers nted to perform and observe the stipu- and restrictions in relation to the land d by the vendor. The vendor did not nt in any way with a view of binding wn land as to the way in which s to be developed, or of restrict- n any way the user of his own The covenants are only by the vendor rict the user of the land conveyed to the ffs. In the first schedule to the deed aintiffs undertook to erect to the satis- of and under the inspection of the ven- good and sufficient fence or wall along all undaries of the premises, and secondly erect any building whatsoever on a part of the property, and not to erect uilding otherwise than in accordance ch plans and specifications as might be sly approved of in writing by the sur- of the vendor. After the conveyance laintiffs submitted plans to Messrs. t & Son. the vendor's surveyors, of ildings they proposed to erect. On February 12, 1909, Messrs. Tuckett & Son wrote with reference to the plans:—". . The customary charge for approving plans and seeing that they are properly carried out is 1¼ per cent. of the cost of such buildings, but as you will be spending a considerable sum of money, we propose to charge you an inclusive fee of 100 guineas." It appeared that the cost of the buildings was close upon 3,000*l*. The plaintiffs objected, and saw Sir Walter Palmer, who communicated with Messrs. Tuckett & Son, and in the end the buildings were put up and the plaintiffs did not pay anything by way of fee to the vendor's surveyor. The next thing was with regard to the conveyance. A letter of March 3, 1909, from Messrs. Tuckett & Son stated that they could not approve the plaintiffs' proposal of a six-foot iron fence, and suggested various alternatives. It was quite manifest that they were considering the effect of the fence on the adjoining land of Sir Walter Palmer. In 1911 the plaintiffs wanted to make a slight addition to the building, and in June they submitted plans to Mr. Tuckett for his approval. Those plans were returned by Mr. Tuckett with an intimation that they ought to be sent to Messrs. Waterhouse & Co., the solicitors for Sir Walter Palmer's trustees. Accordingly the plans were sent to Messrs. Waterhouse. A question had arisen as to whether the plaintiffs were liable to pay the surveyor's charges, and it was thought best that the plans should be sent to the surveyor through the solicitors. On July 6 Messrs. Waterhouse wrote:—"We shall be pleased to consider the plans on receiving from you an undertaking to pay our charges and the surveyor's fee in connexion therewith. It does not follow that Messrs. Tuckett have no authority to represent the executors, but it is best for us, acting for the trustees, to instruct them in the usual way."

The plaintiffs would not give any undertaking to pay the costs, and on July 18 Messrs. Waterhouse wrote:—"It is without exception the practice for the applicant to pay the charges of the lessor's solicitors for the licence, and it is the same with regard to making alterations. Our clients are trustees, and we cannot ask them to consent to matters of a technical character without being properly advised, and unless you are prepared to pay these charges we cannot consent to the alterations." That letter was written under a misapprehension, because the consent of the trustees was not required; all that was necessary was that the plans should be approved by the vendor's surveyor. On October 12, six guineas having been paid by the purchasers without prejudice to any question, this summons was issued raising the question of construction. Of the six guineas, one guinea was for legal charges and five guineas for Messrs. Tuckett & Son's costs.

It was urged by the defendants, first, that according to the true construction of the deed the purchaser ought to pay the surveyor's costs of approving, *i.e.*, that it was like a licence under a lease, and the burden ought to fall upon the person who asks for the lease. In my opinion, that is an erroneous way in which to look at the deed, and was not the position of the surveyor under it. In my opinion, the covenant is a covenant in favour of the vendor—a restriction upon the user which the purchaser would otherwise be entitled to put his land. The land was conveyed in fee simple, and in the absence of any restriction, the purchaser would be able to do what he liked with it. It is quite obvious that the fence to be erected under the inspection of the surveyor is a fence which the surveyor for the time being of the vendor has to approve. He is the person to approve. In my opinion, the surveyor under the deed is a person who is instructed and retained by the vendor or his assigns, and to whom authority is conveyed to approve plans on behalf of the vendor. He can only approve plans as the vendor authorises him to do it. In my opinion, the person who employs and engages the surveyor is the person to pay him. It is very common for the contract to expressly provide for the party to pay the surveyor, and in case the charge is thrown upon the purchaser it usually specifies the fee as so much per house. In the present case there is no reference in terms to the person by whom the surveyor is to be paid, and there is nothing, in my opinion, which requires the purchaser to pay the surveyor's charges as a condition precedent to obtaining approval of the plans. Clauses I. and II. of the schedule to the conveyance must be read together. In my opinion, the vendor in both cases—with regard to the fence and with regard to the building—is to pay his own surveyor for the work which he does for him in approving the plans from which the buildings are to be erected. If it were a matter of construction only, I am of opinion that there is nothing to show that this is a charge upon the purchaser.

But it is said that in a case like this evidence of usage and custom can be received by way of addition to the written contract. I am of opinion that no evidence has been adduced at all, that there is any custom whatever for the purchaser to pay any legal charges. It is strictly confined, if there is such a custom, to the fees of the surveyor. In order to establish the custom in regard to the surveyor's fees, the defendants called three eminent London surveyors, Mr. Farebrother Ellis, Mr. Tuckett, and Mr. Savile. The custom as stated by Mr. Tuckett was 1¼ per cent. on the cost of the building. Mr. Ellis said that he had never heard of a custom with regard to the scale of 1¼ per cent., and he did not know of any definite scale. Mr. Tuckett thought until recently that the scale was 1¼ per cent. for approving plans without reference to the amount of work. Quite recently, however, he said he had heard that the scale was fixed by the Royal Institute of British Architects. Mr. Savile said he did not work on scale at all. Mr. Micklem, after that evidence, very wisely said that the evidence as to the amount of the scale breaks down altogether. On the other hand, Mr. Tuckett introduced a new exception to cases where the purchaser was to pay. He said there was an exception in cases where there was a large estate, and the vendor's surveyor was a salaried servant, and that such a surveyor was not entitled to charge a fee. It seems to me to be very difficult to apply that principle. Mr. Savile further said it is usual in most cases expressly to provide by the contract that the purchaser should pay. In my opinion, having regard to the different views of these three eminent gentlemen as to the nature and extent of the alleged custom, I am not satisfied that such a custom exists, even in London and the surrounding district. I certainly think it is quite clear, and quite sufficient for the determination of this case, that there is no such general usage extending into Berkshire.

The plaintiffs called evidence to show that no such custom existed, in Reading and district, at any rate. Mr. Millar and Mr. Eggington not only denied that the practice existed at Reading, but showed that the practice was the other way, and that when contracts were silent as to who should pay the surveyor's fee for approving plans, the practice was that the vendor should pay, so that not only does the alleged custom fail, but the exact opposite is established. In those circumstances, I am of opinion that the plaintiffs, the purchasers, are not under any liability either as a matter of construction of the contract or by any general usage or custom that can be imported into the contract to pay the costs of the vendor's surveyor for approving the plans. In my opinion, the gentleman who approved the plans—the surveyor for the time being of the vendor—is employed by the vendor, and ought to be paid by him. There will be a declaration to that effect in favour of the plaintiffs, one order on the summons and in the action, and the costs will follow the event.

What is "Repair"? Decision under the Building Act.

A DECISION under the Building Act was recently given by Mr. Garrett, at the West London Police-court, when the point as to what constitutes a "repair" came up for discussion. Messrs. Lichwitz & Co., roofing manufacturers, of Market-street, Paddington, were summoned at the instance of Mr. Tolley, District Surveyor for North Kensington, for failing to give a building notice in respect of a building at 41B, Portland-road, Notting Hill. Mr. H. Pierron (Messrs. Pierron & Ellis) supported the summons, and Mr. Graham Mould (instructed by Messrs. Corbould, Ellis, & Mitchell) represented the defence.

Mr. Pierron stated that the defendant firm carried out a contract for re-covering the whole of the roof of a workshop without giving notice to the District Surveyor. The matter came accidentally to the knowledge of the District Surveyor, who wrote to the defendants and received a reply that they "had merely repaired the zinc roof covering." As a matter of fact, they had covered the whole of the roof with new zinc, and, having regard to the fact that so much of the new patent roofing, a material which was not incombustible, was used, it was very necessary that the District Surveyor should be given an opportunity of testing it in the interest of public safety. He (Mr. Pierron) understood that the defence relied on the exemptions in sect. 209 of the Building Act, which provided that notice was not necessary where there was being carried out "necessary

repair" to a building "not affecting the construction of any external or party wall." He (Mr. Pierron) argued that in this case it was not a matter of repairing the roof, but of making an entirely new one, and he reminded his worship that last May his worship, in a similar case, decided in favour of the District Surveyor.

Evidence was given by Mr. Tolley, the District Surveyor, who stated that the whole of the roof had been recovered with zincs with the exception of the clips.

In answer to Counsel for the defence, the witness said the brickwork of the walls and the woodwork under the roof had not been touched. The work did not affect the construction of any external wall, or was it an addition to or an alteration of the building.

For the defence, evidence was given by Mr. Martin Lichwitz, a member of the firm, who stated that there was no other way of repairing the roof than by putting new zinc in. They did not touch the brickwork or the woodwork, or make any structural alteration at all.

In answer to Mr. Mould, the witness said his firm had been twenty years engaged in roofing work, and they had never given notice to a district surveyor.

In answer to Mr. Pierron, the witness admitted that, with the exception of the clips, the whole of the roof was completely covered with new zinc. His firm did not use the new patent roofing; they only used zinc and iron.

Mr. Mould, addressing the magistrate, contended that his clients came within the exemption in sect. 209, inasmuch as this work was a necessary repair, which did not affect the construction of the building. The point was—was this a repair? and, considering that the only way to repair a zinc roof was by putting in new zinc, he contended that this was a repairing of the roof. If the contention of the District Surveyor was true, his (Counsel's) client might have taken off half the roof at a time and thus escaped the necessity of giving notice. If the defendant had left only one old roll on the roof he would have come within the exemption. Counsel argued further that this work was also a repairing of part of the building, and he cited the case of Badger and Denn, J. P., Vol. 22, page 129, in which the judges in a Divisional Court held that the reconstruction of a doorway was a necessary repair.

The Magistrate observed that he did not suppose there was any Act of Parliament which was so complicated and as difficult to decide upon as the Building Act, and the real truth was that each case had to be decided on its own merits. Reviewing the contentions advanced on either side, his worship observed that he considered that the argument for the defence—viz., that you could not repair a zinc roof except by renewing it—was a sound one, because in so many cases renewal was a good deal more than repairing. The matter was a difficult one to decide, but what occurred to him was that the main structure of the roof remained, and he therefore held that this work amounted to nothing more than the repairing of an old roof. He therefore dismissed the summons.

LONDON COUNCILS.

Acton.—At the last meeting of the Council a recommendation was passed to the effect that notices be published of the intention of the Council to apply to the Local Government Board to prepare a town-planning scheme for the area on the north side of the district. The Board are also to be asked to grant leave to the Council to dispense with the service of notices, draft orders, and orders to occupiers whose tenancy is less than a quarterly tenant.

Barking.—Tenders are to be invited for the erection of an administrative block at the hospital, also for the erection of artisans' dwellings in accordance with three schemes prepared by the Council's Architect. Plans have been passed for Mr. J. Graffy for the erection of fifteen houses in Ripple-road.

Battersea.—The Council have decided to execute paving works in connexion with the widening of Falcon-road on behalf of the London County Council, at a cost of 969*l.* A portion of Clapham-common, west side, is to be made up, the carriageway with tar, red slag macadam, and the footways with 2-in. artificial stone and tar-paving, at an estimated cost of 1,427*l.*; as is also a portion of Cringle-street, with the same paving except the footpaths, which are to be of 2½-in. artificial stone, at an estimated cost of 848*l.* Repairs are also to be carried out in various roads throughout the borough at an estimated cost of 323*l.* Electricity mains are to be extended at an estimated cost of 403*l.* Plans submitted by Price's Patent Candle Company, Ltd., have been passed for the erection of offices at their Belmont Works, York-road.

Bermondsey.—Plans have been passed for rebuilding premises to new frontage line in Rotherhithe-street for Mr. R. Hyde. The architect is Mr. H. D. Scarles Wood, of 157, Wool Exchange, E.C.

East Ham.—Sanctions have been received from the Local Government Board to the borrowing of 8,943*l.* and 1,772*l.* for the execution of sewage works in High-street North, East-avenue, Southend road, and Sibley-grove, and for concrete sewers in connexion therewith, respectively. Plans have been passed as follows:—Mr. G. Mitchell, seventy-eight houses, Monmouth-road; Mr. A. W. Pierce, twenty-four houses, Brampton-road; Messrs. T. Young & Sons, eight houses and two shops and houses, Barking-road; Mr. W. Smith, eight houses, Mafeking-avenue.

Finchley.—The following plans have been passed:—Messrs. Lavington Brothers, six houses, Fenstanton-avenue; Mr. R. Ellwood, five houses, Holmwood-gardens; Mr. G. Bennett, six houses, Lansdowne-road; Mr. J. C. Williamson, six houses, Clarence and Lyndhurst Gardens.

Hackney.—Plans prepared by Mr. Cooper, architect, of the branch library proposed to be erected in Homerton have been approved by the Council, and are to be forwarded to Mr. Carnegie. On his approval tenders are to be invited. It is estimated that the building will cost 5,280*l.* The tender of Mr. A. T. Catley, 23, Lloyd-square, W.C., has been accepted, at 559*l.* 6s. 3d., for making up part of Wilton-road and Pigwell-path. The edge kerbs and flat channels are to be of Guernsey granite. No objection is to be raised to the proposal of Messrs. H. Bradford & Sons to erect eight houses in Wellington-road.

Ilford.—The following plans have been passed:—Messrs. W. Fletcher, Ltd., extensions to factory, Roden street; Mr. P. E. Brand, three shops and houses, Green-lane; Mr. W. J. Hobbs, thirty-seven houses, Cranbrook road: Messrs. Higgins & Thomerson for Mr. W. H. Knox, fifteen houses, South Park-drive.

Kensington.—The Borough Engineer has been instructed to prepare plans and estimates for making-up Kingsley-mews, Stamford-street, Balliol-road, and portion of Kellfield-gardens, as new streets. It has been decided to accept the specifications and estimates of the Taroads Syndicate, Ltd., for paving the carriageway of a portion of Addison-road with 3-in consolidated bituminous macadam, at a cost of 4s. per yard super. with free maintenance for a period of four years. The area to be dealt with amounts to 6,655 yds. A portion of the kerb, channel, and footway paving in Pembridge-square, and a portion of the kerb and footway paving in Cornwall-road are to be reinstated at an estimated cost of 127*l.*

Lewisham.—A portion of Brownhill-road is to be coated with tar macadam at an estimated cost of 1,097*l.* The following plans have been passed:—Mr. F. Howkins, eight houses, Cliff View-road; Messrs. Norfolk & Prior, five shops and houses, Perry Vale; Mr. J. Nicholls, eight houses, Manwood-road.

Marylebone.—It has been decided to provide a tower in connexion with the Council's new Town Hall.

Middlesex.—The Committee appointed by the County Council to consider and report what plans, if any, should be taken to provide further accommodation for lunatics in the county have come to the conclusion that further accommodation should be provided by means of a new asylum, and that steps should be taken to find a suitable site. The tenders of the Acme Flooring and Paving Company (1904), Ltd., at 4,305*l.* 13s. 9d. and 4,622*l.* 3s. 4d., have been accepted for renewing the wood-paving and substituting wood-paving for macadam, respectively, on the haunches of portions of High-road, Wood Green. The tender of Messrs. A. Fairhead & Son, Enfield, has also been accepted, at 14,975*l.*, for the erection of a county school and technical institute at Ealing. For the erection of additional cottages at Napsbury the tender of Mr. A. Pitkin, St. Albans, has been accepted at 2,835*l.* Certain enlargements are to be carried out at the Napsbury Asylum at an estimated cost of 355*l.*

Southwark.—The following streets are to be repaved with wood during the ensuing year at the estimated costs mentioned:—St. George's-road, 5,120*l.*; portion of Old Kent-road, 3,254*l.*; portion of Trinity-street, 1,000*l.*; portion of Southwark-street, 1,500*l.*; portion of East-street, 1,282*l.* The following are to be paved with asphalt:—Villa-street, 1,885*l.*; Tower-street, 1,641*l.*; Austral-street, 942*l.*; portion of Broadwall, 605*l.*; portion of South-street, 1,131*l.*; portion of Swan-street, 1,230*l.* The present granite setts in Collingwood-street are to be covered with granited asp
an estimated cost of 130*l.*, in accordan
an offer received from the Val de T
Asphalte Company, Ltd. Application i
made to the Road Board for a gr
12,000*l.* for asphalting Hillingdon-stre
repaving with wood Blackfriars-road.

Walthamstow.—The footpath in H
Hill-road is to be kerbed and paved
swimming-bath at the Public Baths is
shortened by 1 ft. 10 in. by filling i
concrete and facing same with tiles
following plans have been passed:—
Starkey, twelve houses, Blackhorse-lan
H. H. Iles, seventeen houses, Aveling
road; Mr. T. Baker, four houses, Wi
road; Mr. A. Pimm, four houses, Woo
road; Messrs. Allen Brothers, four
Malvern-avenue. Plans have been lodg
Mr. J. E. Ashby for the erection of a
in Blackhorse-lane.

Westminster.—The tender of Messrs.
Mowlem & Co., Ltd., has been accep
806*l.* for constructing a new sewer und
street, from Glasshouse-street to Regent
and maintaining same for a period
year. No objection has been raised to
posal of the Wolseley Tool and Moto
Company, Ltd., to carry out extensions
premises at Gatliff-road, Pimlico.

Willesden.—Plans submitted by the En
have been approved for making-up Do
ton-road, Harlesden. Tenders are to be
for carrying out wood and asphalt pav
four roads. The Engineer has been ins

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

✱✱ Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

PATRIOTISM AND ARCHITECTURE.

LTHOUGH the patriotic point of view so ably put forward by Mr. Voysey in his paper at the ectural Association is one which t safely be neglected, we are not ther surprised that he failed to carry neeting with him. As Mr. Keen enough points out, the appeal w.s to the feelings, and not to the ent of the meeting. Considering trength of this appeal and the stioned truth of so many of the ents on which it was founded, the at the meeting decided to exercise dgment adversely to his contention go far to persuade Mr. Voysey he present age does not show so an emotional tendency to swing direction—imitative or otherwise—appears to think. The present tion has largely outgrown the entalism of the previous one and ds an appeal to reason. It is endeavouring—if Mr. Voysey only believe it—to obtain that e between reason and emotion we agree with him is so necessary cess.

Since the break up of tradition we have no doubt seen style follow style in a procession of passing fashions founded on the sentiment or whim of the moment to which Mr. Voysey's accusations might rightly apply, but from this emotional tendency to swing in one direction after another we have at length discovered that something more than emotion or imitative faculty is required.

This, in our judgment, is the strength of the movement which Mr. Voysey deplores. It is a movement of mind, not merely a movement of sentiment; a movement towards the more intelligent study of foreign work, based on the solid foundation of reason and common sense.

We imagine that the days of indiscriminate and unintelligent imitation are over and done with, and that everyone now realises that, as Mr. Voysey says, "it is far more important to know from what general principles good work is produced than to have a knowledge only fitted to reproduce given examples." In spite of evidence brought forward to the contrary, we are convinced that this is the spirit in which foreign study is now undertaken, and in which great progress is now being made.

Unless we are to consider Mr. Voysey's contention to be a piece of special pleading deliberately put forward to provoke discussion, we cannot help feeling that he is tilting at windmills. The idols at which he throws mud are no longer worshipped with the same enthusiasm as heretofore. In assuming a shrine still exists in Tufton-street he hardly does justice to the intelligence of the members of the Association.

It is surely a question of intelligence, not of patriotism. Each and every member would wish to be as patriotic as Mr. Voysey himself, but fortunately, we think, for the future of architecture they appear to take a different view of the meaning of the word.

We must say we are not quite sure of the wisdom of introducing ethical terms into a discussion on art, but if we must use this word in relation to architecture, let us be very careful to discriminate. Patriotism in the real and highest sense of the word is a lofty and ennobling virtue, but in the lowest sense of the

word it is little better than a selfish, a stupid, and a degrading vice.

Of the patriotism that exalts country over self, that sacrifices all personal interests for the good of the State, we cannot have too much either in architecture or elsewhere; but it is just that narrow-minded, self-satisfied provincialism so characteristic of the lowest form of patriotism which is far more responsible for the deficiencies of our present-day architecture than are the crude attempts to profit by foreign experience upon which Mr. Voysey is so unnecessarily severe

If our architecture is in the future to hold its own as a fine art with music and literature, and to accurately interpret and adequately express the highest aspirations of the spirit of the age, it seems to need more of the virtue of patriotism and less of the limited outlook into which it so frequently degenerates.

Although we must all recognise that a building, growing as it does from the very soil of a country, is necessarily more affected by local influences than any other form of art, and though we all admit that we cannot ignore these influences even if we would, yet we have to ask ourselves whether all these various local distinctions of material or of method are really the essential qualities of architecture. Are the local peculiarities that differentiate a French from an English cathedral of the same date essential qualities or more in the nature of incidental or even accidental ones? Is there not some quality in architecture which, including all this, is yet above and beyond it, and is not this aspect of our art the one which is really of the most vital importance to us all?

Do not all the greatest masterpieces of art of whatever description rise far above the expression of local or even national characteristics? Do the symphonies and sonatas of Beethoven or the operas of Wagner appeal only to the national sentiment of Germany? Is a statue by Michelangelo typically Italian, or a portrait by Velazquez typically Spanish? If so, is this its essential quality—its *raison d'être?* Is it not rather its limitation—the measure of its distance from perfection?

Is it not enough for art to be simply human? To appeal direct to the heart of humanity, to the elemental instinct and feelings common to all nations and races alike? And does it not there find its only free expression and attain thereby its most overwhelming effects?

So in architecture it would be possible to imagine a Classic or a Gothic which, had it been free from arbitrary national limitations and divisions, might, by the combined effort of the whole of Western humanity, have attained to even greater height, and expressed even more clearly and forcibly those eternal truths which are independent of political or geographical divisions.

Although to the student or connoisseur of architecture nothing is more interesting and instructive than to trace the effect on the architecture of the past of the ever-varying groups or nations into which humanity has from time to time been divided, he is yet bound to realise that all such divisions are temporary only, and that the essential truths of architecture do not depend upon them.

Whatever the remote future may hold in store, nothing seems more certain than the general tendency of humanity in the immediate future to obliterate rather than accentuate all unnecessary distinctions, to combine in a few large confederations rather than to split up into many small sections, to endeavour by a free exchange of ideas to arrive at a general community of sentiment.

It is only reasonable to presume that if architecture is to keep pace with the upward progress of humanity that the same tendency must be visible here; but this tendency does not seem to be fostered by a deliberate ignorance of all ideas but our own.

The essential truths of architecture are founded on the essential facts of nature and of human life. Although no one would wish to dispute the obvious fact that local and national differences of sentiment must be considered, yet they must not be over-emphasised to the detriment of less obvious but more vital essentials. After all, such distinctions are only variations of the theme. The theme itself is architecture, not its local or national variations.

NOTES.

London University Site. MR. WILLIAM WOODWARD, in a letter to the *Times*, makes the suggestion that the Botanic Gardens, Regent's Park, might be considered a suitable site for the new London University. For reasons that have long been well recognised, these gardens do not fulfil their original functions, and their advantages as a site are reinforced by the proximity of the new Bedford College and the Royal Academy of Music. While we feel that this site would be far superior to the fragmentary and expensive areas at the back of the British Museum, the obvious disadvantage of the suggested position is its apparent isolation from other buildings, which creates an undesirable feeling of remoteness from the activities with which a university should be in touch; but this might easily be overcome, without great detriment to the Park, by including in the scheme a strip about 500 ft. wide, extending to York Gate, to be occupied by a fine approach avenue lined on either side by detached blocks of a monumental character suitable for occupation by various sections of the organisation. Provided it is not carried too far, the aspect of a cloistral seclusion is not altogether out of harmony with the purposes of a university, and up to the present we have not seen any suggestion that meets the conflicting claims so adequately as this one by Mr. Woodward.

Federal Capital City, Australia. THOSE who have sent in designs for the laying-out of the Capital City at Canberra will be specially interested in the announcement of the names of the adjudicators. They are Mr. J. M. Coate, surveyor (Chairman), Mr. J. A. Smith, President of the Victorian Institute of Civil Engineers, and Mr. John Kirkpatrick, architect, of Sydney, with Mr. C. J. Clarke, architect, of Tasmania, as Secretary. Apart from those di concerned, the whole profession will with regret that no pre-eminent arc has been appointed to assist in se the award. The status of the gentl composing the Board is high locall doubt, but for an international com tion of this magnitude and intere was desirable that eminent judges sh have been chosen from Great Br America, and Australia, if not fro Continent. These nominations sh have been made beforehand, of c and competitors should not have told merely that their work woul judged by "an engineer, an arch and a licensed surveyor." The co tition has been conducted in a that has not inspired confidence, a can only hope that the result wil by good fortune rather than by management, more successful than Commonwealth deserves. If it be we must admit that it would be having made the awards, to start a as a lesser evil than the adoptio all time of an inadequate and unsu scheme.

The Abuse of Advertising. THE Japanese have a well-earned reput for their genius in ada the ideas of other nations and efficiently putting them into pra Mr. Richardson Evans, the Chai of the "Scapa" Society, writes t *Times* that Count Hayashi during visit to England was so impressed the work inaugurated by this So for the protection of our scenery th determined to apply the same prin in Japan, and from the text of the published in Mr. Evans's letter it ap that the Japanese have now legisl on this subject, which is far more eff and practical than that provided in country by the Regulation of Adve ments Act, 1907. In saying thi must, however, in no way be take disparage the Act which was obt through the exertions of the "Sca Society. The full effect of that Act postponed from coming into oper for a period of five years, and, a pointed out in the *Builder*, Septe 22, 1911, great difficulty has experienced in drafting by-laws unde Act which shall be deemed *intra* There is now reason to believe that difficulty has been overcome, and the period of five years comes to a in August next the benefit of the will no doubt be experienced in country districts. Mr. Richardson E moreover writes that the Society is promoting a Bill which is intende secure "a reasonable standard of g dignity, and interest in the aspect o towns."

Street Accidents and Street Shelters. THE recent return rel to street accidents d the year 1911 furn subject for reflection. number of accidents k to the public in the United Kingdom 35,210, an increase of nearly 3,00 the previous year, this increase chiefly due to accidents caused mechanically-propelled vehicles. In the total number of street accidents only some 22,568, so in the seven

e street accidents have increased by arly 13,000. No doubt the mixed ffic with vehicles of different speeds s considerably enhanced the dangers the streets from both horse-drawn and tor traffic, but there is another con-eration to which attention may well drawn, especially in the metropolis. e street widening schemes which have n carried into execution during the t few years have rendered crossings re dangerous to nervous persons. A le thoroughfare crowded with traffic varying speeds is even a trial to the ongest nerves, and with the widening thoroughfares and the extension of ffic sufficient attention has not been en to the erection of street shelters. th a death roll of 410 and personal uries numbering 15,254 in the tropolis alone this is a question which ls for prompt consideration.

he Byzantine Revival.

Mr. W. G. Renwick, as quoted in the *Standard*, is not altogether happy in list of the architects responsible for resuscitation of the Byzantine style in modern work. Mr. T. G. Jackson and Mr. Bentley we recognise, but Mr. Bodley, Mr. Garner, and Mr. Fellowes-Prynne have concerned themselves far less with Byzantine art than many others we could name. Without mentioning others, Mr. R. W. Schultz and Mr. S. Barnsley are surely entitled to a place on such a list.

OLD HOUSES IN LINCOLN'S INN-FIELDS.

The old houses, with the archways under them, were for some two and a half centuries a familiar landmark of Old London. The passage communicated between Lincoln's Inn-fields and Duke-street.

The design of the façade has been attributed, not apparently without reason, to Inigo Jones, for it seems to bear much of the stamp of his grave manner.

The centre house at one time contained a mission-room and priest's residence, in connexion with the old church of SS. Anselm and Cecilia, which stood hard by, and doubtless, with its neighbours, looked down on many a strange scene, as when, in 1780, the Gordon rioters made a bonfire in the street of the furniture and fittings of the church.

The houses were demolished January, 1912.

Old Houses, Lincoln's Inn-fields, W.C. (now demolished).

From a Drawing by Mr. A. C. Comrade.

THE ARCHITECTURAL ASSOCIATION CAMERA, SKETCH, AND DEBATE CLUB.

At a recent meeting of the Camera, Sketch, and Debate Club of the Architectural Association Mr. Alan Snow read a paper entitled "Neo-Grec?" in the course of which he said:

"I shall endeavour to give you the arguments upon which I base my two contentions that a purely Greek style, with colonnades, pediments, etc., is absolutely unfitted for our uses and requirements, and that the manner of building at present known as Neo-Grec is not Greek at all, neither in the spirit of its design nor the actuality of its appearance. Those of you who have come expecting a prescription for the cure of all architectural ills will, I am afraid, be disappointed, for amongst these ailments I am of opinion that what most of us know as Neo-Grec should find its right place. I myself have a different conception of a new Greek style, which I will give you later on. Most past styles, as they have been left to us, are in themselves unsuited to modern conditions in England, but of them all it seems to me that Greek is the most unsuitable. The charm of Greek buildings is in their shape as much as in their detail; in their long and low proportion. How can we transplant this into the tall modern building? We may maintain the same general proportion in the building, although its size is greatly increased. But do we really imagine that by adopting in our larger edifices a similar treatment to that which the Greeks gave to their smaller ones we are perpetuating Greek architecture? We are not; we are deluding ourselves. Sometimes perhaps we may fitly use Greek forms for details, unless we can think of better, but even then they can only be used as a basis to work upon, not as a copy. Where we go so far wrong is in increasing the size of the details as we increase that of the building; in enlarging things that were only meant to be small; in using them as our models, the Greeks never used them, and in combining them with features which they either did not know or did not use.

Greek architecture in England is joyless and cold—as cold as the Greek costume would be, and for the same reason. It was designed for a warmer, sunnier land. This is felt even by those who attempt to practise it, as we can see by the way in which it becomes embellished. I was going to say enriched, but embellished seems somehow to express better the result we see. In this embellishment, and in the increase in scale already referred to, its Greek character disappears, the simplcity of Greek is gone, and in its place is richness and extravagance; the architecture is Romanised. We are doing just what the Romans did; we have turned our Philistine minds to Greek architecture, and produced a manner as far in spirit, proportion, and character from its beautiful inspiration as it could be.

What is the distinguishing characteristic of this great style? Is it not simplicity—a simplicity possible only because of the small size of even their greatest buildings? It is simple, too, because it adhered to one method only of building, and developed that until it could go no farther. It was so simple that we can use it in connexion with only one feature—the pier. The Greeks evolved two forms of pier, round and square, always used separately. The distinguishing mark of our latest Neo-Grec erections is the use of the half-round stuck on to the square, the reasonableness of which proceeding will not bear examination.

No modern building built in a purely academic Greek manner, using only Greek details and features, is Greek in spirit. Greek art itself would have been different in a different environment. Had we learnt truly the lessons left us by the Greeks we should never indulge in this literal, uncomprehending transcription of their style. We should not ignore all that has happened since—they did not. They did not invent an original architecture all their own. They, too, studied the past, and their understanding of study was the correct one—the selection and perfection of certain features. Study means selection. They selected one method of construction, not one manner of design, and throughout all the variations which they used it is never obscured, and the refinement and ornamentation which the crude essentials of this method underwent were all directed to the emphasising of the functions

of the various parts—the vertical lines of the columns, the horizontal lines of the architrave which they supported, and the projecting lines of the cornice. They evolved an "Order" of building, and only by a strict adherence to this was possible the perfection they achieved.

By a close and never-ceasing study of construction they developed their wonderfully beautiful architecture—as perfect a style as the world has seen, but not so perfect as to be universally applicable. We are told that "there is nothing in the world of art that is not Greek in its origin." This is not more true than that there is no one in this world who is not a descendant of Adam, and the one statement really means no more than the other. Everything has its beginning; even Greek had its origins, and that of Adam has been traced back to fishes, and even further, but I cannot see that either are of any account in considering modern conditions. Some may hold that the salvation of the world lies in a return to the conditions of Eden, and some the hope of architecture in a return to those of early Greece. I quite disagree with both, for neither can be right until the population of the world is small enough to be gathered together in either of these favoured regions.

The Greeks were able to pursue the study of one particular manner of building, and bring it to its very simple perfection, only by the comparative isolation of their land and the extreme simplicity of their mode of life. If we could live again as they did, well and good, but we cannot. In the hey-day of Greek art there was no unemployment, no competition. Each man was sure of a livelihood; each man was sure of the boundless leisure required for the completion of a perfect work of art. The land was self-supporting, and foreign intercourse was strongly discouraged during the great period of Greek art; nothing was needed, nothing obtained from other countries, either spiritually or materially, and the laws and customs were largely directed towards the restriction of population, thus avoiding the necessity of emigration. The commencement of the decline in all Greek art can be dated from the relaxation of these restrictions, from the time when the land ceased to be self-supporting. We can never return to this old Greek ideal of being sufficient unto ourselves in these days of enormous and shifting populations.

We can never return to the old Greek dependence on the most elementary of all forms of building construction. We cannot get away from the fact that we know more than the Greeks in every department of human knowledge. We may not be wiser, but we know more.

The greatest legacy that the Greeks have left us is their recognition of the æsthetic element in construction, and since their days the great successes of architecture have been due to great engineering. The Romans were great architects entirely because they were great engineers; there is little of real beauty in their buildings, but they are supremely wonderful, and wonder is one of the elements of fine architecture. We wonder at Greek perfection, and at Roman engineering, and at the marvellous combination of both that we call Byzantine. The men of the Middle Ages were great architects, too, entirely by virtue of their skill and daring in building, in the successful engineering of their materials; the history of mediæval architecture is one of continual engineering development.

It is most important to note that all of these great styles of architecture arose through continual experiment; therein lay their life. Renaissance, too, was a living art so long as it remained true to experimental construction. Immediately it was assumed that this had reached its final stage, immediately architecture became academic and merely a matter of adaptation, then all life and joy departed from it.

In Greek and Roman, in Gothic and Byzantine supreme art accompanied supreme construction. We shall see that this must be, as the perfect craftsmanship and clear vision that are necessary to achieve greatness in art are the very qualities necessary also for the achievement of greatness in construction. To this fact is due the feeling that comes to us when contemplating the great monuments of the past—a feeling that they are inevitably what they are—that they took the shape they did not through the conscious caprice of their builders, but through the force of circumstances beyond their control. They were as much the product of their age and circumstance as the feudal system, party politics, or the steam locomotive of theirs. It is through this feeling that as they are so must they have been that we derive the satisfaction and contentment that is ours in their contemplation. We view with equal pleasure the Parthenon, the Pantheon, or Notre Dame, unless we are architectural bigots, and to these I may add the Forth Bridge and the Gare d'Orléans—classic instances by now. This pleasure is not one peculiar to architects, but one shared by them with anyone of susceptibility—anyone capable of intellectual pleasure. In short, these great buildings are not merely beautiful, but they are significant—they have a meaning and a beauty apart from the decorative forms in which they are clothed, forms in themselves accidental. It is this significance that raises them to the highest plane as artistic achievements. To adapt a paragraph from Baldwin Brown's "The Fine Arts," "their harmonious subdivision and play of part against part, which make the life of their architecture, was readily evolved from the constructive forms that had their basis in utility." It was by the arrangement of their essential constructive forms to secure the greatest convenience, economy, and strength that they obtained their splendid results—by what we understand as planning.

Is architecture going to stand alone? Is our "modern style" to be the first of all to separate itself from the intellectual life of the age? Or are we going to be Neo-Grec in all our arts? Shall we breakfast with Neo-Grec porridge plates, take tea from subtly-moulded Neo-Grec cups, go to sea in Neo-Grec galleys, and clothe ourselves in scanty, if picturesque raiment? This is no frivolity; an art that has anything in it should permeate the whole artistic life of the nation, and certainly its devotees, if sincere, should be prepared to see it do so, and wish that it should. Are you prepared for this? Do you wish that it should happen? If you are, and do, I can do nothing for your case; if not, you stand condemned. Art is thus reflected in all the life of ancient Greece, and in Roman, Byzantine, and even Renaissance times. Cannot we all identify the smallest thing dating from any one of these periods? Are we to mount even higher on our pedestals, from which Mr. Burns recently and quite justifiably beseeched us to descend?

St. George's Hall, an unique building, was brought into being by an unique problem, and it and other similar buildings are no material for argument either for or against a general adoption of the style, any more than is that other unique building, the Liverpool Cathedral, in itself a justification for the condemnation or universal adoption of Gothic.

The only real argument for the adoption of Greek would be that its forms can be so arranged as to obtain qualities otherwise impossible of achievement. Apart from the fact that argument of this character places architecture no higher than scene painting or mural decoration, it is certainly not the case. Fine architecture has another set of principles to which it must adhere—fitness to purpose, climate, and other conditions peculiar to each country. With these as our guide, all that can be urged for Greek can be urged for any other style; it becomes merely a matter of personal predilection, and not of principle at all.

We may feel from the study of Greek that all other architecture is incompletely worked out, but why throw up the sponge? Why not work it out? Why not attempt something? Might we not find that we too had produced something worth while? Or are we just to take the easy road—to quiet our architectural conscience (there is such a thing), and steal and borrow our architectural forms, stifle our architectural intellect and kill originality of thought?

"There is no substitute for thought." Every reference to the past should increase the mental labour of the inquirer, not serve as another modern labour-saving device, as it so generally does. He must endeavour to find out why each feature that he examines is as he finds it; discover its purpose and determine its suitability both for that and the use which he proposes to make of it. By such methods it should be possible to build up a satisfactory philosophy or Order of architectural design; by so doing we should arrive at a method of building beautifully that would be truly Greek in spirit—of which the plans and constructive forms would be absolutely modern, but nevertheless profoundly influenced by past achievements. In it we might well find that many of the details were based on Greek forms, simply becau
certain features were so well studied by t
Greeks and brought by them to such perfectio
that we are hardly likely to be able to impro
them. Such a modern style would include n
only the post and lintel system of buildin
which is all that the Greeks bequeathed to t
and which alone is far too small an equipme
for our requirements, but also the round a
pointed arch, the vault, and the dome.

Must we fall back on engineers for constru
tion, and Greek and Roman for our clothing
it? Have we no wit or imagination? The
is more charm and originality in Georgian th
in this revived Roman. It is the great fault
the average architect that he does not ta
advantage of his opportunities as an artist
that is, he does not set out to create somethin
but at the first opportunity harks back to wh
someone else has done, both constructively a
decoratively. How can his art improve if
accepts the conclusion that the best has be
done, and there is nothing left for him to do b
adopt and adapt the ideas of other men? If
really thought this I would never have becon
an architect, but rather an engineer or a pla
wright. To be so hide-bound and fetter
would be intolerable. We are not free to do
we like—far from it—but there is no need to
imprison our intellects. That is what seems
me most missing in modern English architectu
—intellect—the mental grappling with a
overcoming of our problems. We are still
much amateurs as Lord Burlington, with n
one-half of the excuse."

ARCHITECTS FROM GEORGE IV. TO GEORGE V

A MEETING of the Glasgow Institute
Architects was held on February 14, whe
Mr. Maurice B. Adams read a paper on th
subject, from which we take the followi
extracts:—

"Evolution in design had spent itself by th
time of George III. No tradition wor
mentioning remained, and our most accon
plished achievements henceforward were du
to individual example. Academicalism ha
reigned long enough. "The Neo-Class
period," which has been divided thus, e
tended from 1666 to 1820; the Formativ
period, from 1666 to 1720; the Palladia
period, from 1720 to 1760, and the Form
school, which ended in 1820. War and fi
have generally contributed to the advance
architecture, and since the era of the Middl
Ages the one outstanding event which had th
most immediate influence upon subsequen
building art in this country was the Gre
Fire of London in 1666. Wren thus was give
his opportunity, and although the governin
authorities then failed to realise theirs, in n
adopting Sir Christopher's plan for the la
out of the metropolis, the great thing that di
matter was his rebuilding of St. Paul's an
his many churches in the City, not forgettin
Greenwich Hospital. The second conflagra
tion to be mentioned as of architectura
import was the burning of the old Houses o
Parliament in 1834. These two event
coupled in this way define the beginning an
the end of the "Neo-Classicism" of Englis
building. Till the turn of the tide of fashio
towards the closing years of the last century
indigenous architecture became associate
more or less with the "Gothic revival." S
little attention indeed was devoted fifty yea
ago to Classic work that it would hav
acquired an inspired prophet to have foretol
the change which our children have witnessed
and no one could have thought it probabl
that the praise of Soane and his school woul
find expression in the early days of th
XXth century. Belcher and Macartney
book on "The Later Renaissance" helped t
bring about this swing in the pendulum
Long prior to the Georges, beauty, colour
and grace had succumbed to the Puritan
the Revolution, and the iron hand
Cromwell. Houses were grey, with flat roof
and hopelessly dull interiors, although som
of the better sort exhibited a somewha
architecturally contrived plan, recognisin
vistas by making one room lead out
the other. A reaction so early as the daw
of the XIXth century evinced signs
activity, but so little was mediæval art com
prehended that it was generally spoken of a
"the English style," ignoring the historic ar
of Europe. Wyatt was building Fonthil

ey, known as "Beckford's folly," on an mous scale with puerile and petty detail, an advance was registered when John v erected the clever church of St. stan's in the West in Fleet street, and ed a respectable deception to Christ's pital in so-called "Gothic." The new ts of St. John's College, Cambridge, ribed as "a monstrous pile of ugliness," put up by Thomas Rickman, the Quaker, hom we owe the invention of the nomen- ure of the English Periods of Archi- ure in his "Attempt to Discriminate," ished, with "The Classic Orders" as a ace in 1819. Porden had built Eaton , and Atkinson, a pupil of Wyatt, carried "Abbotsford" for Sir Walter Scott. ustus Pugin with Le Keux informed the ated public by their illustrations of mandy and other mediæval work, thus ng the way for the turbulent crusade nst Pagan inconsequence so vigorously rtaken by Welby Pugin, whose graphic *rasts* and *True Principles* did so much ice later on. His energy was attributed hat "Classicists" called his "Whimmery, ' e his critics applied to him the sobriquet Smell-fungus," and so "the battle of the s" began.

Samuel Prout and Others.

nterior to that event there lived, quite rt from this battlefield, a delicate and sically fragile individual of retiring perament, devoid of technical training, single-handed wrought a revelation liscovering and popularising the charm the picturesque in such common thing; old cottages, and so opened up the ibilities of simply befitting countryside estic architecture by which English archi made a world-wide reputation long years Samuel Prout, the man I mean, had forgotten and reckoned as a bygone. t man of his century dreamed of the isite beauty existing in the unsophisticated, bledown, neglected smaller Tudor and rt built dwellings of the husbandman re Prout made his brown-ink and reed "dotted and blotted sketches?" Piranesi, doubt, and Rembrandt, too, with such ies as his "Mill," had extended influences, Cotman and others, towards a truer eciation of the higher forms of architectural resqueness, and Piranesi's Baroque com- ions told in an imaginative direction. *Beauties of England*, edited by Britton illustrated by Prout, filled a mission in way I have indicated, at a time when forefathers displayed an intense ignorance chitecture. Wood, of Bath, and Le Roy, aris, exemplified the spirit of refinement esign which found expression in France he buildings designed by Gabriel, also in lon and Edinburgh by Robert Adam, the tasteful architect of his day, but his ner, for varied reasons, failed to find y imitators. The Adelphi Adams were nsively engaged at the time by the lity, and by speculating, too, on their own unt. Thus they enjoyed opportunities ed to Stuart and Revett, while Joseph omi only had a restricted practice in h his skill was always manifest. Thomas rton did more, and was associated with lay-out of London squares. Sir John e, the master of commonplace Greek, and essor at the Academy, designed a scheme he House of Lords, was much in favour, ed the Bank of England, and left a most llent museum. John Gandon, pupil to Wm. Chambers, displayed a much higher city when he won the competition and the Custom House and Four Courts at lin. The expiring embers of the XVIIIth ury had not been extinguished without a lden flash of the Baroque, the Rococo ing concert with the vagaries of the amentalists, who fancied architecture isted of so much applied enrichment more ess. They published pattern books, and ing inspiration from Peking, also intro- d red lacquer work for furniture and rations. For portable pieces some of work is very charming, and certainly the ese wall-papers imported at this time most beautiful, brilliant, and durable. Chinese room at Blickling Hall is an mple in point.

he culminating extravagancies of George were encouraged by John Nash when ding the Regent's plaster fabricated Palace known as the Royal Pavilion, Brighton. This vogue for extraordinary diversions was thus exploited, but it was not all vulgar, and many of the appointments in glass, both in form and colour, were most clever; also the grotesque gilded carvings in this seaside palace were in their way excellent.

It strikes one, in reading about the blatant etiquette and expensive social comedy of Court life in Europe then, how incongruous the common conveniences of their everyday doings were, and their total disregard of the most elementary requirements of sanitation. The recognition of light and air was equally unthought of in the frosty upholstered, unventilated, pretentious dwellings of society, with their *bric-à-brac* better suited to the inventory of a stage wardrobe, though they exhibit the taste of their day. No doubt, some of the more stately dwellings, such as the Bishop of London's mansion in St. James's-square, are marked by architectural refinement of plan; and S. P. Cockerell, its architect, was a most cultured man. A few West-end residences of the same decade show the same distinction, but there was a prosaic order and colourless proportion about these decorous façades. James Wyatt, who acquired a big fortune, flattered by Walpole for his Gothic work, following up the Græco-Italian style, designed the "Pantheon" in Oxford-street; and Wyatville, R.A., invested, midst Edwardian surroundings, the incongruities of the Empire style at Windsor. His diploma drawing at Burlington House, showing a bird's-eye outlined view in Bistre of a mansion for the Earl of Yarborough, dated 1826, is no mean performance. W. Wilkins, R.A., built the National Gallery in 1832, and the British Museum, by Sir Robert Smirke, was commenced in 1823. John Dobson, of Newcastle-on-Tyne, erected the famous station there and laid out the town for Thomas Grainger. Dobson, by the way, was the first architect allowed to exhibit a coloured drawing at the Royal Academy. Up to 1815 architects had to be content with black-and-white drawings. Whatever niche may be accorded to Sir John Soane in Architectural History, he will not be best remembered by the box-like galleried tabernacles which he put up. St. Peter's, Walworth, filled him with such pride that he reproduced it later at Holy Trinity, Marylebone. The church was one of his best, and Walworth in 1824, when it was built, ranked as a fashionable suburb for the residences of merchants. St. Pancras parish church, by the Inwoods in 1822, famous for its Greek style of course, leaves Soane miles behind; but then St. Pancras church cost 100,000*l*., and Marylebone church cost nearly as much. University College, Gower-street, by W. Wilkins, dates from 1827.

Two years later the Travellers' Club displayed a remarkable departure by Sir Charles Barry, who had then returned from Italy fully impressed with the Farnese Palace, and Wolfe, a pupil of Gwilt, had systematised his method of study, inducing him to forego his fancy for Egyptian hieroglyphics covering mural surfaces with enrichments. Thus inspired from Italy, Barry also designed the Reform Club in 1837, and Bridgwater House in 1847. His early taste for redundant ornament reasserted itself in Barry's Gothic work. Liverpool was ennobled by the building of St. George's Hall, H. L. Elmes, a pupil of his father, being its architect, who died early. By his last wish Professor Cockerell finished the building. Cockerell, foremost as a brilliant "scholar architect" and exponent of the higher school of theoretical classic, erected the Taylorian Building at Oxford. George Basevi carried out the structural shell of the noble Fitzwilliam Museum at Cambridge, and laid out Belgrave-square. Hyde Park screen witnesses to the refinement of Decimus Burton, the architect of the Athenæum and United Service Clubs, Pall Mall. Sir William Tite commenced the Royal Exchange in 1844, which, it is said, owned a natural parent not recorded in the register. The west side of Somerset House was added a little earlier by Sir James Pennethorne. A considerable influence on façade treatment about this time was due to stucco, one of the most useful and ancient of materials; but cements are modern, and to what base uses have they not been put? It may be useful to give a date or two. Coade's patent stone dressings were used in 1771 by Leverton in Bedford-square. Robert Adam employed Liardet's cement for external ornamental work both in Fitzroy-square and the Adelphi. Parker patented Roman cement in 1796. Portland cement, invented by a bricklayer named Aspdin, was patented in 1824, and Keen's cement was patented in 1838. Nash is accorded the credit of having introduced the "stucco style" by his quadrant and building of Regent-street. Patent selenitic cement was invented by General Scott, 1870. There is also another practical matter which cannot well be omitted, and it may be mentioned here. However, at the moment I should like to point a moral as to *esprit de corps* by saying that Wyatville, a much-maligned man, merits our respect as an examplar, because when the tipsy Regent wanted to get rid of Nash as architect of Buckingham Palace by electing Wyatville in his place, the good man declined to supplant a brother architect even at a Royal "command." I have known architects who might still learn a lesson from the disparaged Wyatville.

The Gothic revival was a tangential departure, and not an evolution by which in imperceptible degrees one style grew out of another. The result was chaos, and it would be difficult to decide as to when and to whom emancipation was due. A certain class of progressive antiquarians even now assure us that darkness prevailed till the advent of the pre-Raphaelites. Others date our Renaissance from the birth of the Arts and Crafts Society, fortified by the archæological cave-dwellers of the anti-restorationist crusade. We might perhaps be more convincing to them if we spoke slightingly of "the so-called Gothic revival" which was brought about after Prout had touched the heart of the public and unsealed its eyes to the picturesque. Pugin, with his doubtful analogies, and Ruskin, with his false taste for Naturalesque sculpture in ornament, had at least instructed and roused public opinion. The educated classes were thus prepared to co-operate, and architects, to make themselves fit, measured details and studied mouldings, but somehow missed the inspirations of the mediæval soul, as they borrowed fragments which became lifeless and uninteresting.

Barry and Pugin.

When the Government advertised the Houses of Parliament competition in 1835 the conditions prescribed "Elizabethan or Gothic." Four premiums of 500*l*. each were offered, and ninety-seven competitors sent in plans. Charles Barry won the prize, and was forty years of age when King William IV. confirmed the award of the Commissioners and elected him architect early in 1836. The Classicists fought against the verdict, and Welby Pugin, who had not competed in his own name, plunged into the subsequent fray with all the ardour of his enthusiastic temper. Barry and Pugin had previously co-operated when King Edward's School at Birmingham was built in 1833, and it was in that building that Barry discovered Thomas, the stone-carver who carried out so much of the work at Westminster. The controversy as to how far Welby Pugin was the author of the Houses of Parliament ended, as it had begun, in the conclusion that the general conception and magnificent lay-out of the plan belonged to Barry, and that Pugin detailed it. The foundation-stone was laid in 1839, and it is evident that Barry's love for Egyptian surface enrichment favoured Pugin's encrustation, so to speak, of the façades with endless florid detail. The conception of the scheme is eminently classic in its distribution, which shows Barry's personal predilections for balanced symmetry. The Birmingham school just named precisely illustrated the same combination of authorship.

Everyone knows what an excellent draughtsman Welby Pugin was, but those who are not familiar with the drawing in Ferrey's "Life" of this great architect may not remember that at so early an age as thirteen Pugin made a first rate sketch of Christ Church Priory, realising the architecture of that remarkable building fully expressed. A bird's-eye of his church and convent at Ramsgate is included in the Phené Spiers's collection of historic drawings hung in the Victoria and Albert Museum.

While Pugin was busy in 1837 with the drawings of the new Palace at Westminster,

"in the composition of the river front," the centre wings and tower, he was engaged in erecting St. Mary's College, Oscott, and Scarisbrick Hall. Simultaneous entries in his diary show this beyond question. His first church was St. Mary's, at Derby. Talbot Bury and Benjamin Ferrey I knew, and having worked with Pugin for Barry, they all three gave Sir Charles the full credit for his design as a whole. The work carried out all over the United Kingdom by Welby Pugin stands as his best evidence of his claims, as at St. Gregory's Priory, Downside, the cathedral-like church near Hereford, and St. Chad's, Birmingham. Three churches at Liverpool, more at Manchester, Leicester, Cambridge, and St. Giles's, Cheadle, which for its size was the most costly of them all. Killarney and Newcastle show others. Lord Dunraven's seat at Kildare in Ireland, and Bilton Grange, Warwick, his domestic work. The Pugin Travelling Studentship, founded by subscription at the R.I.B.A., was first held in 1865 by Mr. Tavenor Perry, who built part of the Hotel Cecil, facing the Embankment.

Sir George Gilbert Scott.

Sir George Gilbert Scott, at the outset of his career, erected many workhouses and such-like buildings, and other Gothic celebrities, like S. W. Dawkes, who had erected Colney Hatch, and Benjamin Ferrey, who built Dorset County Hospital in 1839 Scott was articled to Edmeston in 1827, and in 1834 helped Kempthorne, an expert in workhouse projects, after serving a time with the builders, Peto and Grissell. Scott's connexion with Moffatt began in 1835, after which the firm went in seriously for Poor Law enterprises, and carried competitions before them with businesslike foresight in such a way as to obscure some other considerations. Influenced by Storer's "Cathedrals," which came out in 1814-19, Scott turned his attention subsequently to mediæval work, and the Cambridge Camden Society woke up matters in favour of ecclesiology, which was inspired largely by Pugin. Curious to relate, Gilbert Scott obtained his first church, St. Mary's, Stafford, through his connexion with the Poor Law Commissioners. He had realised the shortcomings of the Gothic church at Windsor, built in 1822 by C. Hollis. This building was remodelled by Teulon in 1869 internally.

Scott characteristically went in to win, and so adopted a popular style, as at St. Mary's, Wakefield, and he won much favour by his capable church of St. Giles at Camberwell (1841), also by securing by competition Hamburg Cathedral in 1844, on which design he had the help of Coe and Street. The Camden Society, being more liturgical, advocated Butterfield and R. Carpenter. Churchmen looked askance at Scott's partnership methods with Moffatt, which connexion was concluded in 1845. Scott obtained the surveyorship of Westminster Abbey when Blore retired in 1849. The Chapter House was restored by Scott, who built the new north portals. The upper part of this transept façade was the beautiful design of J. L. Pearson.

In 1853, Scott built the much-talked-of church at Doncaster, when E. B. Denison, afterwards known as Sir Edmund Beckett, and subsequently Lord Grimthorpe, acted as candid friend, giving Scott much to interfere with his devotional exercises. The west window, erected years afterwards by Grimthorpe at St. Alban's Abbey, with an arched sill added, was based on Scott's Doncaster design, which Denison twitted Scott for borrowing from elsewhere.

The competition for the Foreign and Colonial Offices in Whitehall was taken part in by 218 other architects, and I have already mentioned how Scott was chosen, and how he was served, but I did not say that Sir Digby Wyatt's work was confined to the interior of the India Office, the contrivance of some rooms badly fitting the exterior, but much of his ornament is extremely clever. It is impossible in a paper of this kind to do justice to such a personality as Sir Gilbert Scott. His work was enormous, and his capabilities such as would have made him distinguished in any age.

The Architectural Museum.

Sir Gilbert Scott founded the Architectural Museum in 1851. It originated in the sale of Cottingham's Collection and was based on Bruce Allen's idea of a school of applied art for workmen. Street and Butterfield did not encourage the project, but Alfred Waterhouse and Mr. Norman Shaw always supported it. Scott engaged Gerente, of Paris, to get together a vast number of fine casts from France. Sir Bartle Frere gave a splendid collection of marble reliefs from India, Ruskin added more carved treasures, also his Venetian collection. Joseph Clarke, Ewan Christian, and J. P. Seddon proved its best friends. A wharf was rented in Cannon-row, and here the Earl de Grey presided in the cockloft while Ruskin lectured and Bereford Hope found the ways and means. The casts were removed to South Kensington, then in its embryo stage, under Henry Cole; but the museum casts were too much absorbed by the larger assemblage, and so later they were brought back to Westminster, where in Tufton-street the Museum quarters had been erected by Ewan Christian and Joseph Clarke as hon. architects. To provide a home for the Architectural Association day and evening schools in 1902, I proposed, and, with the concurrence of the Museum Council and subscribers, brought about the free gift of our buildings and their contents, subject only to one condition, viz.: "that the Architectural Museum should be maintained for the free use of the public as heretofore for ever."

Having referred to the professional societies of architects, to the 1851 Exhibition, and the work of Paxton, and Sir Henry Cole, the lecturer dealt with William Butterfield, J. L. Pearson, James Brooks, G. F. Bodley, and others.

William Burges.

As to William Burges, the lecturer said:

"William Burges I also knew personally. His wonderful house at Melbury-road is worthy, like the Musée Plantin, Antwerp, of belonging to the nation. It is incomparably more interesting than Lord Leighton's house, of which so much has been said, though no doubt the Arab Hall, with its old Moorish tiles, is very beautiful and interesting. William Burges joined H. Clutton in a competition for Lille Cathedral in 1856, which they won. Street took the second prize, and he said Burges was so familiar with French prejudice that he had taken the precaution to use French paper, and, as Street thought, thereby obtained undue advantage. The drawings anyhow were so quaintly executed that Viollet-le-Duc at first believed, when he visited the competition, that Burges's drawings were some old ones of the XIIIth century, till he discovered "Whatman's" water-mark in the paper. Either Street or Viollet-le-Duc was wrong. The church at Lille is a wretched building, boiled down from Burges's and Street's designs, and erected by a local man named Leroy, Burges and Clutton having been got rid of. The designs of William Burges were always thorough, including the most minute detail. His design for the Law Courts was architecturally by far the best. The scheme which he made for decorating St. Paul's Cathedral by a veneer of marble was shown at the Royal Academy in 1873. Burges's design for Edinburgh Cathedral would grace any period of art. E. W. Godwin, F.S.A., like his personal friend, William Burges, imported French Gothic mannerisms, and exercised a great influence on his fellows, though considering his genius, Godwin's career individually was largely a failure due to his own personal shortcomings. Congleton and Northampton Town Halls, Dromore Castle and Glenbigh Towers, some work at Canons Ashby for the Marquis of Northampton are his designs. He won the first competition for the Town Hall at Leicester and built Whistler's house at Chelsea, and others at Bedford Park. Godwin created a style of his own, and took up Japanese art with ability. As a writer of literary accomplishment and as an authority on costume and dramatic staging he was unsurpassed.

George Edmund Street.

George Edmund Street, R.A., the builder of the Law Courts, was in every sense a great architect. Bristol and Christ Church Cathedrals were partly rebuilt by him, and, he told me that when the Dublin work was in hand a detail for the entrance arch was asked for. He drew it out on the spot, size. As the structure proceeded a fragm of the old arch was subsequently found wh proved to be identical with the profile he supplied, so scholarly was Street's kn ledge. His design for Edinburgh Cathe was an excellent performance, a rem which applies to his fine churches at Kenn ton, Paddington, Eastbourne, Clif Bournemouth, and Oxford, also St. Jar the Less, Westminster, and the convent East Grinstead. Like Barry and Sc Street was buried in Westminster Abb Bodley designed the brass over the grave.

Domestic Work.

The lecturer then referred to some re and present church architects, and to c buildings of recent times and their archite Proceeding, he said:—

"English and Scotch Domestic work exceeded in merit all foreign competit and it bids fair to reach a more gen application as men learn to omit sense detail and elaboration, depending inst more on outline and good proportion; the Gothic spirit must be retained to k it virile and adapted to modern requirem and domestic comfort.

The introduction of ferro-concrete c struction and the facility of transport materials as well as the introduction specialists' building appliances have not c quite revolutionised the contracting tra but settled for ever the influence of l materials on work in different parts of land. Curiously enough it is the me politan architect who now is most kee anxious to retain indigenous modes and revive traditional local styles should he employed where any once obtained. native architect, as a rule, perhaps to imp what he does with what may pass as be up to date in style, emulates what he assu to be the last phase of fashion in town illustrated in the professional journ This is a matter of keen regret. A hund years ago architects were often builders well. The Brothers Adam, like many prominent architects, undertook to prov completed buildings. Now, architects hav increased in numbers beyond all hope lucrative employment, too much work is be expensively handled wholesale by munici trading schemes on the one hand and emporium furnishing firms or stores und taking architectural work on the oth Registration is being pressed forward a remedy. It may help the practitioner e if it does not improve architecture as an for that depends upon the artist, whose s is a matter of birthright and not le enactment.

Restoration.

No retrospect of the past century reasonably be complete without some ref ence to the vexed question of restorati which with all its disastrous results, carried out in the earlier Victorian per with far too big a letter R; it destro much that was historically valuable artistically beautiful by well-meaning ent siasts who scraped and spoiled many a no building at enormous expense without rec nising the value of architecture and her ha maidens in craftsmanship. We are all agr about that, and now, let us hope, no capa architect would do anything of the sort deplore. The pity is that the Protection so seldom do anything to preserve a build from thoughtless neglect, and in their g to prevent an architect from touching an church to make it more fit for contempor worship, they forget that rack and ruin going on elsewhere unheeded, and no eff made to save and upkeep all kinds of e more valuable remains, which, if left alo will soon remain no longer."

THE ROAD BOARD.

During the months of January, Februa and March, 1912, the Road Board, with approval of the Treasury, have m advances amounting to 88,992*l.* from Road Improvement Fund to county coun and other highway authorities. The Boa have also intimated that they are prepa to contribute, subject to the approval the Treasury, 875,000*l.* towards the constr tion of a new western approach road London.

TTAGES AT ST. HELENS, HASTINGS.

is building occupies an elevated and ed position overlooking Hastings and the The southern aspect and view has ly governed its general disposition. The gements are dictated by rather unusual rements. Although planned as two ges, they communicate on the first floor are technically one building; but the ing wall has been taken up through the in deference to the wish of the local orities. The materials are a local clamp of rough texture, varying in colour, but icing a general effect of a low-toned red, with red-brick arches and green . The cost, not including garden ning wall and slips, was 568*l*. The ers are Messrs. J. Lester & Sons, of ings, and the architect is Mr. A. R. nett.

THE OCIETY OF ARCHITECTS.

a meeting of the Society of Architects, on Thursday, April 11, a paper, entitled es on Some Principles of Professional ice and Suggestions for a Code of Ethics," ead by Mr. C. McArthur Butler, F.C.I.S., tary of the Society. In the course of his rks he said:—

propose in the first instance to make a reference to the practice and custom pre- g in other professions, then to consider is being done by architectural bodies, quently making a reference to some of the principles which it appears to me should n architectural practice, finishing with suggestions for procedure and for the of a schedule of practice and a code of

Custom in Other Professions.

eed only refer in passing to the professional ette prevailing in such professions as those y and medicine, the code applying to the being probably one of the most stringent, ich so that from a perusal of letters in the e Press one is led to think that the line sometimes be drawn to an extent which appear to amount to an injustice in n cases.

Among the numerous institutions representing the engineering, surveying, and allied professions in the United Kingdom the only one, so far as I am aware, which has a code of ethics as well as by-laws is the Institution of Civil Engineers, whose procedure in this respect is being closely followed by the Institution of Electrical Engineers and by the newly-formed Association of Consulting Engineers.

I understand that the American engineering institutes adopt similar methods.

The opinion has been expressed that in some cases, such, for instance, where an institution is called upon to act in a judicial capacity in dealing with complaints regarding professional etiquette or misconduct, a code might limit and hamper that institution in the performance of these duties, but the general feeling appears to be in favour of a code.

The Attitude of Architectural Societies.

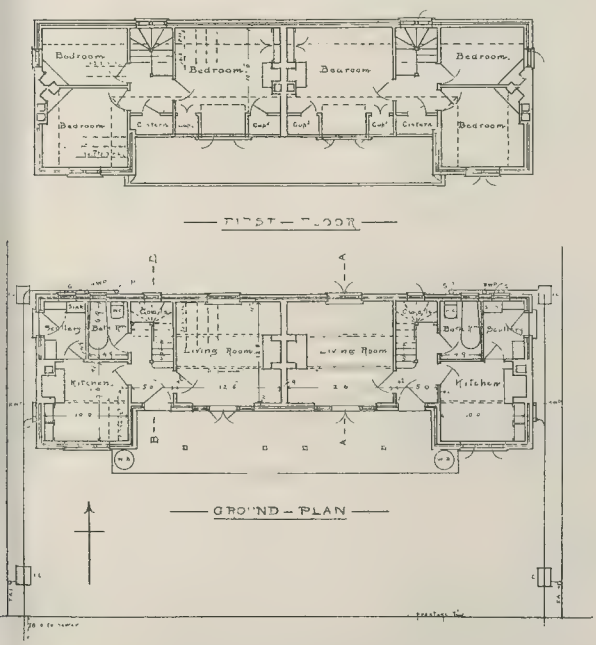
We will now consider the custom is regard to architectural societies, noting first colonial and continental practice.

The American Institute of Architects offers to its members advice relating to the principles of professional practice and puts forward a canon of ethics.

The architectural institutions of Australia are co-operating in compiling a code, while the one issued by the Central Society of French Architects has, I understand, been adopted by other French architectural societies.

In South Africa similar measures are being adopted by the various associations of architects, and in Canada the Royal Architectural Institute of Canada and other associations of architects, which are rapidly springing up in that progressive Dominion, have each their code of ethics, administered in most instances. I believe, under an Act of Parliament.

Architecture is one of the few, if not the only one of the great professions, the practice of which at home is not regulated by Act of Parliament, and probably it is the only one which is split up into so many institutions and societies, all having very much the same general aim. There are, for instance in London the Royal Institute of British Architects, the Society of Architects, and the Architectural Association, and in the provinces there are seventeen architectural societies allied to the Royal Institute, besides several at present unattached and others in course of formation. All these societies have by-laws which enable them to deal with specific charges against their members, and in most cases a member on joining has to sign a declaration against illicit commissions as well as an undertaking to keep the regulations.



The allied societies, as one would expect, are practically in every case governed by the general practice of the R.I.B.A. as contained in the resolutions published in their *Kalendar*. These relate to the signing of buildings and display of names by architects, the making known to the client of the architect's interest in materials or devices used on buildings, the question of supplanting other architects, and the payment for the quantities by the client (a matter dealt with in the schedule of charges), and also include the recent regulation relating to participation in architectural competitions.

The Effect on the Profession.

Thus we find the architectural profession as a whole at present without any generally and publicly recognised schedule of the principles to be observed in practice, no publicly recognised competition regulations, no publicly recognised scale of charges, and no publicly recognised penal code, the regulations which are at present in force, excepting the one relating to competitions, being more in the nature of expressions of opinion and relying upon custom for their enforcement—so far at any rate as they relate to unattached architects.

Each member of the profession may set his own standard and is not amenable to any discipline beyond that implied in his voluntary obligation in respect of the rules of any professional body to which he may belong, which are usually confined, as previously stated, to a declaration against illicit commissions (now probably rendered unnecessary by Act of Parliament) and an undertaking to keep the rules, the most important of which, in the opinion of the member concerned, is probably that relating to the payment of dues.

In the rare cases, if any, where action has

Cottages at St. Helens, Hastings.
Mr. A. R. Jemmett, F.R.I.B.A., Architect.

been taken by an institution not acting under statutory powers against a member for unprofessional conduct removal from the roll of such institution on this ground, so far as the public or even the profession beyond those immediately connected with the case is concerned, has no more effect than if such removal was due to the relatively milder breach of the rules relating to the payment of the fees, seeing that the reason of the removal of the offender from the register is not made public, nor is he thereby debarred from continuing to practice.

The unattached architect, whose name is legion, has not even this deterrent, and is under no control within the limits of professional matters.

Suggestions for a Remedy.

This state of things can be remedied to some extent, and at present, so far as architectural societies are concerned, by the universal adoption by them of a schedule of principles and a penal code; but the unattached architect still remains uncontrolled, and, in my opinion, the only effective way of dealing with the whole matter is by statutory powers such as would be provided under a Registration Act.

Is it desirable under these circumstances that a schedule of practice and a code of ethics should be instituted for the architectural profession, and, if so, on what basis should the latter be drafted, bearing in mind the fact that architectural societies reserve to themselves power to regulate, if only to some limited extent and on certain points, the conduct of their members, and that it would appear that by laying down wider regulations they might possibly be hampered when dealing in a judicial capacity with these matters?

In my opinion, the desirability in principle for a schedule of principles of practice and a code of ethics is admitted, and that what is good for the societies concerned may be held to be good for the profession generally.

Here, however, we are faced at once with the difficulty already referred to, of dealing with that considerable body of architects outside any architectural society, who possibly could not be expected, and certainly could not be obliged to adhere to any general schedule or code, nor against whom could such a code be enforced in the absence of any controlling body representing the whole of the profession and vested with statutory powers.

A Board of Professional Control.

In the absence of, or in the anticipation of, such a controlling body as would be constituted under a Registration Act, I suggest the immediate formation by agreement between the architectural societies, of a board of professional control, representing every architectural society in the United Kingdom in such proportion as may be arranged.

By this means pressure could be brought to bear both on public bodies and members of the profession much more efficiently than under the present system, while it would be very difficult and highly undesirable for even the unattached architect to ignore the fiat of a body so constituted; indeed, in my opinion, one effect of the formation of such a body would be to encourage those outside to come into one or other of the Societies.

In other words, there would be unity of action and cohesion where there now exists weakness and impotency, and as, in my opinion, everything points to unity being presently secured under a Registration Act, I think we may well in the meantime lay down certain principles of practice and be prepared with a code of ethics acceptable to the various societies, with a view to general adoption now and their incorporation in an Act of Parliament in due time.

Essential Qualifications for the Practice of Architecture.

From a perusal and comparison of the various codes in use amongst architectural societies at home and abroad I have found them to be very much alike; and in regard to setting out the principles of professional practice I consider that the circular issued by the American Institute of Architects, which offers advice relating to professional practice, can hardly be improved upon in seeking to maintain a high standard of practice and conduct on the part of members of the profession as a safeguard of the important financial, technical, and æsthetic interests entrusted to them.

The profession of architecture, as the American Institute truly says, calls for men of the highest integrity, business capacity, and artistic ability. The architect is entrusted with financial undertakings in which his honesty of purpose must be above suspicion; he acts as professional adviser to his client, and his advice must be absolutely disinterested; he is charged with the exercise of judicial functions as between client and contractor, and must act with entire impartiality; he has moral responsibilities to his professional associates and subordinates; finally, he is engaged in a profession which carries with it a grave responsibility to the public. These duties and responsibilities cannot be properly discharged unless his motive, conduct, and ability are such as to command respect and confidence.

I am of the opinion that if the architectural societies will take a wider view of their responsibilities to the profession, while not neglecting their own immediate concerns as societies, and work together, by means such as I have indicated, on all matters of general interest to the profession or the public, they can even under present conditions do an enormous amount of good in the direction of maintaining a high professional standard and consequently in raising and maintaining the whole tone and standing of the profession and of the art in the estimation of the public.

No set of rules can be framed to include all the duties of the architect in his various relations to his clients, to contractors, to his professional brethren, and to the public, but the following may be enumerated as some of the main principles which should govern the conduct of members of the profession, and may serve as a guide in circumstances other than those enumerated.

Suggestions for a Code of Ethics, the Violation of any Items of which should Constitute Unprofessional Conduct.

The following items are suggested as a guide, but their enumeration should not be construed as a denial of the existence of others equally important, and just as the several items indicate offences of varying degress of gravity so the penalty for infringement would involve warning, reprimand, expulsion, or such other punishment as the board of professional control may at the time decide.

It is unprofessional for an architect—

(1) To engage directly or indirectly in any of the building trades, except as owner.

(2) To guarantee an estimate or contract by bond or otherwise.

(3) To accept any commission or substantial service from a contractor or from any interested party other than the client.

(4) To advertise.

(5) To take part in any competition the terms of which are not in harmony with the principles approved by the board of professional control.

(6) To attempt in any way except as a duly authorised competitor to secure work for which a competition is in progress.

(7) To attempt to influence either directly or indirectly the award of a competition in which he is a competitor or in which he is interested in any other capacity.

(8) To accept the commission to do the work, either personally or by partnership, for which a competition has been instituted if he has acted in an advisory capacity either in drawing up the programme or in making the award.

(9) To injure falsely or maliciously, directly or indirectly, the professional reputation, prospects, or business of a fellow-architect.

(10) To undertake a commission while the claim for compensation or damage, or both, of an architect previously employed and whose claim has been referred to arbitration, or issue has been joined at law, or unless the architect previously employed neglects to press his claim legally.

(11) To attempt to supplant a fellow architect after definite steps have been taken toward his employment.

(12) To compete knowingly with a fellow architect for employment on the basis of professional charges.

(13) To criticise in public print the professional work or conduct of another except over his own name.

(14) To deviate from the scale of charges without permission of the board of professional control.

General Observations.

There are five points in particular arising out of the proposed schedule of practice and code of ethics to which I would call attention—(*a*) The ownership of drawings; (*b*) scale of charges; (*c*) advertising; (*d*) competitions; (*e*) architectural societies; (*f*) public authorities.

In regard to (*a*), the ownership of drawings. The fact that an architect can be called upon to deliver up to a client all drawings and documents on completion of the work and payment of fees, in the absence of any express agreement to the contrary, renders it desirable in my opinion to consider the question of endeavouring to get the decision in "Gibbon *v.* Pease" reversed, and in the meantime, in works of any importance, for the architect to arrange procedure with the client previously.

In regard to (*b*), the scale of charges. The fact that the only authority and recognition which this scale has is based on custom renders it desirable, in my opinion, from this point of view to hasten an Act of Parliament under which such a scale would be legalised. On the question of the scale generally, I am of opinion that in the architectural profession payment by commission on the cost of the building is wrong in principle if not immoral, as it is exceedingly difficult to get away from the fact that the architect benefits materially in proportion to the amount spent by the client, though he may and does in the interest of his client make every endeavour to keep within the limit laid down.

The architect should not, in my opinion, be placed in a position where it may be inferred that his personal interests are likely to clash with those of his client.

Again, a minimum scale is not unlikely to be considered or to become a maximum one also.

I have no practical proposal to make at present for the redrafting of the scale as it now exists; but it has been suggested to me, why have a scale at all, why should not architects like other artists, adjust their charges in accordance with what they can command for their services?

In regard to (*c*), advertising. It all depends on the interpretation and definition of the term which, I take it, is intended to mean when applied to architects that they should not employ commercial methods of making themselves and their work known to the public—that is to say, by direct advertising."

[The other points arising out of the proposed schedule—*i.e.* (*d*), (*e*), and (*f*)—were also briefly dealt with by Mr. Butler.]

THE STATUTORY REGISTRATION OF ARCHITECTS.

The President of the Society of Architects, Mr. George E. Bond, J.P., has issued the following statement on "The Statutory Registration of Architects—The Society of Architects and the Royal Institute of British Architects: The Present Position and Future Programme of the Society and the Policy of its Council":—

"It is apparent from the communications I am constantly receiving from members of the profession that there exists a considerable amount of misunderstanding both in regard to the present position of the Society and the probable future action of its Council in reference to the above and other matters. Under these circumstances I think it desirable to make the following statement:—

As a result of negotiations between representatives of the Councils of the Royal Institute and of the Society, extending over fifteen months, certain proposals for the fusion of the Society with the Royal Institute and the promotion of a Registration Bill were agreed to, but on the scheme being submitted to a general meeting of the members of the Royal Institute on January 8 last the proposals were referred back to the Council of that body for further consideration.

The members of the Society have consequently not yet been called upon to express their opinion on the above proposals by voting; but they have severely and adversely criticised them by correspondence, more particularly with regard to the question and terms of the fusion of the two bodies. The opponents of the scheme on both sides claim that too much was to be conceded for the little to be obtained in return.

The Position of the Royal Institute.

The position of the Royal Institute is that it is pledged to Registration, and its Council have appointed a Committee to consider the matter in view of the situation created by the reference back to them of the proposals above mentioned.

The Position of the Society.

The position of the Society is exactly what was before—that is to say, it is pledged, as ways, to Registration, but not to any urse of action therein with the Royal stitute, and the Council of the Society will t initiate further steps in regard to the ion of the Society with the Royal Institute, ough they will be prepared to favourably nsider and discuss any reasonable proposition regard to the subject which may be sub-tted to them by the Council of the Royal stitute.

Registration.

n regard to Registration, a new situation has sen. The Society of Architects has been the neer in this movement for considerably over uarter of a century, and when the Council the Royal Institute adopted a Registration icy this enabled negotiations to be opened h them with a view to the promotion of a nt Bill.

n the early stages of the discussion it became parent that with regard to one of the main nts of the proposed Bill my colleagues and as representing an independent architectural ly, could not possibly agree with the view forward by the representatives of the Royal titute, and, as they were equally determined to accept ours, the question of amalgama-n was suggested to us as a way out of the iculty: for both parties recognised, as all ughtful persons must, that in the present gested state of public business in Parliament ontentious Bill would not have the least nce of reaching a Second Reading; and that her party could hope under these conditions pass a Bill through Parliament unless there unity of action.

s, however, the Council of the Society of hitects have laid down in the proposals for fusion of the two bodies the minimum ch they can recommend their members to ept, and as these proposals have been erely criticised by the members concerned, would seem unlikely that further progress be made in this direction, but there remains alternative of continuing the negotiations n regard to a joint Registration Bill; and are prepared and indeed desirous of con-ing them, hoping thereby to establish that y of action which is essential in that case uccess.

he opinion has been very freely expressed many influential members of both bodies t in order to secure the passage of a Bill ch will protect the interests of all practising nbers of the profession, and not merely se belonging to one institution, it is an ntial condition that the Society of Architects l continue its existence as a powerful pendent body.

may here state that at the time the otiations with the Royal Institute were first ned the Council of the Society had formu-d a certain course of action in regard to the oduction of the Society's Registration Bill Parliament, and the machinery which then ted is still available, and should it even-ly be found impossible to make progress any other way that machinery will be set notion. In other words, we are prepared, ecessary, to resume at any moment that re independent propaganda hitherto so easfully pursued, but which we temporarily ended in order to consider another means of ining the same end.

aving made clear the present position as veen the two bodies and the policy the Council of the Society in regard to Registration question, I would now call ntion to the fact that the work and rities of the Society in other directions being carried on exactly as before, with-reference to any matters pending between Councils of the Society and of the Royal itute.

arious schemes of the greatest importance he development of the Society and its work, h have been held in abeyance during the otiations referred to, have been resumed are being actively prosecuted. Among e may be mentioned the institution of a of ethics, the development of the students' on, and the introduction of graded examina-, involving the reorganisation of the ifying examination for membership, in nexion with which latter the Council are ously considering whether or not, at an date, admission to the Society in any shall be restricted to those who have ffied by examination.

Until further restrictions are imposed it is open to any qualified architect who can comply with the regulations to be nominated as a candidate for membership of the Society, and, on satisfying the Council of his eligibility and qualifications by production of evidence of the standard required in lieu of other examination, to be proposed for election.

Architects who are in sympathy with the proposals for Registration will appreciate the fact that the Society of Architects is the only architectural body which has made Registration one of its chief aims, and which is pledged to secure that end by one means or another; and it is on this account particularly that the Society has a claim to the support of all qualified architects, on whose behalf it has consistently and persistently advocated and upheld the principle of Registration for so many years, in the face very frequently of bitter opposition and misrepresentation.

The Society is a powerful and strongly established institution, with a total membership of nearly 1,200. It has its own premises and every facility and means for extending the scope of its operations and for the ultimate attainment of its principal object. It is incumbent on those who are with us in principle to be also with us in person, and I venture to express the hope that every eligible architect who possesses the necessary qualifications and is in sympathy with the aims of the Society will consider it his duty, apart from any personal advantages to be derived, to give to the Society that material and practical support which can only be evinced by joining its ranks and thus still further strengthening and consolidating its position and influence."

ARCHITECTURAL SOCIETIES.

The Royal Institute of the Architects of Ireland.

An ordinary Council meeting of this Institute was held on Monday last week at the Institute Rooms, No. 31, South Frederick-street, Dublin.

The Vice-President, Mr. R. Caulfeild Orpen, B.A., was in the chair. There were also present:—Messrs. C. H. Ashworth, P. L. Dickinson, L. O'Callaghan, J. H. Webb, G. C. Ashlin, W. Kaye-Parry, H. Allberry, A. G. C. Millar, G. P. Sheridan, and C. A. Owen, Hon. Secretary.

A considerable amount of correspondence was dealt with. The annual dinner was fixed for May 7, when his Excellency the Lord-Lieutenant of Ireland has promised to be present. The question of the best steps to be taken in order to have an architect assessor appointed to sit with the judge in building cases was referred to the Professional Practice Committee for report.

ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

At a recent meeting of the Institution of Civil Engineers three papers were read on Glasgow Main Drainage Works, the following being abstracts:—

(1) "The Main Drainage of Glasgow," by Mr. A. B. McDonald and Mr. G. M. Taylor, MM.Inst.C.E. This paper commences with a retrospect of the many past endeavours to free the River Clyde from the pollution of the Glasgow sewage, going as far back as the year 1605. At this time the river was quite tideless and fordable in many places at Glasgow. Trade was insignificant, as seaborne traffic could reach the city only after transportage into small boats at Dumbarton. In 1662 the Town Council ordered a small quay to be built at the Broomielaw, and this was the commencement of the great transformation of the Clyde into one of busiest waterways in the United Kingdom.

In 1859, the late Mr. J. F. La Trobe Bateman, Past-President Inst.C.E., and the late Professor Anderson reported on the subject. Later reports were made by the late Sir Joseph Bazalgette, Past-President Inst.C.E., and the late Sir John Hawkshaw, Past-President Inst.C.E., and in 1878 Mr. Bateman again reported, but nothing was done, and the condition of the river became worse and worse.

Soon after this a Bill was deposited in Parliament for the construction of the Glasgow underground railway, which was projected in such a way as to dislocate the entire sewage system then in existence. The Corporation strongly opposed this measure, but eventually arrived at an agreement on obtaining from the promoters an undertaking that they would bear the expenses of reconstructing the sewers to the approval of the Council; and in conference with Sir Joseph Bazalgette a system was designed whereby the sewage of the north-eastern area was conveyed to Dalmarnock. The Corporation then engaged the late Mr. G. V. Alsing to design works for the purification of the sewage at Dalmarnock. The general arrangement of these works is at present as follows.

The sewage, amounting to an average daily flow of 18½ million gallons, is passed through vertical screens, and thence into two catchpits. The solids are removed from these pits by mechanical means. The sewage then flows into the pump-well, whence it is lifted by means of five centrifugal pumps into a mixing-pit, where the chemicals are added. The mixture is passed into precipitation-tanks, where the solids are allowed to settle. The tank-effluent passes direct into the river. The sludge from the precipitation-tanks is pumped into three storage-tanks, where it settles until about 50 per cent. of the top liquid can be drawn off. High-pressure rams then raise the sludge to the presses. About 247,000 tons of wet sludge are dealt with per annum.

The Dalmarnock works were regarded by the Corporation in the light of an experiment, and the results proved so satisfactory that it was resolved in 1895 to proceed on similar lines with works for dealing with the remainder of the City. Works were constructed at Dalmuir to deal with the north western part of the City, and at Shieldhall for the area lying south of the Clyde.

The process of purification at Dalmuir may be briefly summarised as follows:—The sewage, amounting to an average daily flow of thirty-six million gallons, passes through a screen chamber and thence into catchpits, where the heavier solids settle and are removed by means of a dredger. The chemicals are added to the catchpit, and the sewage then flows into one or other of eight precipitation-tanks, having a combined capacity of twelve million gallons. The sludge is pumped into an elevated tank, whence it flows by gravitation into the hold of the sludge-steamer. The steamer carries about 1,200 tons of sludge in closed tanks a distance of 40 miles from Dalmuir, and last year it dealt with over 300,000 tons of sludge.

The works designed for the treatment of the sewage of the southern district at Shieldhall deal with an average daily flow of twenty-three million gallons. They are to a large extent a repetition of those at Dalmuir. High and low level intercepting sewers have been constructed. The low-level sewage from the eastern part of this area is raised into the high-level sewers at the Kinning Park pumping-station, and the low-level sewage from the western half is raised to the works at Shieldhall.

Great difficulties were encountered in the construction of the works in the southern area. The sewers in many places were found to overlie coal workings of unrecorded date, necessitating a large amount of special construction in cast-iron segments. The erection of the Kinning Park pumping-station also proved a matter of great difficulty owing to the insecure nature of the substrata, which consisted mainly of silt, and at the purification works there was an abnormal amount of subsoil-water which rendered exceedingly difficult the construction of the deeper parts of the machinery buildings. These difficulties were overcome, and the whole of the works have been in successful operation since May, 1910.

The precipitation process adopted at all three works completely removes the suspended solids from the sewage, and effects a high degree of purification upon the liquid. In consequence, the condition of the Clyde has improved so much that in place of being a dead river it has returned to a live and satisfactory condition.

(2) "The Construction of the Glasgow Main-Drainage Works," by Mr. W. C. Easton, B.Sc., M.Inst.C.E. The Glasgow

Main-Drainage Works, as described in the previous paper, consist of three schemes. The two larger of these cost over two millions sterling, and the present paper deals with their construction, which covered the period from 1899 till 1910. Owing to the fact that, apart from sundry differences, the two schemes are similar, and that the construction of the second was not put in hand until an interval had elapsed after the completion of the first, there was naturally a great opportunity for developing the special ideas gained from the experience of the first in the construction of the second. The author consequently deals largely with a comparison between the methods employed.

Four leading developments in ideas obtained from the experience on the construction of the first were applied on the second, namely :—

(*a*) To standardise designs;

(*b*) To use tunnel in preference to open cutting, particularly if it involved the use of sheet-piling;

(*c*) To adopt longer drives and smaller sizes for tunnel;

(*d*) To take full advantage of the fact that the Glasgow Main Drainage staff was capable of executing the more difficult work without the aid of contractors

The more interesting portions of the works described are :—

The difficulties and expense incurred through the presence of old mineral workings. The most expensive case was where the cost of a 7-ft. sewer amounted to nearly 300*l.* per lineal yard.

The construction of the rising main, which affected its design considerably. Incidentally this work further illustrates the development of ideas already referred to.

An experiment in tunnelling in concrete segments, lined with brickwork.

The Kinning Park pumping-station provided the most difficult construction work on the schemes. This station is founded rather below the middle of a 44-ft. bed of running silt, closely surrounded by buildings and streets carrying tramways. The design—apart from the mechanical equipment—was entirely controlled by construction, and the whole station was a work which, from the difficulties of the site, gave the Glasgow Committee a great deal of anxiety. The five stages employed in the construction of the sub-structures are described; great care was taken in detail, such as the keeping of very close piling diaries. In an Appendix the measurement of the main work is given, priced on its actual cost to the Corporation, and amounting to about 37,000*l.*

Appendixes to the paper give an abstract of unusually thorough analyses of cost, made by the author on the instructions of the Town Clerk for Parliamentary purposes. The results show considerable economy effected by the developments in ideas applicable to the special conditions obtained from the experience of the western works. This economy was effected on the prices for the more difficult work, particularly where iron tunnel and air-pressure were used.

The opinion is expressed that the main factor in this result was the manner in which Glasgow used its Main Drainage staff in executing work without contractors. The author considers that this factor operated chiefly in a moral way, in making the staff leaders instead of directors. As the author had on these works over ten years' concurrent experience in the execution of work both with and without contractors, the paper concludes with some remarks on the general question of public bodies carrying out such work without contractors. The opinion is given that the factor of "youth" was one of the essentials.

Two deliberate, although somewhat paradoxical, conclusions are then stated on the general question, namely :—

(*a*) That, generally speaking, an attempt by a public body to create a department and carry out works without contractors is not likely to be attended with success.

(*b*) Under special circumstances such as those which ruled on the construction of the western and southern schemes of the Glasgow main-drainage works, the holding of a staff fit and ready at once to undertake, when called upon, the most difficult sections is an ideal method.

(3) "Glasgow Main Drainage: the Mechanical Equipment of the Western Works and of Kinning Park Pumping-Station," by Mr. D. H. Morton, M.Inst.C.E. This paper deals chiefly with the following items of the works :—The Partick pumping-station of the western works; the mechanical equipment of the Dalmuir purification works; the pumping-machinery for Clydebank drainage; and the overhead sludge tank at Dalmuir. The author also describes the mechanical equipment of the Kinning Park pumping-station.

At the ordinary meeting on the 2nd inst. new members and Associate members were elected. The elected members are Mr. J. M. Alexander, London-wall, E.C., and Mr. A. Don Swan, Montreal. The elected Associate members number seventy.

GENERAL NEWS.

The Royal Institute of British Architects.

The discussion of the papers on "The Newer Responsibilities of Architects," adjourned from the meeting of December 18 last, will be resumed at a meeting to be held on Monday, April 15, and a paper entitled "The R.I.B.A. Conditions of Contract: Some Points for Revision," will be read by Mr. A. Saxon Snell.

Art Union of London.

The Art Union of London, 112, Strand, publishes as its premium plate for 1912 an effective reproduction in colours, 23⅜ in. by 15⅜ in., after "Timber Haulers" by the late C. W. Furse, A.R.A. Subscribers of one guinea are entitled to a copy of the facsimile, with the chance of a prize at the Annual Drawing on April 30.

Old Sergeant's Inn.

The structure which has now been completed on the site of Old Sergeant's Inn will be known as Old Sergeant's-inn, and has been erected for the Law Union and Rock Insurance Company, who have this week removed their chief offices into the new building.

University College School of Architecture.

In the Annual Report of the University College Committee reference is made to developments in connexion with the School of Architecture. Better accommodation has been needed for many years, and the Senate, with financial help which fortunately came from an anonymous donor, were able to take up a scheme for the combination of the Schools of Architecture of University and King's Colleges. Professor Simpson is the architect of the new building. Mr. and Mrs. Baily's] gift of 1,000*l.* for the rearrangement and decoration of the south cloisters and cloak-rooms is noteworthy. During the last session certificates in architecture were awarded, and Dr. J. J. Burnet was appointed Architect-Visitor to the class of Advanced Academic Design.

The Royal Sanitary Institute.

The York Congress and Exhibition, 1912, will be held from July 29 to August 3. The lecture to the Congress will be by Professor Karl Pearson, M.A., LL.B., F.R.S., on "Eugenics and Public Health," and the popular lecture will be by Professor Henry R. Kenwood, M.B., D.P.H., F.R.S.E., on "The Open Window." The President of the engineering and architecture section is Mr. J. Walker Smith, M.Inst.C.E., Chief Engineering Inspector, Local Government Board for Scotland; the Recording Secretary, Mr. A. Saxon Snell, F.R.I.B.A., Southampton-buildings, Chancery-lane, W.C.; and the Local Secretary, Mr. H. E. Henderson, Lic.R.I.B.A., York. The set subject for discussion is entitled "Modification of the Model Building By-laws from the Rural Point of View," to be opened by Mr. Halsey Ricardo, F.R.I.B.A. (Rural Housing and Sanitation Association). A Conference of engineers and surveyors to county and other sanitary authorities will be presided over by Mr. A. D. Greatorex, M.Inst.C.E., Borough Engineer and Surveyor, West Bromwich, the Recording Secretary being Mr. J. S. Brodie, M.Inst.C.E., Borough Engineer, Blackpool, and the Local Secretaries: Mr. H. Smith, Assoc.M.Inst.C.E., Borough Surveyor, Scarborough, and Mr. C. Triffit, Assistant City Surveyor, York. Subjects to be discussed are :—"Housing and Town Planning Progress," to be opened by Mr. H. Gilbert Whyatt, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, Grimsby; and "Sewage Disposal in Rural Districts," to be opened Mr. Ascough Rodwell, Surveyor, Skip Rural District Council.

Sewage Disposal, Llanwrst.

Mr. P. M. Crosthwaite, M.Inst.C.E., a Local Government Board Inquiry at L rwst recently into an application by Urban District Council to borrow 5,000*l.* purposes of sewerage and sewage dispo and also for the compulsory acquirement land for sewage disposal works. Harry W. Taylor, Assoc.M.Inst.C (Messrs. Taylor & Wallin), Newcastle-u Tyne and Birmingham, explained the posed works at the inquiry.

COMPETITION NEWS.

Port of London Offices.

In response to the competition annou in November last, inviting the submissio preliminary sketch designs for new H Offices for the Authority, 170 designs v received. The Authority, on the advice their assessor, Sir Aston Webb, C.B., R have selected the six designs sent in by following architects :—

Mr. Robert Atkinson, A.R.I.B.A., Mes J. A. Bowden & T. Wallis, Mr. Ed Cooper, F.R.I.B.A., Messrs. Lanchester Rickards, FF.R.I.B.A., Mr. J. Regi Truelove, Mr. Ernest W. Wray.

The authors of these designs will be inv to take part in the final competition, at honorarium of 200 guineas each. Authority do not propose to exercise the they reserved to themselves of invi designs from architects other than those took part in the preliminary competition.

Federal Capital City, Australia.

The names of the jury appointed to adjudi on the designs sent in for this competition given in a "Note" on p. 416.

The Weir Hospital, Balham.

The trustees of the Weir Charity, entru with the building of a hospital for the be of the inhabitants of Streatham and neighb hood, have selected from the designs submi in competition that of Mr. R. J. Thom F.R.I.B.A., of Wimbledon. The scheme been approved by the Charity Commissio and the work is to be proceeded with forthw A perspective view appears on p. 415.

Miners' Federation Hall, Bolton.

The first premiated design in this c petition is by Messrs. Bradshaw, Gass Hope, 19, Silverwell-street, Bolton. second premiated design is by Messrs. Sy & Evans, Salisbury-chambers, 7, Cha walks, Manchester. The third premi design is by Messrs. Thos. E. Smith & S Central-chambers, Fold-street, Bolton. designs are not to be exhibited. assessor was Mr. Jonathan Simp F.R.I.B.A.

FOREIGN AND COLONIAL.

Building in the Netherlands.

The following information is from the re by H.M. Consul at Amsterdam (Mr. W Churchill) on the trade of that district in which will shortly be issued :—

The building trade was active during and is expected to continue so during next two or three years; in fact there never before been so much building goin in Amsterdam at one time. A new S Exchange, large shops, offices, and reside buildings are in course of erection, and t is a project to build a new royal palace. activity will produce a demand for consi able quantities of building materials, furnit sanitary engineering, heating, and illumi ing appliances, etc.

Library Building and Fittings, Roumani

The *Nachrichten für Handel und Indu* (Berlin) of March 15 announces, on authority of the German Consul at Bucha that a building is to be erected at that p for a large public library. It will con book space for one million volumes, and acc modation for one hundred ordinary rea and thirty students. It is desired that building should be erected as soon as possi consequently, adds the Consul, no time wil lost in inviting tenders. The contract include heating, lighting, ventilation arra ments, etc.

DITORIAL SUMMARY.

ne leading article, "Patriotism in Architec-" is suggested by the discussion at the last ting of the Architectural Association, when ers on the subject were read by Mr. C. A. sey and Mr. Arthur Keen.

MEETINGS.

FRIDAY, APRIL 12.

Institution of Civil Engineers.—Students' meeting. H. G. Hoskings on "Exminster Sewage Disposal s." 8 p.m.

SATURDAY, APRIL 13.

nburgh Architectural Association.—Visits to (1) rood Palace and Chapel; (2) Thistle Chapel.

MONDAY, APRIL 15.

Royal Institute of British Architects.—Resumed ssion on "The Newer Responsibilities of Archi-" and paper by Mr. A. Saxon Snell on "The R.I.B.A. itions of Contract: Some Points for Revision."

Architectural Association.—Mr. Lawrence Weaver, ., on "Some Scottish Houses of the Renaissance." .m.

Incorporated Clerks of Works' Association enters' Hall, London-wall). — The thirteenth l meeting. 7 p.m.

TUESDAY, APRIL 16.

Institution of Civil Engineers.—The Hon. Sir is J. E. Sprung, M.Inst.C.E., on "The Re-lling and Equipment of Madras Harbour," and Hugh Henry Gordon Mitchell, M.Inst.C.E., on Alteration in the Form of Madras Harbour."

Illuminating Engineering Society (at the Royal y of Arts, Adelphi, W.C.).—"The Lighting of Private s by Gas and Electricity," by Mr. W. H. Y. er and Mr. W. R. Rowlings. 8 p.m.

WEDNESDAY, APRIL 17.

Institution of Civil Engineers. - Students' visit e Constructional Steelworks of Messrs. Joseph wood & Co., Napier-yard, Millwall.

Royal Archæological Institute (at Burlington House).—Mr. Talfourd Ely, M.A., D.Litt., F.S.A., on "Excavations near West Marden and in Hayling Island," and Mr. Phillip Nelson, M.D., Ch.B., F.S.A., on "The XVth-Century Painted Glass in the Church of St. Michael, Ashton-under-Lyne." 4.30 p.m.

Edinburgh Architectural Association. 8 p.m.

Junior Institution of Engineers (at the Institution of Electrical Engineers, Victoria-embankment).—Paper on "The Lay-out and Erection of Electric Power Plant," by Mr. E. Kilburn Scott, M.Inst.E.E. 8 p.m.

Royal Society of Arts.—Mr. John Henry Coste, F.I.C., F.C.S., on "Municipal Chemistry." 8 p.m.

THURSDAY, APRIL 18

The Institution of Mechanical Engineers.—Anniversary dinner, Hotel Cecil.

Society of Antiquaries. 8 p.m.

Institution of Electrical Engineers. — Adjourned discussion on the following subject: "The Causes Preventing the More General Use of Electricity for Domestic Purposes." 8 p.m.

FRIDAY, APRIL 19.

The Institution of Mechanical Engineers.—Paper by Dr. Walter Rosenhain and Mr. S. L. Archbutt on "Tenth Report to the Alloys Research Committee: On the Alloys of Aluminium and Zinc." 8 p.m.

MUNICIPAL BUILDINGS EXTENSION, GLASGOW.

For some time past the question of the designing of the proposed extension to Glasgow Municipal Buildings has been before the Corporation and the public, and we are glad to note that the advocates of "Municipal Architecture" have received a check. The Council have, by the small majority of three votes, refused the recommendation of the Sub-Committee, proposing to place the work in the hands of the City Engineer, and decided to invite competitive designs for the new buildings. This decision has given great satisfaction to architects locally, as for some time past the policy of the Corporation has been to place large works in the hands of officials. These include the reconstruction of the Tontine Buildings, destroyed by fire, and the McLellan Art Galleries. Much credit is due to the local Institute of Architects for the vigorous stand it has taken in the matter, and it is largely owing to their efforts that the present decision has been obtained. Mr. A. N. Paterson, A.R.S.A., along with a deputation of the Council of the Institute, waited on the Corporation on the 21st ult. and made a protest against the policy of employing officials in carrying out large architectural works.

The following among other points were made by Mr. Paterson:—

"(1) All experience of departmental work of this nature shows the cost in relation to the value of work to be greater, where everything is accounted for, than where done by outside men. Figures are not available to us for the city, but in the Scottish Board of Works Office it has been shown to be equal to 8 per cent., and in all the English instances investigated considerably more.

(2) The lack of personal responsibility on the part of the designer when an official tends to indulgence, on his part, in extravagance in design and finish, and this is accentuated when his experience has been confined to that of a public office where the personal interest is not closely involved in controlling expenditure. On the other hand, an independent architect, being freed from inside influences and accustomed to be held personally responsible for ultimate cost, is in a much better position to look after his client's interests in that respect.

(3) The Corporation, with an independent architect employed, and a competent official to advise it, is not deprived of the value of expert criticism on the design of buildings to be erected for it as it is when the official is also the designer."

In conclusion, it was pointed out that the City Engineer, while fully qualified for departmental duties, was not a trained architect, and was therefore not in a position to adequately supervise the work, which was therefore bound to fall more or less into the hands of his architectural assistants who, no matter what their qualifications were, were not personally responsible for it.

CORRESPONDENCE.

Competition Reform.

Sir,—Having had the honour of addressing you from time to time on the subject of the unnecessary expense to architects in competition work, I venture to again call attention to the subject and to make a suggestion.

I greatly regret that Sir Aston Webb could not grant the omission of the perspective view in the Port of London Offices Competition, but thank him for limiting expenditure in other directions.

Seeing that some 600*l.* was probably expended in the views alluded to, I suggest that in future if an assessor desires to see the effect of a design in perspective he should be empowered to call in assistance in respect of such designs as he considers to be in the running—the expense of so doing falling upon those who initiate the competition.

Surely a rich Corporation like the Port of London Authority can better stand the small cost of such proposal than the larger aggregate expended by the 164 unsuccessful competitors.

L.

INTERCOMMUNICATION COLUMN.

Damp Houses.

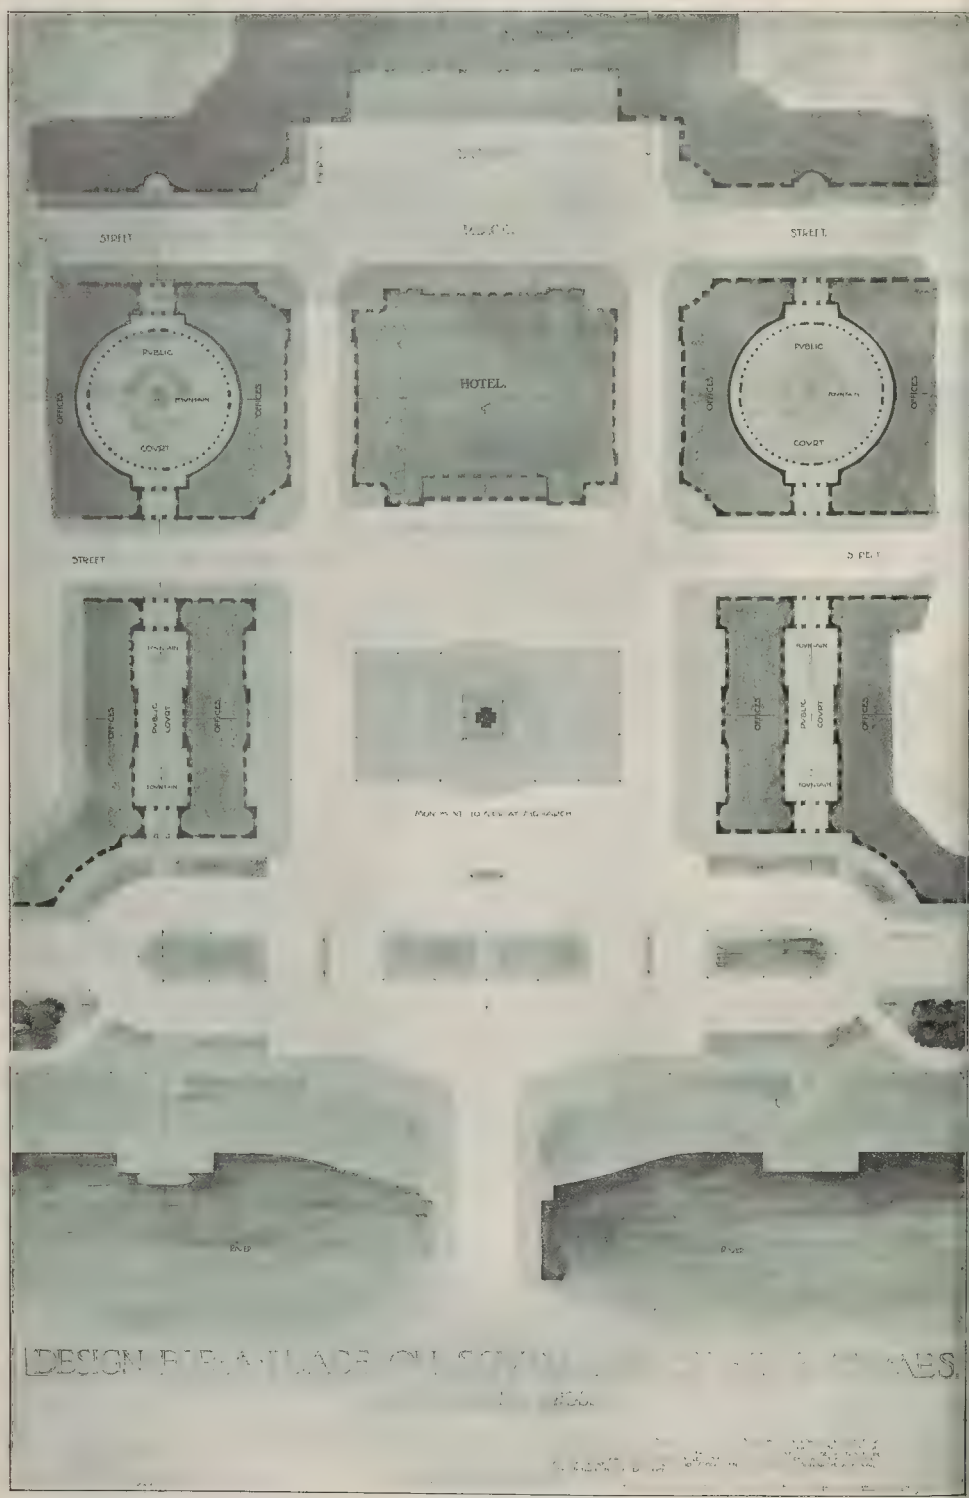
Sir,—Can you tell me of some remedy for a damp house? The dampness shows very markedly on one outer wall, and the tenants complain of dampness generally. If you can tell me of some inexpensive means I shall be very much obliged. Ab Extra.

ILLUSTRATIONS.

Royal Academy Schools, 1911.

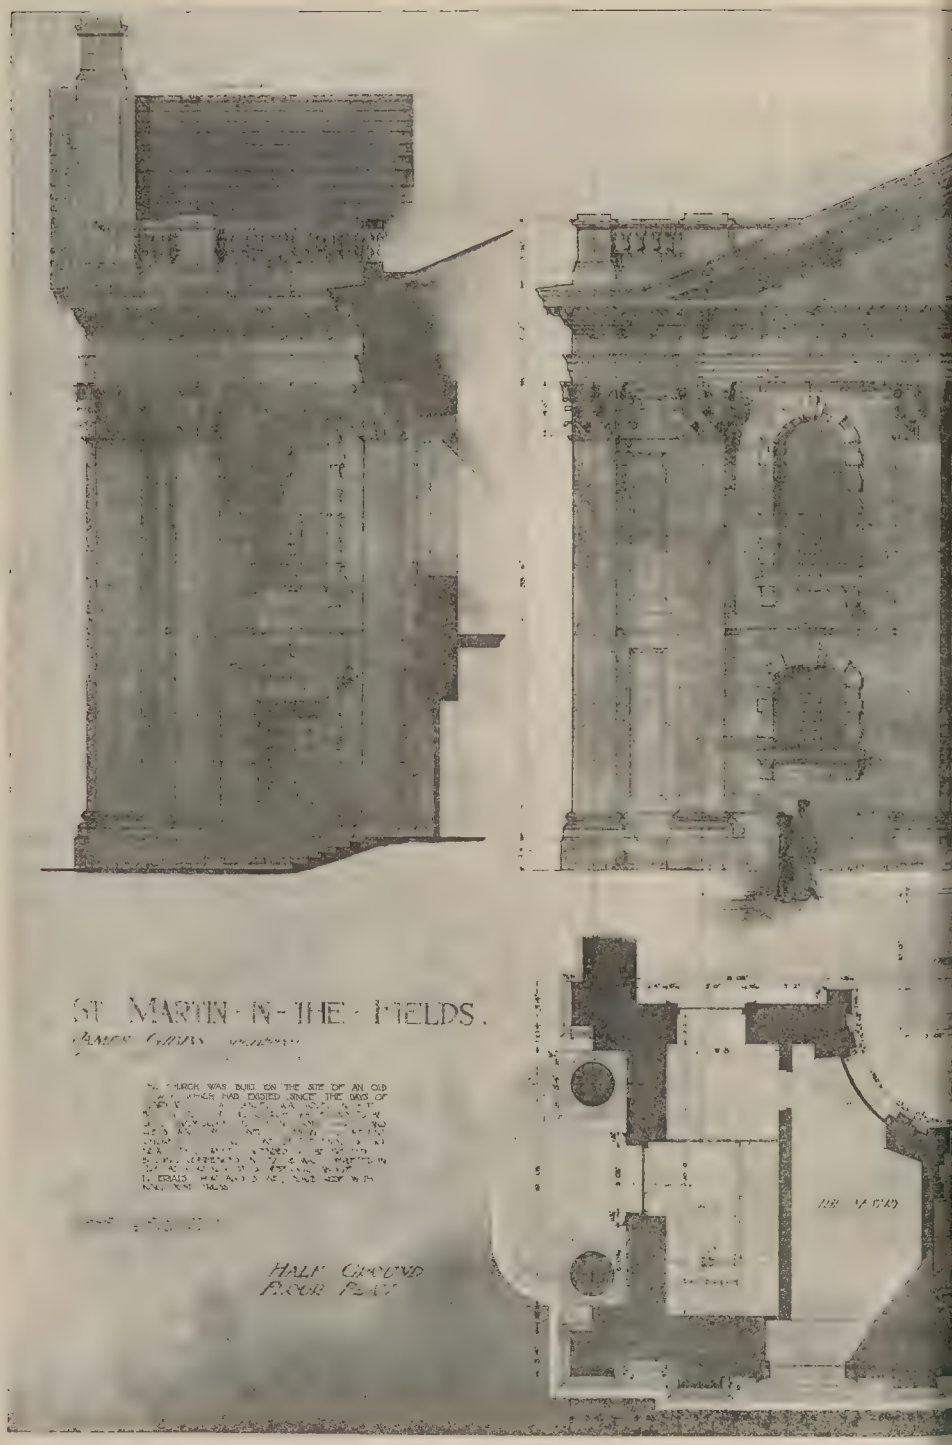
Our plates this week illustrate some of the drawings sent in for the minor prizes offered by the Royal Academy. Mr. W. H. Gummer's "Design for a Place on the South Side of the River Thames," though not successful in the competition possesses many features of interest.

FIFTY YEARS AGO.



From the *Builder* of April 12, 1862.

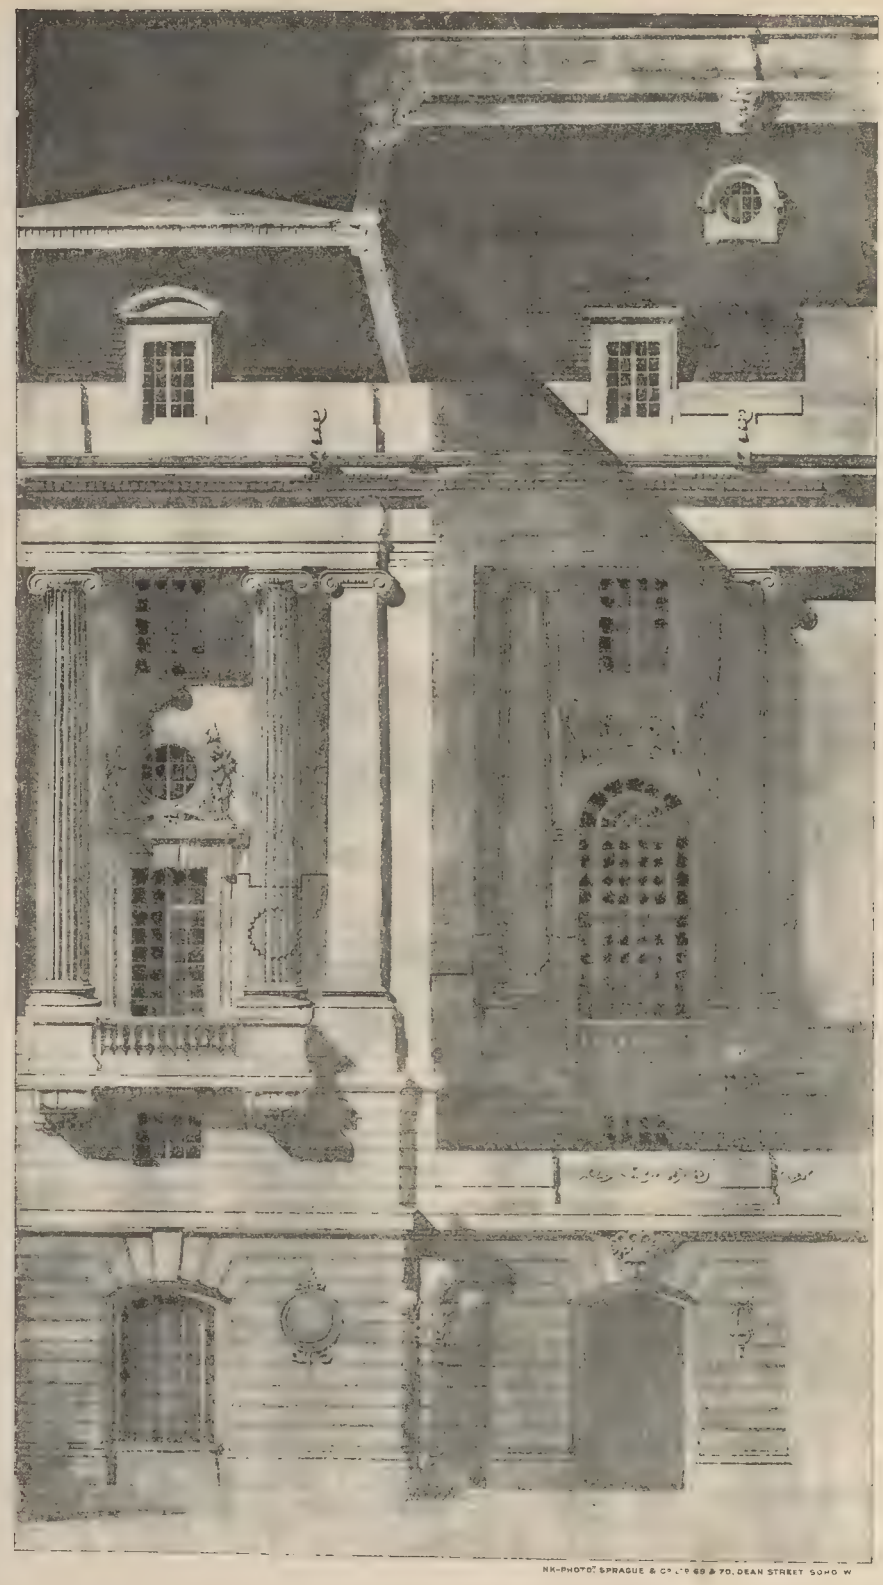
"London Monumental."



In our number of March 22 we gave utterance to our thoughts touching the laying out the Green Park in a way, as we believed, worthy of our world-renowned capital, the chief city of the largest empire in the world, upon which, it is said, the "sun never sets," and yet, for all this might and power, there is scarcely a small German or Italian capital that does not excel us in our street architecture. Ours is detestable, some late examples excepted. Look at our miles of ugly brick houses begrimed with smoke, without one feature of architecture the weary eye can look satisfactorily on; it is literally all "desert from Dan to Beersheba." We have heard that foreigners, after travelling some hundreds of miles, in other instances some thousands, to visit the modern Babylon, which, alas, it only resembles in its size and its sins, have asked to be shown "the *grande place*" and Trafalgar-square has been exhibited to them. Let anyone place himself on those steps leading to the two or three rooms which we bombastically call our National Gallery, and look southwards at the higgledy-piggledy wretched-looking habitations that alone meet the eye from Charing Cross downwards, unrelieved except by a couple of drinking fountains, to which there have never been caps, and a Corinthian pillar erected to the memory of Nelson some twenty-five years ago and never yet finished.

THE WORK OF MR. ARNOLD MITCHELL.

In our issue for March 29 we gave some illustrations of metalwork, wood, and stone carving, etc., and we are asked to state that the work was carried out by Messrs. H. H. Martyn & Co., Ltd., sculptors and architectural decorators, of Cheltenham.



R.A. Schools, 1911 : Detail of an Architectural Design.

MONTHLY REVIEW · *of* · CONSTRUCTION.

SOME ANCIENT BRICK ARCHES AND A NEW ARCH.

By H. Slicer.

THE ancient Egyptians made use of the arch in their buildings, perhaps not to any great extent, but the examples to us show that they were aware of some the possibilities as an adjunct to construction. Several of their arches are built upon "corbel" principle by simply projecting ry upper brick beyond the end of the in the course beneath *ad lib.* until the ning was spanned by the projecting bricks m both sides meeting at the centre of the ning, a method employed later by the eks (as in the Treasury of Atreus) and zantians.

Assyrian Drain. BC.772.

n the Temple at Abydos, commenced by I. and completed by Ramessu II. (1330), are seven vaulted chambers built side side. The vaults are composed of tile- bricks, built in horizontal courses upon corbel principle, thus having horizontal ts. This type of vault gives no lateral ıst, being more stable than the ordinary ssoired arch, but it is a form unsuitable large spans, the rise being high. It is able for pointed arches similar to the asury of Atreus, but does not readily lend f to semicircular arches.

he bricks of the vaults of the great erooms of the Ramesseum behind the ple, built by Ramessu II. (1330 B.C.) at u-Simbel, Ipsamboul, are 14 in. long by wide and 2½ in. thick, laid four courses k, and at intervals extra rings are added strength. Mariette found a brick arch bydos of the period of the sixth dynasty ng brick voussoirs with a limestone stone, the joints being "galetted" in tar—*i.e.*, having joints with small stones ded therein. In the valley of El-assanif, Thebes, a brick semicircular arch ng nine rings was discovered in the wall surrounding the tombs. This dates back to about 700 B.C.

All forms of arches were used, though the favourite type seems to have been the elliptical. Even the inverted arch was employed to more equally distribute the load along the footings in the way it is employed to-day. The reason for the favour shown to the elliptical arch seems to have been due to constructional reasons. The bricks, being composed of mud, were more easily crushed than burnt brick or stone, and any semicircular arch built of such bricks would fail first by crushing at the crown. To overcome this a sharper curve was necessary at this portion of the arch, hence arose the general adoption of the parabolic form of arch, as in the Ramesseum vaults. As a protection against the weather the top of the vault was covered with a deep layer of sand and gravel, which quickly absorbed the rain like a sponge.

Although thin arches were built by the Egyptians similarly to the voussoir method of to-day, they preferred to use their thin bricks, dispensing with centering—as they do to this day—adopting an ingenious method of erection, depending during erection upon the adhesive power of their mortar and its quick-setting properties. The end walls were first erected, and upon these the outline of the arch was marked. They then built the lower courses horizontal to as great a height as practicable, thus lessening the span, and the remaining arch bricks were laid upon these on end, the first ring being formed by building one course flat against the wall. The second course was built up against this, the whole process depending upon the adhesive properties of the mortar. Thus was the vault built. In some cases the end walls were "skew-backed" along the arch line, and the tile-like bricks laid thereon to form the arch, each course thus supporting the following one as laid, the adhesion of the mortar not being a necessary factor to be relied upon. The bricks were thus placed at an angle to a vertical plane passing across the span. This arch is much stronger than the first, gaining also extra support from the end walls. The successive layers were often built at opposite slopes, thus causing the rings to cross one another. This is somewhat similar to the construction of Fig. 1, which shows an Assyrian drain (taken from a drawing by M. Place). The arch does not lie in a vertical plane, but at an angle to the vertical. M. Place shows these bricks specially shaped and not rectangular, but Sir H. Layard says that the drain he discovered in the North-West Palace at Nimroud had only common bricks for its voussoirs, and that they were not specially shaped for vaulting; the space at the top being open, was filled in with ordinary bricks. The reader will notice that each ring (Fig. 1) forms a pointed arch lying in an inclined plane. It would therefore be practically impossible to build one ring alone, for it would not stand unsupported; and as for loading it, that would be out of the question. There are obvious advantages, however, attached to this inclining of the arch bricks, and if the arch could be made stable (I refer to every arch ring separately), these could be utilised. In Figs. 2 to 4 are shown such a type of arch which I have devised, the bricks being inclined to the vertical, but the whole arch falling within two vertical planes.

The bricks are really portions of the surface of a half-cone, as will be seen from Fig. 2, the intrados as it were of each ring being of varying radius instead of constant, as in the case of ordinary arches. The whole arch (Fig. 4) being built of several rings, has an intrados of constant radius, as is also that of the extrados. That each ring is staple will be seen from a consideration of any parallel slice in the ring, for such a slice fulfils all the conditions of an arch.

Such an arch is capable of a variety of treatments, and there is no reason why as an architectural feature it should not also be successful. The lower edges of the bricks could be moulded, or various coloured bricks could be judiciously employed.

Ordinary tiles could be used; being thin, there would be only a slight increase in the opening of the joints at the extrados, but to produce the best work the bricks would have to be slightly curved and narrower at one end than the other, as shown in the projection (Fig. 2).

REINFORCED CONCRETE IN GREAT BRITAIN.—V.

BY W. NOBLE TWELVETREES.

(Continued from page 377.)

Indented Bar System.—In all designs prepared by the Indented Bar and Concrete Engineering Company, Ltd., of Westminster, the patent indented bar is employed, all projects designed by the company being based upon approved principles of architectural and engineering practice.

Indented bars are used simply because the company consider them to be better than ordinary round bars for theoretical and practical reasons, but their application in no way influences the general character of designs.

Consequently it will be seen that there is no indentel bar "system," using the term in a strict sense.

Indented bars of the types employed by the British company were patented in 1904 by Mr. A. L. Johnson, of St. Louis, U.S.A., and also by Mr. Lindau, under the title of Corrugated Bars, which have been largely employed in America by the Expanded Metal and Corrugated Bar Company, of St. Louis.

In his British patent Mr. Johnson claims that in his improved bar "the projections are so arranged and proportioned as to contribute to the tensile strength," this being accomplished "by arranging the projections and spaces so that any transverse section will pass through at least as many projections as spaces. The projections preferably have flat faces and bevelled edges, the latter inclined at an angle not less than the angle of friction for concrete on iron or steel, the object being to prevent splitting of the concrete by the projections of the bar. The patent covers corrugated bars of any suitable cross-section, but as made in this country the bars are either of square or circular section, as illustrated in Figs. 1 and 2.

The main advantage claimed for the indented bar is the mechanical bond it provides between the concrete and the steel, whatever be the quality of the steel of which the bar is rolled

Although prepared to produce their bars in mild or any other variety of steel, t company state that the result of the experience is that a medium steel having yield point of about 50,000 lb. per square inc with an extension of not less than 15 per cen in a length of 8 in., combines all t advantages of a higher yield point with t ductility and reliability of the mildest steel.

The mechanical bond is stated to be special advantage :—

(1) In structures exposed to shock, vibr tion, or moisture.

(2) For web reinforcement in beams whe the links or stirrups are necessarily short.

(3) For use in concrete of low adhesi power.

(4) In cases where high tensile stresses a developed in the steel.

(5) In members where tension cracks ma be developed in the concrete, the effect of t mechanical bond being to distribute t cracks and to prevent their concentration one or two points.

Although, as previously stated, the compar do not tie themselves to any one arrangeme of the bars in reinforced concrete construcio the following are forms of design which ha been largely adopted by them in Gre Britain.

In beams the main tension and compressi bars are applied in the customary manne some of the tension bars being bent up fro different points in the length of the bea towards the supports so as to provide f resistance to shear and diagonal tension the web, while in the case of continuo beams the bars are of length sufficient enable them to be continued near the upp surface of the concrete across the support thus providing the requisite resistance stresses due to negative bending moment Slabs between and working with beams a usually reinforced by two series of bars right angles to one another, the bars bei bent up so as to pass through the upp portion of the supporting beams.

Columns, which may be of any desir cross-sectional shape, are reinforced by fo or more longitudinal bars, braced lateral by ties of soft iron wire spaced at sho distances apart.

For the reinforcement of curtain walls a interior partitions in buildings indented ba are applied horizontally and vertically to fo a network near each face of the concrete.

The "Dentile" floor is a new syste recently introduced by the Indented Bar a Concrete Engineering Company, combini the advantages of reinforced concrete a hollow tile construction. This floor is ma in three styles for various conditions :—

(1) Mitre tiles, with two-way reinforcemen

(2) Bridge tiles, with one-way reinforcemen

(3) Bridge and L-shaped tiles, with tw way reinforcement.

Fig. 3 illustrates the mitre tile floor, whe each unit consists of four triangular sectio fitting together to form a closed hollow bloc The arrangement permits the slab reinforc ment to be placed in two directions, and should be noted that the lip of each tile a as a spacing piece, ensuring uniformity in t width of concrete between the tiles.

Fig. 4 shows the application of bridge tile arranged in parallel rows separated by stri of reinforced concrete constituting a series beams. This type of floor can only reinforced in one direction.

Fig. 5 illustrates a modification of t bridge tile floor, formed by the insertion L-shaped tiles by which the rows of brid tiles are broken so as to permit the introdu tion of transverse strips of reinforced concre thus making the construction of equal streng in either direction.

The Dentile flooring can be constructed spans of 30 ft. by 30 ft. or more withe projecting beams, and it is stated that a reliable contractor can carry out the we without previous experience, as full details the reinforced concrete and tiles are suppli by the company, together with the prop quantities of tiles and reinforcing bars.

The specialities of the Indented Bar a Concrete Engineering Company are suppli freely to all purchasers at fixed rates, with without designs for their application. Desig for structures in reinforced concrete, or the Dentile flooring, are prepared for arc tects free of charge, providing it is understo that the specialities of the company will specified. The company accept full respon bility for all designs prepared by th engineering department.

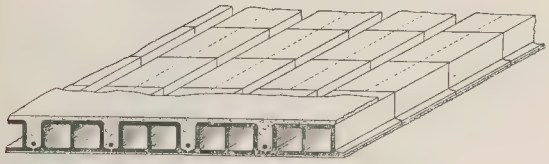

Fig. 4. Dentile Floor (Bridge Tile Type).

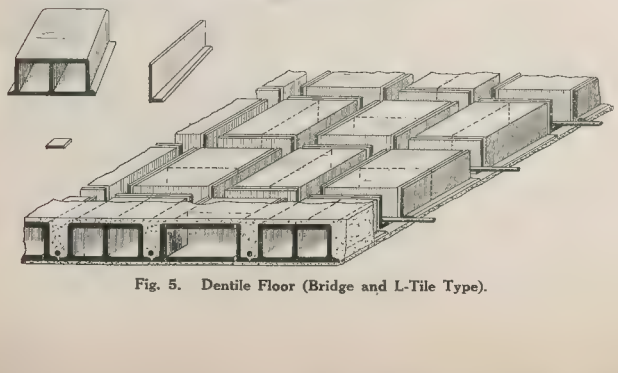

Fig. 5. Dentile Floor (Bridge and L-Tile Type).

ie System. Messrs. Leslie & Co., of Kensington, have patented a system nstruction which depends upon a special of secondary reinforcement for beams loors. The object is to provide for ing together the whole of the reinforce- rigidly and securely, so that none of the nts can be displaced accidentally or vise while the concrete is being deposited. 1 represents in perspective the on reinforcement for a continuous beam. main reinforcement consists of straight ent tension bars, the ends of the latter carried over the supporting column and nued for a sufficient length beyond to tension due to negative bending nts.

e web reinforcement, which is the special e of the Leslie system, consists of rs formed of steel strip bent over at end to enclose the main bars, or to e one bar while the other end is bent ht angles for anchorage in the concrete rts where there is no bar in the upper n of the beam. The hangers are locked ace by means of links driven over the -shaped bent-over ends, as shown by o details at the bottom of Fig. 1. The rs may be placed vertically or at an . as may be preferred, and the complete ton reinforcement for beams can be bled before being placed in the moulds. e chief advantages claimed for this n are thus stated by the patentees :— nangers are rigid, of any length, and any ng; there are no loose members; the od of manufacture eliminates errors of manship; and the method of building up skeleton beforehand obviates the risk splacement.

is also claimed that the rigid attachment e vertical hangers to the main bars is as efficient as if the vertical members formed out of the main bars, and that s the advantage of enabling the hangers e spaced at various distances apart as red.

ree forms of transverse reinforcement for ns adopted by Messrs. Leslie & Co. llustrated in Figs. 2, 3, and 4. One of (Fig. 2) is simply a single wire tie ng around the longitudinal bars, another 3) is a similar arrangement wherein the re continued in the form of a diagonal dditional reinforcement of the core, and hird (Fig. 4) shows a spiral winding.

ssrs. Leslie & Co., Ltd., are contractors engineers, and themselves carry out all s designed by them on their patented ms, and take full responsibility for both ns and actual construction.

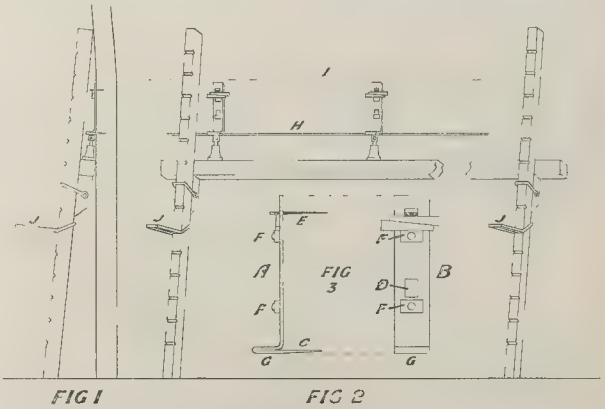
ESTON'S PATENT WALL STRAIGHTENER.



ERY District Surveyor will tell us that ay to straighten a wall when it is out of perpendicular is to pull it down and ld it. The remedy is an old and excellent but the man who foots the bill may wish less costly alternative.

at is the aim in the system here shown, t is claimed that the wall will be stronger he treatment. In the sketch, Fig. 1 sents a cross-section of the wall, Fig. 2 nt elevation. Supports of square timber used of suitable height, which incline st the wall; these carry the horizontal er, which is adjustable in height to suit lift as the work progresses.

e wall is first freed from structural attach- , if any, and upon the overhanging side owest point is found at which the wall s to incline out of plumb. Here the is raked out, much more deeply than for ing, and at intervals cut with a thin ent chisel 4½ in. deep. Into these are the brackets, which are shown enlarged ig. 3, A being edge and B front view. toe, C, is driven in up to the back plate, through the holes D are driven tapering chisels E into the joint, the heads of being wedged up from the abutment F. hat when fixed in place the bracket nes a part of the wall. There must be ushing of the brick or movement of the ket. the size of which and the number isel grips it contains will depend upon weight or mass to be lifted, and upon extent of the work will depend the ber of brackets required, in order to ise the movement as much as possible, although they may be removed from one end and applied again at the other as the work proceeds, if the length necessitates that.

Assuming that the brackets are in place, a lifting jack resting upon the cross-timber is placed under the heel G of each bracket. The lifting requires care, and it is best to move the screws a little at a time with pauses between, in order that no vibration or rocking movement is set up, during which time the wall should be examined with a plumb rule. A crack will have opened in the joint, which may now be cleared out and wetted, cement and sand being used as a bedding for a length of ⅜ in. light hooping, which is placed therein, passing under the brackets and being turned up into a vertical joint at either end. The joint is now filled with cement, and slate is driven in above the hooping with a caulking tool, which leaves the joint ready for pointing. It will now be found that the jacks can be removed without unscrewing, as the slate has taken the weight off them. The sketch illustrates that a lift has been taken at the open joint H, and that the wall is vertical to that height; the next lift is to be taken at the dotted line I. The brackets J hold a couple of scaffold boards, from which the jacks and brackets are manipulated.

It will be manifest that in the horizontal measurement of any wall partially out of plumb or bulged the distance between any two points must be greater measured at the top or bulged part than at the base; therefore

A Patent Wall Straightener.

it must be seen that provision exists, or is made, for the closing up again of the vertical joints that have opened as a consequence of the leaning.

If it be a boundary wall, for instance, probably the pointing at the top would make it rigid, and it would require a joint cutting out with a thin cross-cut chisel at short intervals across the top, otherwise it would lift in coming back to the straight line.

With the means here shown the work of straightening is very quickly and cheaply carried out, and when the wall is pointed it is stronger by reason of the iron bond than when newly built. It is convenient to remember that pulling down and rebuilding is not the only remedy for a leaning wall, yet it is only occasionally that such a thing is needed, and appliances of this sort therefore are more the province of those who would specialise and undertake such work, which extends to the treatment of sinkages as well, in some cases avoiding the necessity of underpinning.

Mr. B. S. Weston, No. 5, Parkholme-road, Dalston, N.E., is the author of the patent.

PROTECTIVE AND DECORATIVE METALLIC COATINGS.

THE earliest known process is that of copper upon iron, by the dipping of the iron article in a solution of copper sulphate; followed early in the XIXth century by the electrical deposition of zinc, copper, nickel, silver, and the rarer metals.

The protection thus afforded from atmospheric corrosion, and the production of artistic effects, has been extended to cases where economy was an important consideration, and hot dipping of iron and copper sheets in tin, known as "tinning," and of iron sheets and bars in zinc, known as galvanising, has become very general. The last named, hitherto the least expensive method, has not, however, been wholly satisfactory, either to the manufacturer who has experienced loss of zinc by contamination with iron, or to the user who has frequently found the coating defective as a protector, and the cause of weakness in the iron covered.

Some articles could not be treated because they suffered distortion when dipped hot; and others that required "tempering" were spoilt by the temperature of the operation.

As the result of some experiments made in 1902 upon the annealing of cast-iron, Mr. Sherard Osborn Cowper-Coles, of Westminster, found that zinc dust when in contact with another metal, say, a piece of iron, and heated to a temperature of several hundred degrees below its melting point, is quickly coated with zinc. He found that at 200 deg. C. a beautifully adherent deposit of zinc was thus obtained, as contrasted with 418 deg. C., the melting-point of zinc necessary for the dipping method. Another advantage is that the deposit is beautifully smooth, and even small screws may be treated in this way—now known as "Sherardising," from the Christian name of the inventor—without it being necessary to re-thread them.

As to the protective value of the process, seven or eight years ago, in its early days, pulley blocks were "Sherardised," which have been in use in the open air ever since, and which are as good to-day as when they left the factory, with the exception of the wear and tear on the chains. They have been exposed every winter and summer to all changes in the weather.

Another important point with regard to this process was that it showed mechanical faults in the articles. If a bad weld were present, or a crack in a tube, it was revealed by the process. Again, owing to the time character of the operation, a slow rise of temperature followed by a slow cooling, the articles were extremely well annealed; and the result was that chains and such articles as were struck from a bar, or bolts or nuts which were struck in a machine and immediately cooled by a flow of water, were actually stronger and would stand work much better after the process than before. In the case of chains, and many other goods, the increase of strength was about 5 per cent. Springs also can be "Sherardised" without their temper being affected, and large quantities of springs are treated for exposure out of doors.

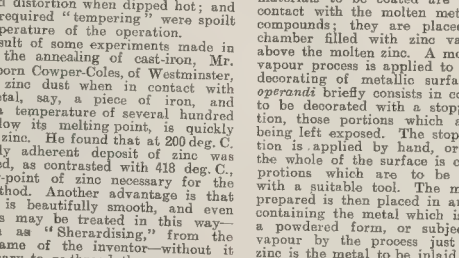
The temperature of treatment, began at 160 deg. C. with mild steel, and is 200 deg. C. with cast-iron. The use of a quarter of an ounce of zinc per square foot, applied by "Sherardising," was quite as effective as 2 oz. applied by wet galvanising, a consumption of only one-eighth of the protecting metal.

The zinc coating shows for a short time a slight yellowish powder, but this soon washes off, and the protection thus afforded is very resistant to atmospheric corrosion, for the iron does not rust even when the zinc surface has been removed by abrasion.

Mr. J. W. Hinchley believes the correct explanation of the "Sherardising" as above described is that the deposition begins at a temperature just above that required to produce a film of magnetic oxide on the iron, and the deposit invariably contains iron. He concludes that the coating is a closely adherent film of a solid solution of iron in zinc produced by the interaction of the metallic zinc in the zinc dust and the film of magnetic oxide of iron.

This is an important consideration taken in conjunction with the fact that iron is now largely protected by the Bower-Barff process, which is essentially the formation of a coating of magnetic oxide of iron. That substance, $Fe_3\ O_4$, is formed upon the surface of perfectly cleansed iron by the interaction with the metallic iron of superheated steam. By heating the articles within a red-hot retort and passing thereinto a jet of superheated steam, an effectual protection is secured. Rustless iron pans are now in general use, and several of the London gas companies treat their cooking stoves in this way with very satisfactory results.

But distinct from "Sherardising" Mr. Cowper-Coles has a method, where the materials to be coated are not brought into contact with the molten metal or any of its compounds; they are placed in a separate chamber filled with zinc vapour, or placed above the molten zinc. A modification of this vapour process is applied to the inlaying and decorating of metallic surfaces. The *modus operandi* briefly consists in coating the article to be decorated with a stopping-off composition, those portions which are to be inlaid being left exposed. The stopping-off composition is applied by hand, or by stencils; or the whole of the surface is coated, and those protions which are to be inlaid removed with a suitable tool. The metal object thus prepared is then placed in an iron receptacle containing the metal which is to be inlaid in a powdered form, or subjected to metallic vapour by the process just referred to. If zinc is the metal to be inlaid, zinc dust is the powder employed. When the article has obtained the desired depth of inlay and onlay, it is allowed to cool, and then removed and brushed with a stiff brush to remove the stopping-off composition.



The vapour process, says Mr. Cowper-Coles, enables a variety of effects to be obtained and a number of metals to be blended together which hitherto has been impossible, and alloys of many colours and tints to be obtained in the one operation. The thickness and depth to which the metals are to be inlaid and onlaid can be controlled at the will of the operator. This vapour process of burning in and blending metals enables very beautiful colour effects to be obtained, the colours ranging from silver-white to yellow brass and bronzes of various shades, graduating to copper. A unique and charming effect that the inlay has not the sharp line of demarcation of damascening and similar process but a soft transititon from the inlaid me to the surrounding one. For example, w an inlay of zinc in copper, the zinc is s rounded by a band or halo of a gold coloured alloy. This process of inlaying not confined to zinc and copper, it has b successfully applied to such metals as nick cobalt, antimony, and aluminium.

A method having distinctive features in procedure and in its range of applicabil is that of Mr. U. Schoop, of Zurich, descri in the *Comptes rendu* of 1910.

Objects can be covered with a deposit any fusible metal or alloy, containing components in eutectic proportions, by p jecting the fluid through a suitable jet, means of some indifferent gas under pressu A coating of from ·02 mm. = 0·008 in. to seve millimetres in thickness can be thus produc upon almost any material. The temperatu of the steam of metallic particles just o side the jet is between 10 deg. and 60 deg. The pressure used is high, being 20 to 25 ki per square centimetre = 284 lb. to 355 lb. square inch, or approximately 20 to 25 atm spheres. With the latter pressure the metal particles have a speed calculated to be equal $12\frac{1}{2}$ miles per second. This enormous speed twenty-five times that of the bullet from gun used in the German army—of the metal mist produces metallic surfaces of a surprising high density. For instance, one of sprayed was of density 7·42, almost equal to that rolled tin, namely, 7·47. Tin, lead, copper, aluminium, and its alloys, can be deposit by this process, which is also adaptable to making of *clichés* (stereotype plates). T object to be coated is passed through a cha ber, *i*, into which the molten metal from crucible, *e*, is projected in a highly atomis condition. The spray is produced by forci the metal from the crucible by an inert gas a pressure of about 25 atmospheres into very fine nozzle, *g*, when it meets a jet of previously heated in a coil, *c*, and passing right angles to the nozzle, *g*. By using oxidising gas at the jet a coating of oxi may be obtained in some cases—*e.g.*, le peroxide may be deposited in a firmly adh ing film in this way. Alloys may be deposi by simultaneously spraying two differe metals from separate jets. Among oth applications, the process may be applied the coating of wood, paper, and glass, and a balloon an aluminium coating $\frac{1}{10}$ millime thick is sufficient to render it quite gas tigh

It is possible to coat otherwise inflammab materials, because the metallic mist is at comparatively low temperature when impinges upon them, say, 40 deg. to 60 deg. in spite of the fact that the molten metal h a temperature of several hundred degre (*e.g.*, for zinc, 418 deg. C.) at the instant efflux, and so also has the atomising ga This sudden reduction of tension of the g cools it, and in turn it assists in cooling t metal mist which presents, relative to weight, an enormous surface. Paper, woo celluloid, and wax may consequently covered, and that with a metal film of hard ness greater than that of metallic films p duced by casting or rolling. The individu particles of the metal when atomised described, lose their surface tension and the globular form, and are pressed out on t surface presented as a circular film. The films overlapping, become, at the high veloc of the particles, automatically welded in a continuous homogeneous coating. Micr scopic examination of the resulting surfa shows it to be absolutely homogeneous, a has shown that, under the pressures employe metals alloy much more readily and quickl than under the pressure of a single atm sphere. Different metals have, of course, be treated according to their melting-poin fluidity, oxidising property, specific gravity etc., whilst the crucibles employed must suitable, *e.g.*, for aluminium and its allo steel crucibles cannot be used; but in thi respect there is nothing new to metallurgica practice. The surface to be coated is fir freed from oxide or adhering dirt, and whe metals are to be coated it is an advantage although not a necessity, to heat the surfac before spraying upon it. Paper may b coated with metal; the wooden propellers o aeroplanes coated in this manner have their friction considerably reduced, and wall paper textiles, and stage scenery can all receive metallic coating.

With a portable apparatus metallic struc tures, such as bridges, machinery, and the like, could be readily coated with aluminium and thus made to withstand atmospheric influences better than any known method.

Apparatus for Metallic Coating.

THE BUILDING TRADE.

ADE DISPUTES AND OLONIAL AND FOREIGN GISLATION.

' a time when this country is recovering from a strike affecting one of the chief necessaries of life a Yellow of considerable interest has made its ance in the form of memoranda prepared Labour Department of the Board of Trade operation of certain laws in the British ions and foreign countries affecting and lock-outs. We in this country far iscouraging strikes and lock-outs may be ther to have encouraged them. It is not ry here to trace the history of the trade or the evolution of the law of conspiracy nexion with these societies. To support ve proposition it is sufficient to refer to ade Disputes Act, 1906, which in the f trade disputes amended the law of racy, legalised "peaceful persuasion," l contracts of employment to be inter- ith, or the rights of persons to dispose ir labour and capital to be subject ference, without an action being open to whose rights were trespassed upon, and, which prohibited an action being brought court against a trade union in respect of s or wrongful acts alleged to have been ted by or on behalf of the trade union.

in this country strikes are not only not but persons acting "in contemplation or ance" of trade disputes are placed in a ed position, and societies who organise and lock-outs have their funds secured so rsons who have suffered damage through strumentality can have no redress in the

A trade union acting in contemplation nerance of a trade dispute can instigate nbers to smash windows without being able to pay compensation out of its funds. ing the case, it is interesting to see what attitude of some foreign countries and f our colonies towards this question of but the subject is too large to be dealt all comfortably in one short paper.

ng regard to the course of events in this , the points deserving most attention in s of other countries would appear to be attitude of Dominion and foreign on towards lock-outs and strikes gener- ?) special provisions in regard to what wn as services of public utility ; (3) the of trade unions and their members ; attitude of the Legislatures as regards ful persuasion."

regards the first head, the great variety arious laws do not permit of them being in detail here, but it may be stated y that in the Dominions the tendency ern legislation has been to restrict the f combined action in industrial disputes. ial courts have been established and the of persons to lock-out and strike are to restrictions. In Queensland alone appear that no restrictions are placed right to lock-out and strike, and in the restriction is very limited. In the ons this legislation is often general in its and therefore the services of general hough subject to special conditions, are distinctly legislated for as in other s. In Western Australia, and possibly South Wales, lock-outs and strikes to be absolutely prohibited. In the l foreign countries the tendency, on the and, is to legislate specially for services ic utility. In France and the United here is less restriction than in other s, and it is a matter of common know- at industrial disputes of a serious nature erienced in these countries. It may, , be observed in this connexion that the ental memoranda contain no informa- o the law in Norway and Sweden.

s regards the "services of public these are variously defined in the colonies and countries. In New Wales "necessary commodities" include s, water for domestic purposes, and any f food the deprivation of which may endanger human life or cause serious njury." In New Zealand, besides gas, y, and water supply, are included the supply of meat, the supply of milk, the sale or delivery of coal, and the transport services. In the foreign countries the legislation is aimed at securing to the public the necessary services of public utility. In these services strikes are absolutely prohibited in Russia, Holland, Belgium, Italy, and Roumania. The absence of mining from these services is a noticeable feature, but in Canada, Austria, Nova Scotia, and the Transvaal we find it specified.

III. As regards the liability of trade unions, not very much information can be gathered from the memoranda, but it must be borne in mind that the general legislation restricting industrial disputes has an important bearing on this subject, because the powers of unions are more limited than in this country. However, we find that in New South Wales, where a member of a union has been convicted of an offence against the law relating to lock-outs and strikes, the industrial court may order the trustees of the union or any branch of it to pay out of the funds a sum not exceeding 20*l*. In Western Australia no part of the funds of a union are to be employed in aiding strikes and lock-outs. In New Zealand the unions may sue or be sued, and when a majority of members are party to a strike the union is deemed to have instigated the strike.

IV. With reference to "peaceful persuasion," this seems hardly to be either legalised or prohibited in express terms, most of the legislation being directed to intimidation. In this country we have seen fit to legalise "peaceful persuasion" without duly safeguarding the abuse of this privilege.

The nearest case we can find to a limitation on peaceful persuasion appears in the Spanish law: "Any person who, in order to organise, maintain, or prevent associations of employers or workpeople, strikes or lock-outs, shall make use of violence or threats, or shall *exercise pressure* of such a nature as to constrain or force the will of workpeople or employers in the free and legal exercise of their trade or work," shall be liable to imprisonment or a fine. Again, in the Report of the United States Industrial Commission some doubt is expressed as to the legality of even peaceful persuasion. In Belgium the freedom to work is safeguarded by rendering liable to imprisonment for a period of one month to two years and a fine of from 50 francs to 1,000 francs those who "threaten the liberty of masters or workpeople by congregating in the neighbourhood of the works or the dwellings of those who direct the work or by committing acts of intimidation against people going to, or returning from, work."

In Germany, "whosoever by means of physical force, threats, insult, or defamation" shall persuade or endeavour to persuade others to take part in or to withdraw from combinations is liable to imprisonment.

In Portugal it is an offence "in any way to use pressure tending to diminish the liberty of the employed or employers in the legal exercise of their work or industry."

In the limited space of one article little more can be done than to indicate the general trend of legislation in relation to industrial matters, but much may be learnt from the collective experience expressed on these subjects by the laws of other countries. The establishment of industrial courts, besides imposing restrictions on industrial warfare, encourages conciliation, and we may at the moment in especial point out that during the currency of disputes the intervention of an industrial tribunal is far to be preferred to legislative interference by Governments. The security also of services of public utility would seem to deserve attention in this country after recent experiences.

In conclusion, it may again be pointed out that we, among all nations, appear to stand alone in the departure we have taken in the Trade Disputes Act in encouraging, rather than restricting, the militant action of trade unions and their members in relation to trade disputes.

COUNCIL OFFICES, SHERINGHAM.

These new offices have been erected at a cost of about 1,285*l*. from the designs of Messrs. Stanley Simons & Co., architects, of Sheringham, and the contractors were Messrs. Blyth & Son, also of Sheringham.

TRADE UNIONS, 1908-10.

THE Board of Trade have recently issued a Report on trade unions for the three years 1908-10. Whilst so much is being thought and said about the militant attitude which trade unions have especially adopted since they sought to become political societies it is well to remember that they have other functions, and a reference to the pages of this Report will show that their expenditure in the three years under review on sick, superannuation, funeral, and other benefits amounted to the sum of 3,180,000*l*., an increase of 14 per cent. on the three preceding years. In the same period the dispute benefit amounted to 1,120,000*l*., and unemployed benefit to 2,650,000*l*. The above are the figures relating to 100 principal trade unions, which have three-fifths of the total number of trade union members. It appears from the Report that years of slack employment tend to diminish the number of trade union members. The bad years of 1908-9 were marked by a diminution in membership of 57,000, but the more prosperous year 1910 showed an increase of 73,600 members.

In the building trade at the end of 1910 there were sixty-eight trade unions with a membership of 155,923, but all the unions in this trade showed a diminished membership as compared with 1907, the mean income per head was nearly seventeen shillings higher than in the last triennial period, a consid rable advance in contributions having been rendered necessary by the slack condition of the trade. In the three years under review the total expenditure of the principal unions in the building trade was 1,344,005*l*., of which only 5 per cent. was on dispute benefit, 31·1 per cent. on unemployment, 22·9 per cent. on sick and accident benefit, 18 per cent. on superannuation benefit. The expenditure on dispute benefit was much lower in proportion than that of many of the other unions.

LOCAL BY-LAWS.

OF recent years the work devolving upon the contractor has been rendered more arduous than formerly by the fact that he has to conform to local by-laws. Whatever the vagaries of the local authority, they must be respected, provided they are embodied in by-laws which will be upheld as reasonable by the Court. In view of the fact that those who are employed in and about the erection of a building—namely, the builder and the architect—are presumed to know sufficient of the law to protect the building owner, a few notes on local by-laws may not be out of place.

A by-law is an ordinance affecting the public, or some portion of the public, imposed by some authority clothed with statutory powers ordering something to be done or not to be done, and accompanied by some sanction or penalty for its non-observance. In order to be valid a by-law must be certain and reasonable. Lord Russell of Killowen once declared that by-laws would be unreasonable "if they were found to be partial or unequal in their operations as between different classes; if they were manifestly unjust; if they disclosed bad faith; if they involved such oppression or gratuitous interference with the rights of those subject to them as could find no justification in the minds of reasonable men." A by-law is also invalid if it is repugnant to the general law of the land, or if it adds something inconsistent with the provisions of a statute creating the same offence; but if it adds something not inconsistent that is not sufficient to make it bad or repugnant.

The due observance of by-laws which govern the erection of buildings is of great importance to the builder, for it has been held that a contract to erect a wooden structure containing the provisions of a statute is illegal, and the builder cannot sue upon it. By a parity of reasoning, the cost of work done on a building erected contrary to the provisions of a valid by-law could probably not be recovered. It was held in a Canadian case that where a man contracted to erect a building the construction of which was rendered illegal by a

subsequent by-law, he could not recover either on a contract or as on a *quantum meruit*.

Again, from the point of view of the building owner, the erection of a building in contravention of a by-law may be fraught with serious consequences. Thus, where a contract has been entered into to erect an illegal building, and any substantial part of the contract has been performed, instalments paid by the employer cannot be recovered back by him.

Another important point is that where by-laws have once been validly made and confirmed, and are in force in a district, the local authority which made them cannot dispense with their requirements in any individual case, unless the by-laws themselves give the local authority such a dispensing power. For example, it was held in Yabbicom *v.* King (1899), 1 Q.B. 444, that a local authority empowered to make by-laws for the regulation of buildings within its district has no power to sanction plans in contravention of the by-laws properly made. If, however, upon hearing an information for a breach of a by-law the justices are of opinion that, having regard to the purposes for which the by-law was made, it is unnecessary to enforce it in the special circumstances of the case, they may in the exercise of their discretion, notwithstanding that a breach has, in fact, been committed, dismiss the information or impose only a nominal penalty.

RAILWAY AND CANAL TRAFFIC.

THE annual general meeting of the Mansion House Association on Railway and Canal Traffic for the United Kingdom was held on the 26th ult., at the Westminster Palace Hotel, London, S.W. The meeting was followed by a conference of members of the Association and representatives of county, municipal, and local authorities, and chambers of commerce and agriculture, and other kindred organisations, presided over by Sir Alfred Mond, Bart., M.P. (the President of the Association), at which the proposed Government legislation respecting the Railway and Canal Traffic Act, 1894, and also certain matters dealt with in the Report of the Departmental Committee on Railway Agreement and Amalgamations were considered.

After a discussion the following resolutions were unanimously adopted:

1. "That this Conference is of opinion that the proposed Government legislation respecting the Railway and Canal Traffic Act, 1894, as explained by the President of the Board of Trade, would be prejudicial to trade and agricultural interests, and resolves, therefore, to oppose such legislation, or any measure which may be calculated to destroy or diminish the protection afforded by the Act."

2. "That this Conference is apprehensive that legislation giving effect to certain of the recommendations of the Departmental Committee on Railway Agreements and Amalgamations will be detrimental to traders and agriculturists, as that Committee, while expressing themselves in favour of 'the more complete elimination of competition' between railway companies, and giving them greater freedom to enter into agreements with each other, fails to recommend any safeguards for traders and agriculturists under such new conditions; and resolves that no legislation will be satisfactory to traders and agriculturists that does not remedy their long standing grievances, and, in particular, restore to them the right of appeal against any rate or charge."

The gentlemen present at the Conference were subsequently received, as a deputation by Mr. J. M. Robertson, M.P., Parliamentary Secretary to the Board of Trade, in the unavoidable absence of the Right Hon. Sydney Buxton, M.P., the President of that Department.

The deputation was introduced by Sir Alfred Mond, who was supported by Mr. Basil E. Peto, M.P., and other speakers. Mr. Robertson informed the deputation that their views should be placed fully before the President of the Board of Trade.

GAS POWER AND STEAM.

IN a lecture before the Society of Engineers and Metallurgists on the economy of gas power over steam, Mr. Alan Chorlton, of Messrs. Mather & Platt, Ltd., Manchester claimed that so completely satisfactory and reliable had the gas engine now become that every day saw its application extended to duties so difficult and onerous that only a few years ago they would have been thought impossible of achievement. The invention of the producer, its progress and improvement to date, had, of course, extended the field of the gas engine enormously. Mechanical and thermal efficiencies had steadily increased in recent years, and the reliability of the gas engine had been brought up to the standard of the one-time omnipotent steam engine. A waste gas that was at present receiving more attention even than that from blast furnaces was that which was obtained from the by-product coke ovens. These ovens were now at work or being laid down in considerable numbers in this country, but even in this matter we were far behind the expansion that was taking place in Germany. Such was this expansion that, with the typical German ability of working together, the coke-oven owners were now selling large quantities of waste gas from these ovens for illuminating purposes in the adjacent towns. In this country the only place where such illumination was carried out was Little Hulton. Mr. Chorlton predicted that when further progress of this nature took place in districts adjacent to coalfields it would last of all affect Sheffield, which already compared favourably in the price of gas supplied retail (11d.) with that supplied in gross by the German concerns (8½d.).

GENERAL BUILDING NEWS.

NEW PARISH CHURCH, KIRKINTILLOCH.

The plans for the new parish church at Kirkintilloch have just been approved by the local authorities, and the work will be proceeded with immediately. They have been prepared by Messrs. Clarke & Bell, architects, of Glasgow, and provide for a building to seat 1,212 persons. The church is to be built on the vacant ground in front of the existing manse, and the total cost is estimated at 14,000*l.*, half of which has been subscribed, while the other half will be raised by an assessment on the heritors of the parish. The principal feature of the exterior will be a tower, about 120 ft. high, which marks the main entrance to the building. Internally, an end gallery only will be provided.

CHURCH OF ST. JAMES, ALPERTON.

The Bishop of London consecrated the new Church of St. James, Alperton, on Easter Eve. The new church, which lies between Wembley and Perivale, provides accommodation for 750 persons, and consists of nave, aisles, a morning chapel being upon the south side of the chancel. The church is built of brick with red dressings and Castleton stone externally, with Farleigh stone internally, and plastered walls; the roofs are covered with hand-made tiles. A narthex extends over the west front. The cost was about 7,800*l.* The architect was Mr. William A. Pite, F.R.I.B.A.

NEW BUILDINGS IN LONDON.

Picture palace, Lewisham, S.E.; Mr. A. Roberts, architect, 113, Lewisham High-road, S.E. Additions to Messrs. John Knight's soap works, Silvertown, E.; Mr. W. Stewart, architect, 2, Aldgate, E. Imperial College of Science, Prince Consort-road, Kensington, S.W.; Messrs. Dove Brothers, builders, 15, Studd-street, Islington, N. Shops, Notting Hill, W.; Mr. S. Newcumbe, architect, The Studios, Pembroke-road, W. Granary at Kidd's Flour Mills, Isleworth, W.; Messrs. Simon, Ltd., milling engineers, Mount-street, Manchester. Warehouse, Earl-street, Finsbury, E.C. Messrs. Gordon & Gunton, architects, Blomfield House, E.C.; Messrs. Ford & Walton, builders, 242, High street, Kilburn, N.W.

TRADE NEWS.

The contract for the complete installation of lifts for the new buildings of the Institution of Civil Engineers, London, has been entrusted to Messrs. Smith, Major, & Stevens, Ltd., of London and Northampton, their Standard machine with Vee wheel drive, which renders overwinding impossible, having been selected. The three main passenger lifts will be fitted with their patent full automatic button system of control.

Horden Church, Co. Durham, is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT the last meeting of the London County Council before the Easter recess the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Dulwich.—Erection of porches to two houses on the eastern side of Underhill-road, Dulwich (Mr. R. Johnson).—Consent.

Finsbury, East.—Projecting swing cra the rear of No. 38, Finsbury-square, Fins next to Wilson-street (Messrs. Dav Emanuel for Messrs. A. Oppenheimer & C Consent.

Hackney, North.—Retention of four ste No. 4, Market-parade, Stamford Hill (M Joel).—Consent.

Hampstead.—Retention of a bay-windo the erection of a hood at a house upon abutting upon a proposed new road le out of St. Cuthbert's-road, Hampstead (M Rix & Wilkins).—Consent.

Kensington, North.—Illuminated sig Notting Hill-gate Tube railway-station, street, Notting Hill (Mr. R. Moss fo Central London Railway Company).—Co

Lewisham.—Erection of a one-story ad to the house known as "The Retreat," S ham Park-road, Forest Hill (Mr. A. R. worth for Mr. F. Day).—Refused.

Norwood.—Retention of a building us a coal store at No. 1, Carnegie-terrace, H Hill-road, Norwood (Mr. H. T. Gardn Consent.

Wandsworth.—Bay-windows, porches, jecting mouldings and sham half-timber in the gables of thirteen houses on the western side and twelve houses on the eastern side of Brookview-road, Stre (Messrs. E. & A. Wates).—Consent.

Westminster.†—Illuminated sign at N Victoria-street, Westminster (Mr. E. R. more for Mr. Maison Stehr).—Consent.

Width of Way.

Woolwich.—Addition at No. 56, Vic road, Woolwich, at less than the pres distance from the centre of the roadw such street (Mr. E. H. Wright for M Townley).—Consent.

Width of Way and Lines of Fronta

Hammersmith.—Erection of a buildi the western side of Galena-road, King Hammersmith (Mr. J. T. Weatherbu Consent.

Lewisham.—Erection of eight houses south-western side of Cliff-view-road, ham, with porches, half-timber work bargeboards (Mr. F. Howkins).—Consent

Peckham.—Erection of a one-story ad at the rear of Nos. 91, 93, and 95, Ry Peckham, to abut upon the northern Moncrieff-street (Messrs. North & Rol Consent.

Woolwich.—Erection of a two-story window in front of No. 56, Bercsford Woolwich (Mr. R. J. Bolton).—Consent.

Lines of Frontage, Space at Rear, Projections.

Greenwich.—Erection of three houses one-story wooden bay-windows on the so side of Ravensbourne-place, Greenwich G. T. Young for Mr. A. Bentley).—Con

Line of Frontage, Space at Rear, Working-class Dwellings.

Fulham.—One-story building on the w side of site (Mr. V. Wilkins for the Gov of the Peabody Donation Fund).—Conse

Lines of Frontage and Constructio

Clapham.—Iron sign at the entrance premises of the Direct Supply Aerated Company, Ltd., on the eastern side of hill, Clapham (Mr. J. F. Wetherell f Direct Supply Aerated Water Company, —Consent.

Lewisham.—Erection of a wood and building of a temporary character upon on the south-eastern side of Bovene Lewisham (Messrs. Bingham & Brough Consent.

Marylebone, East.—Iron and glass she the entrance to, and one at the exit Baker-street station, Marylebone-road Marylebone (Mr. W. Willox for the politan Railway Company).—Consent.

Marylebone, West.—Erection of an ir concrete stand at Lord's Cricket Grou the north-western side of St. John's Woo St. Marylebone (Messrs. McDowall, Ste Co., Ltd., for the Middlesex Cricket C Consent.

Paddington, South.—Wood and glass case at No. 134, Westbourne-grove, Pa ton (Mrs. A. Rubinstein).—Consent.

St. Pancras, South.—Erection of an ir glass shelter at the entrance to the Hotel, Tottenham Court-road. St. P (Messrs. Seth Smith & Monro).—Conse

Wandsworth.†—Wooden coffee-stall of porary character on the northern s Blackshaw-road, Tooting (Mr. G. Manw —Consent.

Space at Rear.

Deptford.—Water-closet building at th of No. 3, Lewisham High-road, D

Messrs. Harling Brothers for Miss Dixie).—Consent

Space at Rear and Projections.

Marylebone, East.—Erection of a block of ats upon a site abutting upon the eastern de of Upper Baker-street, St. Marylebone Mr. W. Willox for the Metropolitan Railway ompany).—Consent.

Alteration of Buildings.

Chelsea.—Erection of a water-closet and athroom addition at the rear of No. 41. ing's-road, Chelsea (Mr. W. Withers).—onsent.

Lewisham.—Additional story at No. 145, erry-vale, Lewisham (Mr. A. R. Westworth or Mr. M. Healy).—Consent.

St. George, Hanover square.—Alterations at o. 25, Hanover-square (Messrs. Bannan & owe).—Refused.

Cubical Extent.

Bow and Bromley. Additional cubical extent at the premises of Spratt's Patent, Ltd., awe-street, Poplar (Messrs. Max Clark & arbutt).—Consent.

Finsbury.—Additional cubical extent in espect of a proposed bank and factory building at the corner of Goswell-road and Upper harles-street, Finsbury (Messrs. F. Boreham, on, & Gladding).—Refused.

Uniting of Buildings.

City of London.—Uniting of Nos. 13 and 14, lomfield-street with No. 46, New Broad-street, ity, so far as relates to the erection of a azed partition across the room used as a erk's office at the rear of No. 46, New road-street, at the first-floor level, and the nstruction of two skylights in the roof of is room (Mr. A. R. Conder).—Consent.

Hackney, South.—Formation of a further pening between two factory buildings on the uthern side of Tynte-street, Hackney (Messrs. . S. Thomson & Co., Ltd.).—Consent.

St. George, Hanover-square.—Uniting of the erkeley Hotel, Berkeley-street, with adjoining premises on the northern side of Dover-rd (Mr. R. Griggs for the Berkeley Hotel ompany).—Consent.

Strand.—Formation of openings in the party ll at the basement and ground floor levels tween No. 100, Regent-street and No. 47. asshouse-street (Mr. A. Dawkins for the uascutum Company).—Consent.

Strand.—Uniting of No. 1, Duke-street with ulkner's Hotel, Villiers-street, Strand, by ans of openings at the first, second, and rd floor levels (Messrs. Batt & Hart for ulkner's Hotels).—Consent.

Westminster.—Formation of further openngs in the division walls of a warehouse ilding on the southern side of Vauxhall idge-road, Westminster (Mr. H. S. Stowell the Hovis Bread Flour Company, Ltd.).—nsent.

The recommendations marked † are contrary to the views of the Metropolitan Borough uncils concerned.

ROJECTED NEW BUILDINGS IN THE PROVINCES.*

BERGELE. Extensive alterations to station the London and North Western Railway mpany.

mersham (Bucks).—Isolation hospital; Mr. Hilsden, Surveyor, Rural District Council ces, Amersham.

xbroath.—Extensions to engineering works Messrs. James Keith & Blackman Com-y, Ltd.

edlington (Northumberland).—School; Mr. F. Forrest, architect, Moot Hall, Newle; Messrs. J. D. Cowieson & Co., builders.

rles street, Newcastle.

irkenhead.—Institute (3,000*l.*); Vicar, St. hael's Church, Birkenhead.

ournemouth. — St. Stephen's Vicarage, idley road; Mr. H. E. Hawker, architect, Peter's-chambers, Bournemouth.

radford.—Proposed buildings for epileptics imbeciles, Rooley lane (22,300*l.*); Mr. M. Crowther, Guardians' Offices, Bradford.

righton.—Royal Crescent Hotel, Marine ade; Messrs. Clayton & Black, architects. nce Albert-road, Brighton; Messrs. J. tth & Son, Ltd., builders, 106, Old Bond-et, W.

ristol.—Houses; Messrs. Oatley & Lawe, architects. Orchard street, Bristol. day-school; Messrs. W. V. & H. Gough, itects, 24, Bridge-street, Bristol; Messrs. tumphreys & Son, builders, Woodborough l, Bristol. Christian Assembly Rooms: ssrs. Oatley & Lawrence, architects, Edin-rgh-chambers, Baldwin street, Bristol; Mr. Dowling, builder, North-road, Bristol.

See also our list of Competitions, Contracts, on another page.

Burnley.—School, Lionel-street (6,000*l.*); Mr. H. H. Dunn, County Surveyor, Central-chambers, Cambridge.

Carnforth.—School (9,000*l.*); Mr. W. Rush worth, architect, Shire Hall, Durham.

Castleford Chapel, Carlton-street (5,000*l.*); Trustees, Wesleyan Chapel, Castleford.

Chatham. School, Ordnance street; Mr. C. Day, Surveyor, Town Hall, Chatham

Chorley. Extensions to bleachworks, Common Bank, for the Chorley Bleaching Company, Ltd.

Clitheroe.—School (14,850*l.*); Messrs. J. Bleayard & Sons, 9, Railway-view, Clitheroe.

Coatbridge.—School, corner of Drumpellier street (6,000*l.*), for the Old Monkland School Board.

Coventry.—Rectory (1,500*l.*); Vicar, St. John's Church, Coventry.

Deal.—Enlargement of school, North Wall (100 extra places); Mr. T. C. Golder, Surveyor, Town Hall, Deal.

Droylesden. — Extensions to premises (2,500*l.*) for the Co-operative Sundries Manufacturing Company.

Durham. — Parochial hall, St. Margaret's Church; Mr. W. H. Wood, North Bailey, Durham.

Easington.—Hotel, Seaside-lane, for Messrs. Nunmo & Sons, Ltd.

Eastleigh. — Isolation hospital (5,060*l.*); Messrs. H. Stevens & Co., builders, 126, Above bar, Southampton.

Eccles.—A plan has been passed for fifteen houses and house and shop, Matlock-street, for Mr. W. A. Norman

Edinburgh.—Motor garage, King Stables-road (3,000*l.*); Mr. T. D. Rhind, architect, 28, Rutland-street, Edinburgh. Picture theatre, Nicholson-square (2,000*l.*); Mr. W. N. Thomson, 87, Constitution street, Leith.

Elderslie (Johnstone).—Manual instruction centre at public school for the Paisley Landward School Board.

Erines.—Alterations and additions to Erines Mansion (5,000*l.*); Mr. W. Todd, architect, Lochgilphead.

Frampton (Boston, Lincs).—Vicarage; Mr. Jas Rowell, architect, 25, Norwood crescent, Southport; Messrs. J. Langley & Son, contractors, Kirkton, near Boston

Freshwater (Isle of Wight). Mansion; Mr. E. Harvey, architect, Grove road, Ventnor, Isle of Wight.

Frodingham.—Church of St. Lawrence; Sir Charles Nicholson & Corlette, architects, 2, New-square, Lincoln's Inn, W.C.

Gateshead.—Alterations to school, High West street (2,385*l.*); Messrs. Raven & Hitcham, builders, Gateshead

Gedling.—School, Mapperley Plains road (3,965*l.*); Mr. T. Bow, builder, Lemartine street, Nottingham

Gellifaelog.—School; Mr. J. L. Smith, architect, Aberdare; Messrs. Enoch Williams & Son, builders, Merthyr

Gerrard's Cross.—Banking premises and shops; Messrs. Cheston & Perkin, architects, 5, Union court, Old Broad-street, E.C.

Glasgow.—Additions to printing works; Mr. George Simpson, architect, 233, St. Vincent-street, Glasgow. Extensions to Sentinel Works, Polmadie road, for Messrs. Alley & Maclellan, Ltd.

Grays Special instruction centre (2,735*l.*); Messrs Brown Brothers, builders, Grays.

Haworth.—Public abattoir (800*l.*); Mr. James Redman, Surveyor, Council Offices, Haworth

Highcliffe (near Christchurch).—Residence; Mr. D. J. Barry, architect, 50, High-street, Reigate; Messrs. Thomas & Edge, builders, Anglesey-avenue, Woolwich, S.E

Hillhead (Glasgow).—Motor garage, Vinnicombe-street; Mr. D. V. Wyllie, architect, 102, Bath-street, Glasgow.

Hull.—Plans have been passed as follows:—Thirteen houses, Wellesley-avenue, for Mr. W. Garbutt; ten houses, Westbourne-avenue, for Mr. F. Neal; alterations, Waterloo Hotel, Wellington-lane, for the Hull Brewery Company, Ltd.; laboratory, Cato Mills, Wincolmlee, for the British Oil and Cake Mills, Ltd.; warehouse, Cottingham-road, for Mr. J. Mallison.

Ipswich.—Factory for the Diesel Engine Company.

Kirkheaton.—Addition to church; Vicar, Parish Church, Kirkheaton

Leeds.—Church, Buckingham House Estates (10,000*l.*), for the Christian Scientists.

Liversedge.—Extensions to warehouse, Mill bridge, for Messrs. Cooke, Sons, & Co.

Longfleet (Dorset).—Extension to church (5,000*l.*); Vicar, Longfleet.

Luton.—Factory; Messrs. J. R. Brown & Son, architects, Castle-street-chambers, Luton.

Maesmarchog.—Church; Mr. E. Evans Bevan, owner of Maesmarchog, Onlyn, and Seven Sisters Collieries, Neath.

Midsomer Norton.—Co-operative premises; Mr. W. F. Bird, architect, Midsomer Norton.

Newbiggin.—Institute (1,500*l.*); Mr. C. F. Murphy, architect, Morpeth.

Newbury.—Eleven houses (1,750*l.*); Messrs Hoskings Brothers, builders, West Mills, Newbury.

Newquay. — School; Mr. S. Williams, Builder, Bridgend, Wadebridge.

Northampton.—Plans have been passed as follows:—Ten houses, The Broadway, for Mr. A. Glenn; additions to Messrs. Rice & Co.'s foundry, Bridge street, for Messrs. P. Phipps & Co., Ltd.; four houses, Harborough-road, for Mr. H. Weaver; addition to factory, Lower Mounts, for Messrs. Wright Brothers; additions to "Good Intent" public-house, West-street, and "New Town House" public house, Lower Thrift street, for Messrs. P. Phipps & Co., Ltd.

Norwich.—Beet sugar factory. Mr. R. H. Weymouth, architect, 3, Victoria-street, S.W.

Nottingham.—School, Mundella-road. Mr. Frank B. Lewis, City Architect, Town Hall, Nottingham. Buildings, Pinder-street, for Messrs. Boot's Pure Drug Company.

Nuneaton.—Dining hall at workhouse (1,325*l.*); Mr. T. H. Smith, builder, Nuneaton.

Pickering.—Club premises, Market-place; Secretary, Conservative Club, Pickering.

Prospect.—Misison hall and adaptation of old chapel as Sunday-school, etc. (6,000*l.*); Bradford Mission Committee.

Rawdon (Yorks).—Woollen shed and engine and boiler house at Park Mills; Mr. George Foggitt, architect, Ashfield, Yeadon, Yorks.

Reading. — Enlargement of Kendrick Schools; Mr. H. T. Pugh, Secretary, Education Committee, Town Hall, Reading.

Rossington.—School; Mr. J. Stuart, County Hall, Wakefield.

Ryhope.—Parish offices (1,800*l.*); Mr. G. Brown, architect, 51, Fawcett-street, Sunderland.

Salford.—Building, Chapel-street; Messrs. D. C. Thomson & Co., Ltd., Dundee. School (14,640*l.*); Mr. A. Hodgkinson, builder, Manchester. Plans have been passed for alterations and additions to "Pickwick Inn," Oldfield street, and "Park Inn," Tatton street, also for works, Derwent-street.

Seacliff (Haddingtonshire). — Signalling station; Mr. G. Cunninghame, builder, Victoria-street, Dunbar.

Siddall (Halifax).—Church (8,000*l.*); Messrs Walsh & Nicholas, architects, Harrison-road, Halifax.

Silverhill (St. Leonards).—Church hall; Mr. P. Tree, architect, 63, Queen Victoria-street, E.C.

Southampton.—A plan has been passed for six houses, Hill-lane and Lumsden-avenue, and additions, 195, Shirley-road, for Messrs. Jurd & Sanders. Mr. J. Smith has lodged plans for twenty-eight houses in Wilton-road.

South Hiendley.—School; Mr. J. Stuart, County Hall, Wakefield.

South Ockenden.—Enlargement of school (2,800*l.*); Mr. F. W. Burtwell, builder, High street, Brentwood.

South Shields. Works at school, Ocean-road (1,410*l.*); Messrs. S. Sheriff & Son, builders, Back Woodbine street, South Shields.

Stepps (Glasgow).—Church hall, Parish Church (2,500*l.*); Mr. John Fairweather, architect, 136, Wellington-street, Glasgow.

Swansea.—Business premises, Castle-street; Messrs. Margrave & Peacock, architects, 20, Royal Exchange, Swansea; Messrs. J. & F. Weaver, builders, Mansel ton Steam Joinery Works, Swansea.

Tottington (near Bury). Premises for the Equitable Co-operative Society.

Twickenham.—A plan has been passed for six houses, Cambridge road, for Messrs. E. Evans & Sons

Wakefield. Building (4,000*l.*) for the Y.M.C.A. Wakefield. Extensions to infirmary, Messrs Simpson & Firth, architects, Wakefield.

Warrington.—A plan has been passed for twenty-two houses in Orford-lane for Mr. Peter Lawton. The Hon. Miss Wilson Patten has lodged plans for erection of Patten Hall, Museum-street.

Wednesbury.—School of science; Mr. Hutchings, Education Offices, Stafford.

Wellingborough.—Additions at schools; Mr G. Henson, builder, 149, Midland-road, Wellingborough.

West Aberdeen.—Factory, North Esplanade (2,000*l.*); Messrs. Wilson & Walker, 181A, Union-street, Aberdeen.

West Bridgeford.—School; Mr. L. Maggs, Shire Hall, Nottingham.

Woodhouse (Notts).—Golf clubhouse; Secretary, Sherwood Forest Golf Club, Woodhouse.

York.—Additions to premises, Mill-street, for the Tadcaster Tower Brewery.

Youghal.—Carnegie free library; Messrs. Chillingworth & Levis, architects, Cork.

The Demolition of Trentham Hall.

THE DEMOLITION OF TRENTHAM HALL.

TRENTHAM HALL, the country residence for a long period of the Duke and Duchess of Sutherland and their predecessors, is now in the hands of the housebreakers, and is in process of destruction. The Duke, for various good reasons, felt it was no longer desirable as a country residence, and his offer of it to the local authorities as a gift for the benefit of the people of the Potteries, to which it is adjacent, having been refused on the score of the cost of maintenance, there was nothing for it but to sell or destroy it, and the latter course is being taken, a sale by auction for demolition purposes having previously taken place. The tower is to be preserved elsewhere.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

A MEETING of this Association, presided over by the President (Engineer and Surveyor to the Chiswick Urban District Council), was held at the Town Hall, Twickenham, on Saturday, 30th ult., and was well attended.

A further discussion was raised on the motor omnibus and similar classes of traffic passing over all classes of roads. At the Association's meeting on February 3 the following resolution was passed :—"That, having regard to the great damage caused by motor omnibuses and other similar vehicles passing over various classes of roads not originally constructed to carry such traffic, this Association is of opinion that further powers should be conferred on Local authorities, enabling them to define the routes (other than county main roads) to be taken by any service of motor omnibuses or other motor vehicles licensed for hire or for the carriage of goods into or through their respective districts." It was further resolved : - "That a copy of the above resolution be sent to the Institution of Municipal and County Engineers, and that the Council of the Institution be requested to consider the subject-matter of such resolution, and to take such action as they may deem necessary." The Association received a letter from the Secretary of the Institution of Municipal and County Engineers stating that the Council had given careful consideration to the above resolution, and, on the recommendation of the Roads Committee, to which the matter was referred, the Council had resolved with regret that the resolution is of so far-reaching a character as to lend itself to unreasonable application, and, having regard to representations made by the Institution to the Local Government Board, pressing for amendment of the Highways and Locomotives Act, and the Heavy Motor Car Order of 1904, they could not see their way at present to take any further steps in the direction suggested by the resolution. The above Association were unanimously of opinion that possibly the wording of the resolution had not sufficiently marked the importance that it was intended to give powers dealing with district roads and not main roads, and recommended that the Institution of Municipal and County Engineers be again asked to consider the matter apart from the wording, and to consider it in the spirit of the resolution. It was further resolved that the Committee who had this matter under consideration be requested to allow the President of the Association to interview them regarding this matter, so as to be able to draw their attention to the views taken by this Association, they feeling that this matter is one of the greatest importance, more especially that, since passing the above resolution, the matter has been taken up on somewhat similar lines by the Metropolitan borough councils.

The Association also had under consideration the district nominations to the Council of the Institution of Municipal and County Engineers.

The Association also had under further discussion the visit to the sewage disposal works now in course of construction at Surbiton, when a vote of thanks was passed to Mr. Mather, the Engineer, and it was decided to request him to read a paper with reference to the works at an early date in the next session.

BOOKS.

The Art of the Romans. By H. B. WALTERS. (Methuen.)

MR. WALTERS's book is fortunate in the time of its appearance. Last year's National Exhibition at Rome, the recent foundation of the Society for the Promotion of Roman Studies, the re-organisation of the British School in Rome on broader lines now under discussion are a few of the many circumstances which have tended to revive interest in the art of ancient Rome, which had, perhaps, been rather overshadowed of late by the more penetrating fascination of Hellenic art. If the Roman art never reached the same calm heights of faultless achievement, it is yet of permanent importance in the general history of European art. For if Rome originated little or nothing in the strictly artistic domain she borrowed from various sources, combined and assimilated, then transmitted and diffused, and thus provided the starting-point of much that came afterwards. In art, as in politics, the Romans were great as organisers and administrators. But before they came under the spell by which Greece enslaved her conquerors they were by national temperament rather contemptuous of art. Mr. Walters aptly quotes the prophecy of Capys—"Leave to the Greek his marble nymphs"—though, by the way, he is unfair to poor Macaulay, who may have been, as he says, a Philistine, but cannot be convicted of it on such evidence as this. Had he not expressly stated in his preface that "the author speaks not in his own person, but in that of ancient minstrels," we might have guessed that the words of "Capys, the sightless seer," do not express Macaulay's own sentiments any more than Lady Macbeth does those of Shakespeare. Be this as it may, Mr. Walters does a useful w attempting to estimate the extent and of Rome's debt to Greece and the sh to the Etruscans and other races al in the Roman dominion, as well as in our attention to those branches of which Rome can claim some originali architecture, while the Romans them or the foreign artist whom they em never made a completely artistic between their own arcuate constructi the columnar architecture of Greece, retaining the latter as a decorative and applying it to far more varied use removed it out of its own limited and thus extended the range of its tialities. In this they rendered a service to architectural evolution, as that genius for co-ordination which them to conceive plans of the utmos plexity, comprising numerous buildin apartments, yet so grouped as to pro single orderly and symmetrical whole. the author is not an architect hims gather from his rather odd use of architectural terms. Thus, on pa "entablatures curved or triangular spoken of, when "pediments" wo clearer; and on page 40 the ar Titus is described as having a "doo where "opening," "arch," or " opening" would be more usual. It n doubted whether the claim which Walters appears to make for the Rom a monopoly of circular buildings is justified. In Greece several examp circular temples are known—*e.g.*, a dauros, Delphi, and Olympia. It is u ful, however, to quibble at these unimp details, for the chapter which he dev Roman architecture is as good as any book. It gives a clear and concise of the subject, and brings out ext well the salient points in connexion Roman methods of construction, pla and decoration. Some branches of tion are, furthermore, fully treated c later chapter devoted to painting and A garden scene here reproduced fro walls of Livia's Villa at Porta Prima, is a peculiarly attractive example of of fresco, and throws some light on garden design. It appears to represe wilder portion of a garden as seen ov balustrade from within the more pleasaunce. Under mosaics, as, indeed where, special attention is devot examples found in Britain.

In the domain of sculpture Rome's Greece is enormous. To Roman adm of Greek sculpture we owe the prese of many works of the great period might otherwise have perished, while were perpetuated by reproduction and tion. Again, a great part of the definitely Roman sculpture was execu Greeks. As Mr. Walters points out ever, individual Greek works were copied literally, the artists aiming ra reproducing types created by the masters or the style of some school or and allowing themselves considerable l in their interpretation.

Rome also owed much to Etruscan tion and influence. Though this probab in most cases, was an indirect debt Hellenes, this was less so in respect trait sculpture, which was practise immense vigour and success in Roma so much so, indeed, that it may be re as the Roman art *par excellence*. Etruscans had produced remarkably sepulchral effigies from very early tim the Romans themselves, with their cu keeping *imagines* or wax likenesses of d ancestors in their *atria*, were favoural posed towards portraiture. Their pr matter-of-fact character inclined then more than the idealising Greeks to t petuation of the actual features and i sion of individuals. But if realistic p likenesses are thus among the pr achievements of Roman art, that it incapable of some degree of idealisa proved by the creation of the be Antinous type. The same objective the Roman temperament also tended production of vivid *genre* scenes to greater degree than was the case w Greeks.

Mr. Walters has much that is insti to say on other aspects of the subj

ophagi and monumental reliefs, on the ntinuous" style and "illusionism," on ous branches of metalwork, on gems and ery, and his book provides a most useful mary of the views held by various *savants* hese and kindred subjects. If we have quarrel with him it is that he is too lest. We sometimes wish that he could et Riegl and Mrs. Strong, Wickhoff and ygowski, and speak with the authority hich his learning entitles him.

History of the Church of St. Giles, orthampton. By Rev. R. M. SERJEANTON, M.A., F.G.A. (Northampton: W. ark & Co. Price 7s. 6d. net.)

ood deal of architectural interest pertains wo of the old churches of the ancient ugh of Northampton, namely, those of Sepulchre and St. Peter. All Saints, central church of the town, though rebuilt r the great fire of the XVIIth century, esses a history closely linked with the ous important incidents that tell of the and religious evolution of the townsmen. story of these three churches has already successfully told by Mr. Serjeantson, in any volumes, at intervals during the last years. He has now crowned his work producing a fourth book of some 400 s, lavishly illustrated, descriptive of Giles, the last of the four old churches. pecial interest attaches to the last of e churches, for the municipal life of a ving and energetic borough centred round a remarkable extent. It was within nave or the churchyard of St. Giles the often turbulent and exciting assem- of the burghers took place, and here, the mayors, bailiffs, coroners, and other officials were elected year by year. ntually, after a disastrous election in h there was loss of life, an Act of iament was passed in 1488 whereby the chise of the burghers was considerably icted, and the elections placed in the ds of a select company known as the y-Eight. Henceforth, the annual pro- ings took place within the small Town . Churches dedicated to St. Giles stand the most part in lonely districts, and in cases where they were connected with centres of population they were usually d without the town walls. This was the with regard to St. Giles, Northampton, founded in the early Norman days. It stood on the outside of the Anglo-Nor- wall to the east of the town. When the mediæval walls were built about 1300 church was brought within the extended d area, near to the east gate of Abing- street. Mr. Serjeantson's conjecture as ne reason of the townsmen, in their aim dependence, selecting St. Giles for their ing place, rather than the central and r building of All Saints, is probably ct. This church was the farthest re- d from the overshadowing influence of royal castle on the west of the town, also equally remote from the ecclesi- al control of the powerful priory of St. ews, which stood just within the ern gates.

idents of the early municipal history of and will not be surprised to find the sfolk of Northampton using the nave church for their assemblies. Mr. Ser- son instances like usages (at Grantham at several of the Cinque Port towns), but a usage appears to have been the m up and down England rather than xception. Such instances as Cambridge, rich, and Salisbury readily come to .

. Serjeantson shows much painstaking rch in all his investigations, particularly the pedigrees and life stories of those lies which were in any special sense ected with the church and parish. He been able to add no fewer than eleven s to former lists of the vicars of St. , which he takes back to the year 1239. wo particulars he supplies special in- ation on points of far more than local est. Fairly able ecclesiologists often go g on the subject of anchorites or re- , for whose retired lives special cells not infrequently built, attached to the els, and occasionally to other parts of eval church fabrics. There was at St. an anchoress or female recluse, in XIIIth century, of the name of Eva, who obtained a considerable repute for sanctity. On this incident the writer has built up an excellent, reliable, and tersely written essay which sets forth the real facts associated with the lives and customs of such individuals.

The other point of yet wider interest is an outline life of Robert Browne, the founder of the Congregationalists or Independents This able but imperious and fickle man, after a quarter of a century of peaceful life as a beneficed priest of the Church of England, when over 80, again quarrelled with the authorities, was placed in gaol at Northampton, where he died, and was buried at St. Giles on October 6, 1633. Mr. Serjeantson has unearthed a considerable number of facts from the records at Peterborough, altogether unknown to his previous biographers.

The long chapter on the architectural history has been entrusted to the capable pen of Mr. A. Hamilton Thompson, F.S.A. The fabric, consisting of chancel with north and south chapels, central tower with transepts, clearstoried nave with south aisle, two north aisles, and north and south porches, well merits closer attention than it has hitherto received. The plan of the early Norman church was cruciform with a central tower space, and was probably aiseless. There are evidences that the south aisle has been built up against a previously-unpierced wall, and the same was presumably the case with the northern arcade. A blocked-up south door way of XIIth century, or possibly XIth century date, shows that the chancel was longer than an ordinary early Norman chancel. Restorations have renewed most of the arches of the base of the central tower, but they are known to have been distinctly Norman, and some remains of the original archway on the north side of the tower have been recently uncovered. The west and north doorways of the body of the church are also early Norman, though in both cases set back, rebuilt, and not a little renewed. As the XIIth century proceeded important alterations took place. The high square turret at the north-east corner of the tower, with newel staircase, is of massive form, and was probably intended originally to be external. The belfry doorway, with sections and mouldings, is boldly drawn by Mr. Thomas Garrett, who also supplies other architectural sketches.

At the dawn of the Gothic period the chancel was enlarged in width as well as in length, and by this proceeding the turret was brought wholly within the fabric. Two of the lancets of that period remain, and the upper part of a third. The rebuildings and enlargements of the XIVth century are next discussed and described with much lucidity, the new east wall, the transeptal chapels, the chancel chapels of different dates, and the aisles and arcades of the nave. The late XVth century and early XVIth century work was chiefly confined to enlarged windows. A record allusion to "the new work of our Lady Chapel" is of the year 1512.

About a century, however, after the completion of these last alterations there came about the disastrous fall of the central tower. The exact date of the collapse of the tower and its rebuilding are thus concisely preserved in a contemporary MS. :—

"1614, St. Giles steeple fell downe.
1616, St. Giles Church began to be reared.
1617, St. Giles Church was leaded."

The tower in its fall destroyed much of the nave. The Jacobean tower is a notable piece of construction, and presents a dignified appearance. Over the first pillar to the west of the tower is a bold piece of lettering, the rhymed effort of Dr. Sibthorpe, a celebrated Northamptonshire incumbent, who at that time held the vicarage of St. Giles :—

"Rob. Sibthorpes to God's true feare,
This downfalne church got helpe to reare.
1616, Will. Dawes, mason."

In the middle of last century a complete scheme of restoration was carried out by Mr E. F. Law, on the report of Sir Gilbert Scott, whose brother was at that time curate-in-charge. Twenty years later much money was spent on the chancel and its side chapels.

The remarkable architecture of the round church of St. Sepulchre and the profusion of late enriched Norman of St. Peter's church has always made Northampton a favourite place with architectural students. With this book of Mr. Serjeantson's in our hands it will be found that Northampton possesses a third church well worthy of close attention.

Technical Arithmetic and Geometry. By C. T. MILLIS, M.I.Mech.E. Second Edition, revised. (London: Methuen & Co., Ltd. Pp. 290. 3s. 6d.)

HAVING reviewed the first edition, we need merely point out some of the more important modifications and additions embodied in the present issue. In Chapter II. the greatly increased use of decimal fractions has been suitably recognised. The additional exercises now included should be generally appreciated by both teachers and pupils, and the addenda to the concluding chapter ought also to be found of value. As a text-book combining arithmetic, geometry, and mensuration the treatise occupies a unique position, particularly as the author never steps beyond the boundaries of an elementary course of instruction.

LEGAL COLUMN.

What is Repair?

In our Law Reports last week we reported a case heard at the West London Police Court, in which the District Surveyor contended that notice should have been given under sect. 145 of the London Building Act by contractors who were reroofing a workshop with zinc. The brickwork of the walls and the woodwork under the roof had remained untouched, but the zinc was renewed with the exception of the clips. It was contended that this work came within the exception contained in sect. 209, being "necessary repair not affecting the construction of any external or party wall," and Counsel particularly inquired how could you repair a zinc roof except by renewing it? The Magistrate accepted this view, as the main structure of the roof was untouched, and he dismissed the summons; but he commented on the difficulty of construing the London Building Act.

A case where part of the woodwork had to be renewed will be found reported, the *Builder*, July 7, 1911, where the summons was also dismissed.

Each case has necessarily to be decided on its merits, and there appears to have been no case in which any exhaustive definition of "repair" in such a connexion has been given, but the term has been considered in an endless number of cases, as between landlord and tenant, and it may be suggested that the question to be answered is—Does the operation being carried out in any way alter the nature or character of what is being renewed or repaired?

If the character of a roof, for instance, is altered it is not merely "repair," but something beyond repair; but where new material of the same nature as the old is merely replaced on a structure, which as such also retains its own character, then what is done appears simply to amount to "repair."

Trade Union Law.

Two cases of importance on the liability of trade unions to be sued in respect of their actions have recently come before the Courts. In Vacher & Sons *v.* London Society of Compositors the defendant trade union had published a libel on the plaintiffs. The libellous statements are not set out in the report of the case, but they related to the plaintiffs' trade methods, and the question to be decided was whether sect. 4 of the Trade Disputes Act applied so that the plaintiffs had no right of redress by action in a Court of law.

The decision by the Court of Appeal of this case has done little to elucidate the law on this section. The majority of the Court held that as the libel related to matters affecting trade unions and workmen, and it was published in contemplation or furtherance of a trade dispute, the section applied, and the plaintiffs' action would not lie. Lord Justice Farwell dissented from this judgment, and it is to be hoped that the case will be carried to the House of Lords. The proposition that a union can deliberately publish a libel upon members of the public without in any way being called to account in a Court of law, or being enjoined from repeating it, is one that surely cannot be tolerated in a civilised country. As Lord Justice Farwell observed, no honest trade unionist could be found to say that the publication of lies could be either necessary or expedient in the interests of his union, and the only advantage we can see from such a decision is that it emphasises

in a marked degree the absurdities to which the Trade Disputes Act lends itself.

The decision is important as it raises a question under the Act which requires revision. Sect. 4, sub-sect. 1, which grants immunity to trade unions from being sued for torts in any Court of law, is in general terms, no mention being made in this sub-section of the tort being committed "in contemplation or furtherance of a trade dispute." In this case, although the majority of the Court found that the libel was published in contemplation or furtherance of a trade dispute, it appears that they did not consider this essential to enable the union to claim the benefit of the section. This is an important question, as it enlarges the powers of the unions. There have been two decisions on this point in a Court of First Instance. In *Bussey v.* Amalgamated Society of Railway Servants the Court intimated, where a dispute was in contemplation or in existence, that a libel was within the protection of the section; but in Rickards *v.* Bartam, where the libel was unconnected with a trade dispute, the Court held it had jurisdiction to entertain the action. The Court of Appeal have by inference repealed the latter decision. The above cases will be found noted the *Builder*, December 26, 1908.

The second recent case was decided in the County Palatine of Lancashire. It was brought by three miners, Gaskell and others, against the Lancashire and Cheshire Miners' Federation. The Federation, in order to compel the plaintiffs to join the Federation, gave notice to cease work at the colliery, and in consequence the plaintiffs were discharged. The Federation set up sect. 4 of the Trade Disputes Act, and the Court held that there was a dispute in existence between union and non-union men, and that sect. 4 applied, and the Court had no jurisdiction. Other points were decided in the case, as, for instance, that the existence of rules held illegal in Osborne's case did not deprive the union of the benefit of the section. This was a struggle between union and non-union men, and the non-union men, deprived of their right to work, were held to have no remedy by reason of the Trade Disputes Act. The lesson to be learnt from the recent strikes is that it is essential to the community that men should be free to dispose of their labour as they think fit, and that compulsion should not be brought to bear upon them to compel them to join unions and federations. These federations first terrorise the men into joining them and then combine to enforce their will on Parliament and the public.

LAW REPORTS.

KING'S BENCH DIVISIONAL COURT.
(Before Justices DARLING, PICKFORD, and BANKES.)

Dellar Brothers *v.* Drury.

THIS was the appeal of Messrs. Dellar Brothers, Ltd., builders, from a decision of Mr. Horace Smith, the magistrate sitting at Westminster Police Court, under the London Building Act.

The respondent to the appeal was Mr. Drury, a Surveyor under the Act for the District of Westminster.

From a special case stated for the opinion of the High Court, it appeared that on April 5, 1911, the respondent preferred an information against Messrs. Dellar Brothers under sect. 153 of the London Building Act, alleging that they had failed to comply with a notice served upon them by the respondent under the Act. The information was heard, and the magistrate made an order upon the appellants to comply with the notice and to pay the respondent twenty-five guineas costs.

It appeared, further, that Messrs. Bipsine (1910), Ltd., were the holders of the lease of a piece of land at the rear of their works at Westminster. In February, 1911, negotiations were commenced with the Territorial Forces Association of the County of London for the erection of an iron shed on the land for the purpose of storing the Association's waggons. On March 27, the negotiations having been successfully terminated, Messrs. Dellar Brothers were asked to build the shed according to plans approved by an officer of the Association. It was admitted that the building was not in accordance with the London Building Act.

On March 28 a building notice under the Act was duly served upon the respondent by the appellants, and on March 31 a notice as to the irregularity of the building was served on the appellants by the respondent. As that notice was not complied with a summons was applied for by the respondent. On April 8 the property of the Association was brought to the shed, which was completed shortly afterwards. The shed in question was not a building which could be lawfully erected with the approval of the Act.

On April 20 the matter came before the magistrate. Then sect. 22 of the Act was read as follows:—

"There shall be exempted from so much of the provisions of the Act as relates to buildings and structures—every building, structure, or work vested in the occupation of his Majesty, either beneficially or as part of hereditary revenues; to the Crown to use in trust for the public services; also any building, structure, or work vested in and in the occupation of any department of his Majesty's Government, or to the Metropolitan Police, etc."

It was contended by the appellants that the said exemption clause applied to the said premises, or, in the alternative, the said premises were being erected for the Crown, and that because of the exemption the provisions of the Act could not apply. It was further contended that the premises were vested in and in the possession of the Territorial Association at the date of the hearing of the summons, and there was, therefore, no power in the magistrate to enforce the order.

The respondent contended (1) that the Association was not a department of his Majesty's Government, and (2) that the said premises were not "vested in" the Association within the meaning of the Act. He also contended that in the true construction of the Act the Crown was bound, at any rate, by the provisions relating to buildings and structures, and that the appellants' contentions were erroneous.

The magistrate held that the Association was not a department of the Government, and that in the circumstances the premises were vested in the Association on April 1; but that possession was not taken by them until April 22. Therefore, he made an order upon the appellants, enforcing the notice.

Appearing for the appellants, Mr. S. A. T. Rowlatt said the question was an important one to builders from many points of view. The notice served upon the appellants was in connexion with the irregularity of the building which they had erected, and as they did not comply with it the magistrate made an order that appellants should do so. If they did not, the District Council would have the authority to go in and pull the building down. At any rate, at the time the order was made the building in question, which was constructed of iron and could not possibly be said to comply with the Building Act, which required all buildings to be constructed of bricks, was vested in the Territorial Association, and, therefore, under the Crown. Therefore the question came to this: Was a building used for the purposes of the Crown and the defence of the realm liable to be pulled down summarily because it did not comply with the provisions of the London Building Act?

Mr. Justice Pickford: The first point, then, is whether this building was in the occupation of the Crown?

Mr. Rowlatt: Yes, that is one point, but there is also a question whether it comes within the exemption. Then a question also arises—whether the order was made when the builder was in possession or occupation. Supposing the Crown was having something done to its own buildings, as is happening at the Law Courts at present, the District Surveyor cannot summon the builder who is doing the work for doing anything outside the Act.

Mr. Justice Pickford: Take the new Territorial headquarters at the Duke of York's Schools?

Mr. Rowlatt: Yes. You can't summon a builder for not putting in a proper compliance as demanded by the Act in such a building as that.

Mr. Justice Bankes: Supposing the foundations only are laid, is the Crown in occupation then?

Mr. Rowlatt said he thought they could be. The Crown could employ a builder to come in on land in its occupation to build under the direction of the Crown. Proceeding, Counsel said there was one section which dealt with buildings other than of brick. That section was 82, which, in effect, was where builders were desirous of putting up an iron building which other parts of the Act made impossible, he should make application to the County Council and produce plans. If the Council were satisfied with the plans and particulars, they could give sanction to the erection of the building in writing. Therefore if a builder wished to erect a structure which was out of the ordinary run, he had to go to the Council and obtain a dispensation. In this case the builders went to the Council for that dispensation, and were told that, as the building belonged to the Crown, such sanction was not required. Yet when the Surveyor came upon the scene he that the building had been erected i vention of the Act, and served the no the appellants.

Mr. Ryde, K.C. (for the respond he hoped his friend would not bring thing which did not come within the

Mr. Rowlatt said he really thoug a quarrel between two surveyors.

Mr. Justice Bankes: It may be a of fees.

Mr. Justice Darling: Yes, I have se of that sort of thing.

Mr. Ryde said he was not disput the Territorial Association was acti servant of the Crown, and whether technically a department or a servan Crown seemed to him to be irrelev contention would be that Dellar Brot not at the time of the issuing of the the servants of the Crown so far as t ing was concerned.

Mr. Rowlatt said there was no d if this building came within the e as being within the occupation of th Messrs. Dellar Brothers came also w exemption. Even at the date of the the interests of the Crown were suff prevent a summons being obtained t proceedings, which would in effect the pulling down of the building.

Mr. Justice Pickford: Can't you lease of property and yet not be in occ

Mr. Rowlatt: Oh, yes!

His Lordship: Isn't that the case i it not a fact that the Association lease on April 5, and did not take oc until some weeks afterwards?

Mr. Rowlatt: That may be so; it on whether you draw that inference.

His Lordship: The magistrate ha that inference, and we are bound by

Mr. Justice Darling: Suppose a built a private house which did not with the London Building Act, and t went to live in it at the time of the of the summons against the build Crown would be exempt, and there builder would be exempt and could ordered to pull the house down?

Mr. Rowlatt: That is so. No suc could be made upon him. If he h mitted a minor offence against the Ac the King took possession, which involved a small fine, he could not, *facto*, be released from that. I say building cannot be ordered to be pull because of a contravention of the Building Act.

Mr. Justice Bankes: Supposing a said:—"This building is exempt, and not pull it down," can any further taken against him?

Mr. Ryde said he thought there was dealing with that.

Mr. Justice Bankes: If that is so, i that the order in this case was right, the building cannot now be touched.

Mr. Rowlatt said if Mr. Ryde wa and further steps could be taken a builder in respect of a building for the the result would be amusing, beca penalty for non-compliance of the or 40s., and 40s. per day until the build pulled down.

Mr. Justice Darling: If you pull Crown building, what are you not li

Mr. Ryde argued that it could not that a half-finished building could b in the Crown or be in its occupation.

Mr. Justice Darling said the build now vested in the Crown, and, in re Ryde said his submission was that the of the builder under the Act crystal April 5, when the summons was app and when the building was vested Association.

Counsel added that a suggestion h made that the District Surveyor was for his fees. That was not the fa Surveyor was the one who first t builders to go to the County Cou apply for sanction to build.

Mr. Justice Darling: And when th back after being told that they did r sanction because they were exempted veyor was not satisfied.

Mr. Rowlatt said he would withdr remark he had made which would give to the Surveyor. He had no do Surveyor was acting under a sense of

Delivering his judgment, Mr. Justice said in this case it was sought by the S for the District of Westminster, un Building Act, for the Metropolis, to an order made by the magistrate in to a building in the occupation of the and for the purposes connected w defence of the country. That build

put up by the appellants upon a piece of land on which it now stood, and had been found by the magistrate to have become vested in the Territorial Association on April 5, 1911. The magistrate also found that it was in the occupation of the Association a few weeks later. The summons taken out by the Surveyor was for alleged contravention of the Act, and it was taken out on April 5, but it was not heard until July 20, when the magistrate made the order upon appellants to comply with the notice. Compliance with the notice would have meant the carrying out of certain requisitions of the Act, so that the building would become as the Act directed it should be. The appellants, however, did not comply, and that being so, the order of the magistrate meant that if they did not do as the Act told them to the Council could, after having given seven days' notice of their intentions, enter with a sufficient number of workmen and do what was necessary to enforce the requisitions in the notice. But by July 20, when the order was made, there was very little use in it, for the building had become the property of the Crown, and, therefore, an order on the builder that he should comply with the Act was somewhat out of place, for it would mean that the building would have to be demolished and put up again. Such an order could not be enforced with regard to a building in the occupation of the Crown, and therefore he (his Lordship) thought it did not matter when the summons was taken out; what they had to consider was the date the order was made, and he found that on that date there was no power in the magistrate to make an order in respect of the building in question. The appeal would, therefore, be allowed, and the order struck out.

Justices Pickford and Bankes agreed.

COURT OF APPEAL.

(Before Lords Justices FARWELL and KENNEDY.)

Action against a Contractor: Simpson *v.* Wright.

IN this case the defendant, Mr. G. T. Wright, a contractor carrying on business in Leeds, appealed from a decision of Mr. Justice Channell, in Chambers, refusing to stay the action under sect. 4 of the Arbitration Act.

Mr. Tindal Atkinson, K.C., in support of the appeal, said that the plaintiff, Mr. E. O Simpson, a solicitor, purchased part of an estate near Oberford, which formerly belonged to Sir William Vavasour, together with a mansion or hall known as Hazlewood Castle. He desired to turn the Castle into a private residence for himself, and he entered into a contract with the defendant, whereby the latter contracted to make certain alterations in the premises, which had not been occupied for a considerable time, and which were in a dilapidated condition. The contract was for a lump sum of 3,950*l*., "subject to all deductions and additions." The architects were Messrs. Sidney D. Kitson and George Frederick Bowman, to whom all disputes arising between the parties were (under the terms of the contract) to be referred. By his statement of claim the plaintiff alleged that, having paid to the defendant in respect of work done on the alterations sums amounting to 3,750*l*., on April 4 the defendant forwarded to him a document which purported to be a final certificate for 451*l*., signed by Mr. Kitson, the amount being subsequently reduced by Mr. Kitson to 441*l*. Plaintiff's case was that the certificate was not issued in accordance with the contract; that in arriving at the amount the terms of the contract were wholly ignored; that the whole of the work had been remeasured and charged for on the basis of "measure and value" contract; and that no distinction had been made between the work to be paid for by a lump sum and the variations and extras. Plaintiff brought the action, claiming a declaration (1) that the contract dated October 4, 1909, was binding upon the parties; (2) that the liability of the plaintiff to pay the defendant for the work arose under the contract, and not otherwise; (3) that the defendant was not entitled as against the plaintiff to any sum under any certificates of the architects other than certificates issued in accordance with and on the basis of the terms of the contract; and (4) that the plaintiff was entitled to leave to revoke the submission to arbitration under the contract. In these circumstances the defendant took out a summons, asking that the action be stayed and the dispute referred to the arbitration of the architects, as provided for in the contract. His (Counsel's) submission was that the dispute was properly one which ought to be referred. During the course of the work the alterations were found to be so extensive that it was impossible to apply the terms of the contract—that was to say, it was impossible to take a lump sum first and then find what the variations were. Consequently the whole work had to be remeasured, and the plaintiff alleged that the architects in so acting had misconceived their duty. The best persons to judge were the architects who advised the work, and only they could say what the variations and additions were. Because the architects had taken a perfectly honest view of their duty and had already expressed a very decided opinion on the matters in dispute they ought not, he contended, to be precluded from giving an honest decision hereafter as to whether they were right or wrong in the view they formerly took.

Mr. Gore-Browne, K.C., for the respondent, contended that the action ought not in the circumstances to be stayed. Not only did the dispute involve the question of whether the whole of the work should be remeasured, but it raised a further question as to the architects' fees for remeasuring the work.

In the result their Lordships allowed the appeal, and made an order staying the action.

LONDON COUNCILS.

Barking.—Plans have been passed for Mr. C. H. R. Taylor for four houses in Hulse avenue.

Barnes.—Plans submitted by the Surveyor have been approved for making-up a portion of Madrid-road.

Foster has lodged plans for carrying out extensions to the cinematograph hall at the corner of Beckton-road and New Barn-street, Canning Town.

Willesden.—The Engineer has been directed to prepare plans and estimates of the cost of making-up part of Wotton-road.

TRADE CATALOGUES.

Messrs. Anselm, Odling, & Sons, Ltd., of 132, New North-road, London, and Exchange Wharf, Liverpool, send us a coloured leaflet illustrating the wide variety of marbles imported by them. Among work executed by the firm are the marble columns, steps, and flooring at the Oratory, Birmingham; the marble staircase and wall lining at the New Sessions House, Old Bailey; and granite front for the Union of London and Smiths Bank, Ltd.

Messrs. E. H. Shorland & Brother, Ltd., warming and ventilating engineers, Manchester, have just published a new catalogue, No. 30, of their warm-air ventilating patent Manchester grates, patent Manchester stoves with open fires, patent exhaust roof and special inlet ventilators. The catalogue is divided into three sections, on white, red, and blue paper, so as to facilitate easy reference, a few words of introduction being given at the commencement of each of the three sections. The first series of Manchester grates illustrated are those with the latest patent low-fire projecting back. These grates having no bars to interfere with the radiating properties of the fire better results are attained with this form of grate. The next series of Manchester grates illustrated are those which have bars fitted with the improved projecting back. With regard to the patent exhaust roof and inlet ventilators which are printed in the red section of the catalogue, the ventilators are made by special machinery. The patent Manchester stoves in the last section of the catalogue are now fitted with the latest patent warm-air mixing chamber, which increases the heating capacity of the stove without any additional consumption of fuel. These patent Manchester stoves are made either single or double-fronted, and with ascending or descending smoke flues, thus allowing the stove to be fixed in the most desirable position. The Manchester stoves are supplied in a variety of designs and finishes, but the internal construction is the same, irrespective of the design and finish selected. When the Manchester stoves are fixed with ascending smoke flues the smoke flues are encased in either glazed faience, or with iron outer casing with outlet in this outer ventilating casing near the ceiling level for the extraction of the vitiated air, thus forming a combined warming and extract ventilating system.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv. vi. viii. x.; Public Appointment, xvi.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B. Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than 6 p.m. on Wednesday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

Lindsey Hall, Kensington, W. Mr. Ronald P. Jones, Architect.

House at Champion-hill, S.E. Mr. G. Ll. Morris, Architect.

Business Premises, Berners-street, W. Mr. Louis A. Hayes, A.R.I.B.A., Architect.

The Palace of Man Singh, Gwalior.

The Crawford Municipal Technical Institute, Cork.

This building, which occupies the site of Arnott's Brewery, is situated in Fitton-street, or Sharman Crawford-street, as it has been renamed in honour of the donor of the site and buildings already there. The architect was Mr. Arthur Hill, B.E., F.R.I.B.A., and the contractor Mr. Samuel Hill. The building was opened in January.

COUNTRY PLANNING.

As it is only in recent years that serious attention has been devoted to the comprehensive and æsthetic anning of our cities and urban districts, is hardly a matter for surprise that our ral districts have hitherto been entirely eglected.

Yet there seems no reason why the rrangement of the country should not ceive as much attention as the arrange- ent of the towns. The opportunity r serving the needs of humanity and r adding to the amenities of life is at ast as great.

In our small island, with its over crowded population, the value of skilful planning seems obvious, and, judging from our love of country life, anything which tends to increase its charm should appeal most forcibly to the interest of the general public.

It may perhaps be anticipated that the attention which is now being paid to the towns will in time spread to the country, if only as considered in relation to the towns. It is no doubt true that, with regard to such matters as outlying suburbs, commons, and woodlands, our large cities are already establishing spheres of influence in which the general lay-out of the country, considered as the approach to the town, or as the playground of its citizens, will receive attention. But all such general ideas seem to stop at a certain point, and do not concern themselves with the country as such, or with its proper arrangement to serve the needs of those who live in it.

Most schemes at present must of necessity perhaps be conceived as patterns on a background which is left to take care of itself and to be altered or developed at the dictates of physical necessity alone, and with no regard to æsthetic considerations. Yet there would

seem to be need, and ample scope, for such considerations in every part of the country that is brought under cultivation.

There is surely an art in laying out ground, whether intended for profit or for pleasure; as much opportunity for skilful planning in the arrangement of a farm as in the arrangement of a public park. In so far as such planning adds to the beauty of the neighbourhood and to the amenities of life it may rightly be considered to rank as a fine art and to be a matter of some concern to the architect.

With the exception of the work done by the Romans this country was settled and enclosed by uncivilised people with no capital but their brains and sinews, who added field to field, taken from forest, moor, or fen, in haphazard manner to satisfy the immediate pressing needs of existence. As they left it, so, to a large extent, we see it to-day.

A detail map of any part of the country will show the fields divided up by hedges or stone walls in the most wasteful, inconvenient, and haphazard fashion that has no direct relation to modern methods of agriculture, to the convenience of the farmers, or the beauty of the landscape. We find the roads sometimes winding about in an aimless manner that has no connexion with present needs and conditions, making wide detours or climbing steep hills, it may be, to avoid swamps which no longer exist, or at other times running straight between points where direct communication is no longer necessary.

How far the dwellers in the country districts are hampered in their business or their social pursuits by bad arrangements it would be difficult to say, but it seems evident that neither the field enclosures nor the roads have kept pace with the general progress of the country.

Probably the main reason that accounts for our lack of interest in the development of the country districts in harmony with our high degree of material civilisation is the growth of industrialism, which, by drawing the country people to the towns, has shifted the centre of interest to the large centres of population. If we have failed to establish adequate road communication between these centres it is no doubt due to the introduction of railways, which altered the whole problem of planning for both town and country.

No sooner, however, do we appear to begin to make an effort to adjust our roads to the dominating position obtained by the railways than the invention of motor traction again alters the problem reinstates the country roads in their previous position of importance, and renders their improvement a matter of immediate and pressing necessity. This improvement has already been taken in hand with the help of the Road Board, but in a piecemeal fashion, and without much consideration, we fear, for the æsthetic questions involved.

However valuable may be the local improvements effected on these lines, far better results might be obtained if they were all carried out in conformity with some generally recognised principles and related to a central and comprehensive scheme.

If the ultimate problem involved is really the general lay-out of the whole country to render it even more exactly fit for the present-day needs of its inhabitants, the first essential to be considered, as in the lay-out of a town, is the proper disposition of the main traffic arteries from end to end of the country, or between the great centres of population.

When we remember that the Romans had long ago driven main high-roads across the country, many of which have since been encroached upon or allowed to fall into disuse, we cannot help wondering how far it would be possible to repair and rewiden them and bring back to them something of their former glory as the great arteries of national life.

A complete survey of their present and original condition, studied in relation to the present and probable future centres of population, would show how far it was possible to harmonise historic continuity with present-day necessity.

If the general trend of social development, as exemplified by recent legislation, leads to the division of large properties and to the return of the peasant proprietor or the smallholder, another movement is set on foot which will also tend to make this question of country planning a matter of practical politics.

Fears have been expressed that the coming of the smallholder will not improve the aspect of the countryside, that he will cut down trees, lay out the more fertile districts in small rectangular plots, each with its jerry-built shanty, and so destroy the woodlands and meadows which give so much character and charm to English scenery.

The more truth there is in this forecast the more need there is that every effort should be made to ensure by skilful arrangement and regard for the amenities that whatever old-world charm is of necessity destroyed shall be replaced by features which, in their turn, will be the delight of future generations.

Taking into account both aspects of this general question, there is little doubt that great changes may be anticipated in the near future, which if not carried out in a right spirit may ruin for many generations to come the charm of our villages and our rural districts.

But in these days of widely-diffused taste and knowledge, with an architect in every country town, there is no reason why the improvements rendered necessary either by the invention of motor traction or by changes in our system of land tenure should not be placed in the hands of those specially skilled in planning and qualified to take a broad view of the æsthetic problems involved. Neither is there any reason why a central authority should not see that all improvements are related to a general scheme and are carried out in accordance with generally accepted principles which make due provision for the amenities of life and for the charm of the countryside.

WESTMINSTER CATHEDRAL.

The mosaic work in the Shrine of the Sacred Heart is now completed. Under the vaulting, which is encrusted with gold and red vitreous mosaic, is a representation of the Sacred Face by the late Mr. W. C. Symons, and given by Mrs. Murray; in front of the statue hangs a silver lamp, designed for Sir Paston Cooper; electric-light pendants are suspended from beams at the springing of the vaulting; the walls are veneered with plates of green and white marble.

REGENT'S QUADRA

THE reopening of the q as to the unsuitability approved design for R Quadrant for the pu of the retail trader indicates that it based on a mere ephemeral dista novelty of treatment, but on a rooted conviction that if it is enfor all the prospective lessees the cl business hitherto carried on at this will be driven elsewhere and th mises diverted to such other purpo would be independent of a ma attraction to the casual passer-by.

It may be all very well to scoff uses of advertisement and to say they are inconsistent with the h forms of architectural dignity, but tisement takes various forms, and the best is the attractive display of offered to those who aim at edu themselves in what is the right an able thing to purchase. To say architecture is incapable of cater this would be, we think, an adm most injurious to the interests of th Architecture is surely an expressio need—one need may be more exalte another—but surely in an org community all legitimate need entitled to call in the aid of the arc to enhance the material expressi purpose, and for the architect to say he is out of sympathy with the pu and to persist in expressing some else places him in quite a false positi

This is substantially what has place in the case of Mr. Norman S façade in the Quadrant. No one deny to this design certain qualiti dignity and breadth, and even if think it a little out of scale with street in which it stands, this is no main point. The crux of the mat whether it does or does not expres requirements of the purpose for wh is built. Undoubtedly the popular is that it does not, and, making all a ances for conservative prejudices, are bound to say that in this cas believe that the popular view is correct one.

This places the Londoner in a dif position. There are several alterna before him in regard to the compl of the Quadrant. Shall the exi block be refronted? This can h be recommended on practical gro Shall the present building be disrega in the future work? Such a course s unthinkable—to the architect, at rate. Shall Mr. Norman Shaw's d be completed even at the cost of interests affected? After what we said, we feel that this would be a mistake, especially as there is yet an alternative open. Let us accept Shaw's building (except in regar its western bay) and set to work t if a design cannot be produced that in its general lines harmonise with block, but which will provide for all reasonable requirements of the r traders who would naturally occupy premises.

The problem is a difficult one, but we believe, insoluble, and the import of finding a means of reconcili between the interests of Lond commerce and her architectural dig

is so great that, with a view to helping towards so desirable a consummation, we have decided to institute a competition for an architectural design that, while accepting the present façade as a *fait accompli*, shall continue it in such a fashion as may not be open to the destructive criticisms that have been levelled at Mr. Norman Shaw's design.

Particulars of this competition will be found on p. 453, and we would urge our younger architects to enter, not so much for the trifling reward we are in a position to offer as for the sake of London's civic need of good architecture, and an adequate solution of one of the numerous difficulties in which, through past failures, she has become involved.

NOTES.

The British School at Rome. PARTICULARS have been published in a White Paper issued from the Privy Council Office of the Royal Charter which it is proposed to grant to the British School at Rome, to be erected on the site of the pavilion which contained the British Section of Fine Arts in the International Exhibition held last year in Rome. The Articles of the Charter are of interest and importance, setting forth the object and constitution of the School, and further reference will be made to the proposals in our next issue. The appointed members of the Council will include two appointed by the Royal Institute of British Architects, both of whom will be architects, and four by the Royal Academy of Arts, one of whom will be an architect and one a sculptor.

Port of London Competition. THE letter from Mr. C. H. B. Quennell which we publish in another column calls attention to an aspect of our method of conducting competitions which, from the point of view of their educative value, may certainly be considered a defect. The efforts of 164 competitors, many, no doubt, the ablest men in the profession, devoted to the solution of an unusually interesting and important problem, should certainly not be lost to the profession. We see no reason why the preliminary designs in a double-barrelled competition should not be retained and exhibited with the selected ones when the final award is made. This would add to the interest of the exhibition and have advantages other than educational. Considering the importance to the promoters, as well as to the profession, that the best general ideas should be chosen in a preliminary competition, there seems as much need for publicity in one case as the other. As the Port of London preliminary designs have, we believe, been returned to their owners, there may be some difficulty in exhibiting them in this case. After the final award is made, however, we hope to be able, with the assistance of the competitors, to give illustrations of some of the various ideas as to the general lay-out of the site and treatment of the building.

Another Hastings Competition. A CORRESPONDENT draws our attention to the conditions of a competition for a Sunk Area and Bandstand promoted by the County Borough of Hastings, which do not appear to be in conformity with the Institute regulations. The usual deposit of one guinea is to be retained by the Corporation, the two premiums offered are insufficient in proportion to the cost of the undertaking, and no assurance is given that the competitor placed first will be entrusted with the work. Although the President of the Institute is to be asked to nominate an assessor, it is difficult to see how he will be able to act unless these conditions are first brought into line with the Institute's requirements. Failing this, a deadlock will arise which might so easily have been avoided. As a general rule, promoters of competitions recognise the advantage of approaching the Institute in the first instance, so that the assessor may be appointed to draw up the conditions on terms which allow architects of repute to compete, so ensuring more satisfactory results to the promoters. It is, however, gratifying to note that the Corporation of Hastings fully appreciate the importance of obtaining the best available architectural skill for a class of work which, though powerfully affecting the appearance of a town, has been too often carried out without it. Once they realise that these conditions are likely to defeat their object and to be prejudicial to their own interests they will no doubt take steps to reconsider them. That an offer of premiums only amounting to a total of twenty-five guineas, while a charge of one guinea is made to each competitor, might look like an attempt to finance or even to make a profit out of the competition, would probably never occur to promoters who had no such intention.

How Many Houses to the Acre? MR. RAYMOND UNWIN, in a letter to the *Times*, points out that in limiting under a town-planning scheme the number of houses to be built on an acre of land the speculator is tempted to erect larger houses on each plot, which may come to be occupied by two or more families, thus perpetuating a state of affairs that it is one of the aims of the Town Planning Act to abolish. It is pointed out that in arranging the number of houses some consideration should be given to their size; but this appears to us to add a complication to the procedure that would render it almost unworkable. Now, why not solve the problem by simply stipulating that not more than a certain amount of cubic feet of building should be constructed per acre? This would allow the utmost freedom in erecting the class of property most nearly suited to the requirements without putting a premium on the larger house, which may become liable to misuse.

The Teaching of Design. FROM the Report of the examiners for 1911 on the selected works of schools of art and technology recognised under the regulation of the Board of Education we gather that these schools continue to be weakest where they should be strongest viz., in the art of design. Good progress is reported in work from the life and in other imitative studies, but it does not appear to be so noticeable in the application of the technical skill thus obtained to the purposes for which these schools were founded. When the examiners point out that certain designs are not up to the level of ordinary trade work, the remark, we presume, is intended as a severe criticism. But when we remember that these schools were organised for the very purpose of raising the level of ordinary trade work, the fact that it is still so low as to suggest this observation appears to constitute an even more damaging criticism on the practical utility of the whole system of education. That the examiners in architecture should deplore the lack of competent direction in the general conception of designs, and in the elements of design, is not to be wondered at, for their criticism might, we think, equally apply to our regular architectural schools from the Academy downwards. Having recognised the lack of competent teaching, the next step is to recognise the lack of competent teachers, and then to make a determined effort to provide them, even if we, like the Americans, have to bring them in from another country.

The *Titanic*. WHILE this is not the time to enter into technical questions connected with the national disaster that has befallen us in the loss of the *Titanic*, we feel impelled to offer our condolences to those whose friends are among the missing. Of the many distinguished names on this list we should draw attention to those of Mr. F. D. Millet, the eminent American painter; and Mr. Christopher Head, who, as Mayor of Chelsea, took such a keen interest in artistic matters affecting London.

A SPECIAL meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, under the Chairmanship of Professor Blomfield, A.R.A.

Mr. Guy Dawber, in the absence of the Hon. Secretary, said he had to announce, with regret, the decease of Mr. Elijah Poole, who was elected an Associate in 1869 and a Fellow in 1874, and who was placed on the retired list of Fellows in 1911.

THE NEWER RESPONSIBILITIES OF ARCHITECTS.

The Chairman explained that the object of the meeting was to resume the discussion of the papers on "The Newer Responsibilities of Architects," which were read by Mr. W. H. White and Mr. E. Greenop at the meeting on December 18, and Mr. A. Saxon Snell had been good enough to resume the subject by preparing a paper on "The Royal Institute of British Architects' Conditions of Contract: Some Points for Revision."

Mr. Snell then read his paper, of which the following is an abstract:—

"This evening I have to confine myself to certain clauses and provisions in the R.I.B.A. conditions, which directly affect our responsibilities as architects, and with so short a time at my disposal I can only deal with two points:—

(*a*) The employment of special tradesmen as sub-contractors; and (*b*) the effect of the arbitration clause.

Sub-Contracts.

The average building owner generally imagines that the building contractor is the direct employer of craftsmen in all trades. Indeed, this is implied in our conditions of contract, for we have a clause enabling the contractor to sub-let portions of the work subject to the architect's approval of the sub-contractor. As a matter of fact, we know that in modern contracts it is not unusual to sub-let carting, plastering, plumbing, slating, etc. Possibly the arrangement makes for better work, especially if the sub-contractor is himself a master craftsman. As architects, we are concerned only to know that the sub-contractor can, and will, do the work properly. We do not interfere with the financial or any other arrangement between the parties. We stipulate only that our specification and drawings shall be followed, and that the contractor shall not thereby contract himself out of his liabilities under the contract with the building owner.

In earlier times, when contracting was a fairly-paid business, and longer time was allowed for the erection of a building, friction seldom occurred, but in these days of quick building and small profits a dilatory sub-contractor may cause serious delay and inconvenience; and many contractors feel that they should have more adequate means of control, and, more especially, the power to withhold payment. On the other hand, experience teaches us that if this power is conceded it may be used for inadequate reasons, or for purposes which, from our point of view, are not legitimate.

It must be acknowledged that in Clauses 20 and 28 this matter is dealt with in a manner which meets the difficulty—almost. Indeed, it seems to hold the balance admirably between both parties. Clause 20 may be regarded as safeguarding the contractor and Clause 28 the special tradesmen. Nevertheless, the provision for direct payment to the latter by the building owner is an awkward circumstance, which may lead to unexpeced decisions in a court of law. The case of Crittall *v.* The London County Council is a case in point.

My own practice is to nominate the special tradesmen and to fix the net amount to be paid to them. They are made to understand that they can look only to the building contractor for payment, who is solely liable. On the other hand, I have a provision in the building contractor's contract that he must pay these special tradesmen in full such amounts as I may certify from time to time, and the amounts so paid are not included in any payment to him by the building owner until he (the contractor) can produce evidence that they have actually been paid.

My own limited experience leads me to believe that there is no half-way house between taking this strong line and that of leaving the contractor that full control over the special tradesmen which he exercises over his own sub-contractors, reserving to ourselves only the right of nomination and fixing the price to be paid for the work. I am not at all sure but that the latter is in all circumstances (and more especially in our interests) the better of the two methods. On the contractor's side it removes a possible grievance; and the special contractor—well, the special contractor would look after himself. He should have means of protecting himself, and, in any case, he is not obliged to accept a contract under the terms.

Arbitration.

Perhaps the most serious defect of these conditions is that the architect is reduced to the level of mere agent for the building owner. He is deprived of judicial powers. It is a position which we think "unfair to the contractor, not in the long run to the interest of the building owner, dangerous to the architect, and derogatory to the dignity of our profession."

There used to be a clear distinction in our relations to the building owner before and during the carrying out of a contract. In the first place, we were his expert advisers in determining what forms the realisation of his desires should take, and his agents in drafting these forms for the purpose of instructing the building contractor. So soon as a contract was entered into between the parties to our duties as agent to the building owner in superintending the work was added the honourable one of arbitrator upon points of dispute between him and the building contractor.

This dual position so long held by the architect has been challenged. It is an inconvenience in the eyes of a certain class of building owner and an offence to his legal advisers. On the other hand, his Majesty's judges have generally upheld it as eminently reasonable.

I have had the privilege of reading through Mr. Bryce's paper on "The Law Relating to the Architect's Certificate," and it is very interesting and instructive. But it seems to show that lawyers are obsessed with the idea of "agency" in the architect's position; and, to speak frankly, I think they will always do all they can to deprive us of those judicial functions, which, they consider, can only be exercised by members of their own profession. It is a very natural opinion, and not by any means based on selfish considerations. Their training and experience give them a better grasp of the principles of law and equity. Where, in our opinion, they fail is in their limited knowledge of the conditions under which a building is conceived and carried into execution and their failure to perceive that supervising building work is, in fact, one long arbitration.

In the carrying out of a building contract innumerable points of difference may, and, in fact, do, arise between the parties—questions as to interpretation of the drawings and specification and as to the quality of materials and workmanship. There are infinite grades of excellence in all kinds of work, and the architect has to decide from time to time whether the grade contracted for is supplied.

As to whether a certain piece of work has or has not been done is a question of fact, but as to whether is has been done properly is a matter of opinion, and, in giving his opinion, the architect is bound to exercise judgment as between the divergent views of building owner and building contractor.

Is it not absurd and unreasonable that because one party or the other is dissatisfied with the architect's judgment a specially appointed arbitrator must be called to decide between the parties? Bear in mind that the building owner selects the architect and that the contractor accepts him, and is not bound to enter into the contract if he distrusts the architect.

In the old form of contract our final certificate was given this character of an award from which there was no appeal (except on grounds of fraud or collusion) by either party. On the whole the arrangement worked well, and it certainly did prevent a good deal of contention as between building owner and building contractor.

In the present form no decision of the architect binds either party, and certainly not the final certificate. The architect is reduced to the position of mere agent to the building owner, and as such may be sued for exercising his judgment in a way which may not be indorsed by the arbitrator. In spite of this there are those who assure us that the architect who does his duty fairly and reasonably need not fear the perils of the law; but a case such as that of Lanning *v.* Davis scarcely inspires confidence in that comfortable belief.

The deeper one goes into the intricacies of these, and, indeed, all conditions of contract, the greater is the impression that we have lost sight of the fundamental relations between building owner, contractor, and architect. The failure of one party to realise the legitimate limits of his own interests leads him to make undue claims, which the other meets with counter-claims perhaps equally exaggerated.

Is there no way out of this "comedy of errors"? May not a reconsideration restatement of the fundamental rela referred to bring us back to the reaso our association and the benefits which party may rightly expect to gain there and which the others should be willi concede?

We are at the present time seekin obtain a more definite and better-recog position in the community; and it wou well to take the opportunity of consid what in fairness should be our relations the limits of our responsibilities to parties to a building contract. To a extent it is for us to determine limits. Building owners and contra alike may well ask themselves whethe economical grounds alone it is worth to quarrel. A careful examination of records of building actions affords con ing evidence that in most cases only lawyers and expert witnesses benefit. the fruits of victory are dearly boug the cost of worry and the interference the ordinary course of business."

Mr. Harrison said he was responsible for the legal side c conditions of contract of the Institute. took five years to elaborate, and he was unrepentant. He thought they were goc the time, and he did not consider they were now, although it was very probable that a law changed they might require modern Discussing the cases mentioned by Mr. Wh his paper, Mr. Harrison said that two of ought to be eliminated altogether. In the case the architect had taken upon himsel function of a speculative builder, and he hardly have expected that the result w have been different from what it was. regard to the case of Lanning, he did not thi was quite fair to say that the verdict thre would throw upon architects any new or n responsibilities at all. The case of the Leic Board of Guardians *v.* Trollope was one in ing a 100,000*l.* job, which took three yea complete. It was a job for the erection infectious hospital of nine one-story build all exactly alike. The architect had made ingenious arrangements by which the floo was to be absolutely isolated from the soil, upon the carrying out of those proceed depended the permanence of the build The architect, in his evidence, said he had attended the job ten times in the course of year, and the judge came to the conclusion he had not given sufficient supervi Evidently the clerk of works had let him There could not be said to be anything ne the case, because they all knew that it was duty of an architect to superintend the erec of his works. As to sub-contractors, functions of the architect were only to nomi or select or approve—he had nothing else t and he thought that the practice recommen by Mr. Saxon Snell in that regard was a fectly sound one. On the general questio responsibility, there was, he thought, no d that the liability of all professional men been more rigorously enforced during the twenty-five years, but it had not been alte The only professional man who had a l immunity was the barrister, and for very reasons. He did not think that immu would ever be given to members of the archi tural or other professions, and the only rem they had was to pay much more strict atten to the business side of their business. When instructions were given by telephone it always wise to get them confirmed by a let which would often be the means of sa conflict of evidence. He was afraid that most cases the person at the bottom of t trouble was the clerk of works; and their remedy was to charge a higher fee and be t own clerk of works. Until they did that he afraid they would never be rid of the incess troubles to which they were subjected. T must never forget that all professional were at the service of the public, and it wa very difficult and dangerous thing for them take any step which was not very clearly in interests of the public. They would find t there was a law that they were liable as agent of the man who employed them. such they were able to sue for their fees, they were liable to be called to account for neglect or omission in the services which t rendered their client. He was not at all that the architect did not better serve person who employed him if he did not occ

is position of arbitrator, and he had often eard it said that a builder who knew that he as in the hands of a very strict architect would ideavour to get a little bit of his own back in her ways. With regard to their conditions, ey had made a slip in Clause 30. The agreeent in 1907 was founded on two principles. ne builders said, we will come in and make a agreement on one condition—that everything referable to an ultimate and outside arbiator. That point was considered and delibeted upon most carefully by a most able mmittee, and was eventually accepted. On e other hand, the architects said, we are lling to accept that principle, but we will not relegated to the position of being a superior erk of works—we must be master of the job d master of the contractor, although we are reeable to be amenable to some outside ibunal. The point he wanted them to conder was that if they altered that the public ould say that the alteration was not being ade for their benefit or for the benefit of the ntractors, and it was, therefore, for them as chitects to decide whether in these days it ould be a wise policy to attempt to make any ange.

r. Atkin Berry,

seconding the motion, said it seemed to him at the papers scarcely justified their title. ey were supposed to be on "The Newer sponsibilities of Architects," but he could not d anything in them that was new in regard to eir responsibilities. He thought the papers ght quite properly have been called "Some the Responsibilities of Architects," or "A w Light upon the Responsibilities of Archiets." That was perhaps best illustrated in e cases which had been put forward by Mr. eenop. What he (Mr. Atkin Berry) wished emphasise was that they must not form their inion upon the bare wording of the judgents. They must put themselves in possesn of all the facts and know all the details of e evidence, because those judgments were sed upon one particular point, and unless ey gripped the exact purport of that point ey missed the true effect of the judgment. e case of Lanning *v.* Davey & Salter was a scarriage of justice from the beginning, but it s a risk which every citizen stood who might ve an unjust action brought against him. the end the final judgment was in favour of e architect. The case of the Leicester Board Guardians *v.* Trollope did put architects in very difficult position, and Mr. Harrison had t quite satisfied them as to how they could otect themselves against an action of that nd. The architect might take every possible caution to design his building and draw his cification and to direct execution of the rk, and yet, through some bit of devilry on e part of somebody else, something went ong which he had no means of discovering, d he was held liable while the builder escaped. Mr. Harrison could show them how they could otect themselves against responsibilities of at kind he would be doing them an enormous vice. The case of Roberts *v.* Hickman was e in which the architect had withheld his tificate under the influence of the building ner. It was a maxim with them that that s a most improper thing to do, and if an hitect did such a thing as that he must take e consequences. That was no new responsiity. It could not be said that that was an ire reversal of the decision in the case of bins *v.* Goddard—the two cases did not bear nparison. The case of Crittall *v.* The London unty Council gave them pause, and they had ask themselves what course an architect was take in putting the work in hand which he shed a sub-contractor to do. The course ich Mr. Snell had suggested was one which s familiar to them all, and which most of em would adopt. Mr. Snell had put in a plea greater simplicity in their conditions of ntract and for more mutual confidence ween the builder and the contractor. That s a counsel of perfection and a consumman devoutly to be wished.

r. William Woodward

d he quite agreed with Mr. Harrison and Mr. kin Berry that really there were no newer ponsibilities for architects. He believed t forty or fifty years ago the architect was responsible to his client for the proper conuction of his building as he was now, but at had undoubtedly arisen was a greater ire on the part of clients to bring into the courts those cases which forty or fifty years ago would have been settled outside. With regard to sub-contractors, he had just read a work by Mr. J. W. Smith, in which he said that their conditions of contract failed in this one important respect—that it did not give them the power to withhold payment to the general contractor until they saw the receipt from the sub-contractor. Mr. Smith had made it quite clear that he would not pay the general contractor until he was assured that the sub-contractor had been paid, but there was no power in the conditions of contract to withhold the certificate to the general contractor and say that he should not be paid until they had seen the receipt of the sub-contractor. That was a point the Institute was now dealing with, and he hoped they would find that the new conditions of contract would fairly deal with that. The case of Crittall would have been all right except that the general contractor became bankrupt before payment had been made to the sub-contractor. The sub-contractor sued the London County Council and recovered, and it was against that very great risk that they, as architects, had to try to guard themselves. With regard to the question of agency and how far an architect was able to pledge the credit of his client and how far he was empowered to add to the amount of the contract by additions for which he had not got the previous consent of his client, he claimed that, as agent of the client, the architect was empowered to order extras to any extent he liked so long as those extras were not detrimental to the building itself. On the question of arbitration, if he were a contractor he would under no circumstances sign a contract where the architect was left as sole arbitrator.

Mr. Douglas Mathews

said he must differ with Mr. Atkin Berry that there were no new responsibilities upon architects. When one considered what were the duties and responsibilities of architects forty or fifty years ago as compared with the present day he could not help saying that there were a good many new responsibilities which operated most seriously against the architect in his practice. [Mr. Atkin Berry: I did not say that there were no new responsibilities; I said in these papers.] Mr. Douglas Mathews, continuing, said that in former days builders were men who took a real interest in their work, and the architect did not have to supervise his building to anything like the same extent as he did now. At the present day, while many builders were doubtless good organisers, they were not practical men, and the architect was turned over to the manager or foreman. That in itself was a very great responsibility, because they were practically at the mercy of men who did not care twopence about their work. With regard to the position of an architect as architect, if he could not be trusted by his employer it was a very serious thing for both of them. It meant that if they had to go to an outside arbitrator for every little difference between the architect and the builder the owner was going to be pinched. The architect should be the go-between between the employee and the employer, and he should be looked upon as a man of position and a man of strict integrity, to be trusted by both parties. The architect should not be made responsible for work which he had not done.

Mr. Lovell

said the question was undoubtedly a very involved one, and to one who had, like himself, been practising abroad it was even more involved. As they were aware, the question was raised at the International Congress at Rome, and there were three distinct references to it. In one case it became apparent that in France the question of the sub-contractor practically disappeared, because in that country each trade contract was lot separately. In Italy it would appear that the architect almost became the contractor, inasmuch as he gave a price for the completed buildings. In Spain and South America generally the custom was to have two architects—one was the architect for the contractor, who did the bulk of the work of the drawings, and the other was the architect for the building owner, and between them was an arbitrator to settle any disputed questions. His idea was that it was an exceedingly difficult question to determine that the architect could be anything more than the agent for the building owner, but he thought it was only fair that there should be somebody beyond him to whom questions in dispute should be referred. He could not help feeling that the trouble lay with the clerk of works, and if that person could be supplanted by the young architect they would get a better class of man controlling the workmen, and they would be educating their young architects in a class of work which would be exceedingly valuable to them.

Mr. H. D. Searles-Wood

said he did not wish it to go out to the world that architects were trying to safeguard themselves too much. The responsibilities they were considering were their clients' responsibilities as well as their own, and that was the light in which he hoped the public would look upon the discussion; and not that they were trying to make things too easy for themselves.

Mr. Blanco White

said Mr. Woodward had raised the question as to how far the architect had authority to order variations in a building. His (the speaker's) view was that if the variation was detrimental to the building then the contractor was not obliged to obey the architect. He knew that was an idiotic answer, because in practice he did not see how a contractor could possibly be expected to say whether any particular order was detrimental to the building or not. The second question was what was the architect's position with regard to the building owner if the architect ordered a variation without first consulting the owner? If at the beginning of the job the architect made it plain that the plans were only provisional, and that other work might be found necessary, he took it that the architect would be safe, but not otherwise. As to how far the architect was liable for an action for negligence, and how far he was exempt because he was acting in the position of a quasi arbitrator, was a matter that depended upon the wording of the contract. In so far as the architect was the agent of the building owner, it was only just that he should be liable for negligence if it was his fault; but, on the other hand, if he was acting in a judicial capacity between the building owner and the contractor, he ought not to be liable, and he thought it was clear that he was not.

Mr. Alan Munby

said that most of them used some form in connexion with sub-contractors, but very often it was not acceptable either to the builder or the sub-contractor, and wrangling ensued. He thought it was very desirable if they could have some form showing exactly how far their responsibilities with regard to sub-contractors went.

Mr. G. Ernest Nield

referred to the case of Crittall *v.* The London County Council, and said it was the general practice in accepting sub-contractors' estimates to get them confirmed and make the contractor take over the liability. They should recollect that their form of contract went far beyond the Institute.

Mr. Douglas Wood

asked whether it was a fact that the builder's responsibility ceased when the final certificate was given, while the architect's responsibility continued for a period of six years? If that was so he did not consider it a fair arrangement. He was confident that no architect wished to avoid responsibility which rightly attached to him, but he knew of no other body of professional men who would be such fools as to take up a responsibility for which they were not justly liable.

Mr. Max Clarke

said that with regard to sub-contractors it appeared to him that it was quite possible for architects to guard themselves and their clients by putting in a clause in the contract that they were to see the receipts for payments to sub-contractors. He always did that himself, and he never found any difficulty in getting the receipts. After all, their responsibilities were much the same as they had always been, but they had become much more complicated and intricate as compared with thirty or forty years ago. Nowadays bricks were bad, the Portland cement was often too hot, and the steel, unless they looked very carefully after it, came from Belgium. All those things required much more careful and personal supervision, and the moral of it all was that they ought to pay four times the amount of attention to their work, and

they ought to ask their client for four times the amount of time to carry it out. They should all alter the contract with regard to employer's liability and workmen's compensation. Personally he thought they were making too much trouble for themselves with regard to the form of the contract, and not paying nearly enough attention to the carrying out of their building, and that if they talked less and did a little more they would be all the better for it.

After a few remarks from the Chairman, the vote of thanks was carried, and was acknowledged by Mr. White, Mr. Greenop, and Mr. Saxon Snell.

The Chairman announced that the next meeting will be held on Monday, 22nd inst.

SOME SCOTTISH HOUSES OF THE RENAISSANCE.

MR. GERALD C. HORSLEY (President) took the chair on Monday night at the Rooms, Tufton-street, at an ordinary meeting of the Architectural Association.

Mr. H. A. Hall (Hon. Secretary) announced that an exhibition of ½-in. scale drawings and photographs, and smoking concert, will be held on May 3. The exhibition will be opened by the President at 7.30 p.m., and the concert will commence at 8.30 p.m. The exhibition will remain open for a week.

The Elections.

A report by the scrutineers stated that 298 members voted for the election of officers, and there were four papers invalid. The officers elected for Session 1912-13 were as follows:—*President*—Gerald C. Horsley; *Vice-Presidents*—W. Curtis Green and Maurice E. Webb.

Ordinary Members of Council—Arthur T. Bolton, Cecil C. Brewer, F. C. Eden, G. Leonard Elkington, Theodore Fyfe, Stanley Hamp, Alick G. Horsnell, Geoffry Lucas, F. Winton Newman, A. Gilbert Scott, W. J. Tapper.

Hon. Treasurer—Arthur Keen.

Editor of the Architectural Association "Journal"—P. Cart de Lafontaine.

Hon. Librarian—W. H. Ward.

Hon. Secretary—Herbert A. Hall.

Votes of Thanks.

On the motion of the President, votes of thanks were accorded to the scrutineers; the retiring members of the Council (Messrs. C. Wontner Smith, Horace Field, and P. May); the professional Press; and to Messrs. Lan chester & Rickards for their kindness in allowing a party of members to visit the new Wesleyan Church House on March 30 (Sixth Spring Visit); also to Mr. E. C. Howell, the clerk of works, for conducting the party over the building.

Mr. Lawrence Weaver then gave an address on "Some Scottish Houses of the Renaissance," his remarks, which were delivered without notes of any kind, being illustrated by a large number of lantern slides. He said that the treatment of house planning in Scotland was rather different from that of England. In his book on the growth of the English house Mr. Gotch said the English house was developed from the Castle keep. He (the speaker) thought this was somewhat inaccurate, and that it would have been more accurate to say that the keep was an occasional incident owing to need of defensive operations, but that the English house grew around the hall. When they came to Scotch architecture he thought that Mr. Gotch's generalisation would be accurate, for there were very few houses in Scotland, and he himself had seen none earlier than the XVIth century, built at all on the typical hall plan. There was one rather important general point with regard to Scottish houses which was brought out by the use of a colloquialism in respect to building. Whilst in England they always referred to bricks and mortar, in Scotland they spoke of stone and lime, and with very good reason, because no bricks were used in early buildings at all. It might be a wide statement to say there were no houses built of bricks earlier than the XIXth century, but there were almost certainly none before the XVIIIth century. They had generally looked on Scottish architecture as being a somewhat limited affair, which began and ended with what was known as the baronial building, and that idea had to a large extent arisen because the literature of Scottish architecture was limited. There was one very notable book by McGibbon and Ross, but the authors were very Gothic in spirit and somewhat lacking in sympathy with the full Renaissance. They touched very slightly on the Renaissance buildings introduced by Sir Wm. Bruce, and the result was that it had been rather felt that there was nothing in Scotland except the ordinary baronial house. He proposed to show that evening that this was somewhat of a misunderstanding, and that, although there was nobody at all in Scotland to take the place of Inigo Jones and Wren, and the big men who followed them in England, yet there was a very serious school of neo-Classic architecture in Scotland started by Sir Wm. Bruce. The important dates with regard to Scotland were 1539 and 1671. The first introduction of the Renaissance in Scotland was in 1539. McGibbon and Ross did not lay great stress on the introduction of Renaissance detail, and did not attach to Sir Wm. Bruce, the King's Surveyor in Scotland during the reign of Charles II., the importance that was his due. When he (the lecturer) came to write something about Scottish houses he thought that it was important to find who actually introduced the Renaissance into Scotland, and he rather fancied he had tracked the man who was responsible. In the reigns of James IV. and James V. a very disastrous state of affairs existed in Scotland, and the habit was to try and get rid of the King at an early stage, with the result that the next king was always a minor. The usual procedure then was for the great lords to quarrel for the possession of the young King in order that they might administer the affairs of Scotland as it seemed best to them without any very special reference to the good of the country. History had a greater effect on the architecture of Scotland than elsewhere. The extreme turbulence of manners of the Scottish noblemen of the XVIth century had a great effect on Scottish architecture. Amongst these turbulent men were the Earls of Arran, and one of them, Sir James, had an illegitimate son called Hamilton of Fynnart, who became a very important person at Court. He was brought up with the young King, and no doubt had a great deal of influence with James V. Hamilton started his architectural career rather early in the XVIth century by killing a carpenter named Gavin. He went to France, and at the Court of Francis I. no doubt learned a great deal of the great change in architectural tendencies then going on. Anyhow, about 1539, when King James came back to Scotland with his second bride he was struck with the rudeness of the house in which he lived, and set about altering Falkland and Stirling Castles. The rebuilding of Falkland had been started at the end of the XVth century, and in the course of the work some French masons were introduced. One was Le Roy, and he (the speaker) had no doubt but that these men were introduced by Hamilton. At all events, they first got Renaissance treatment between 1539 and 1542. The King was killed shortly afterwards, and the new influence dropped for about fifty years. Hamilton was Master of the King's Works at Falkland and Stirling. The important point was that in 1539 he was appointed Surveyor generally of all the King's palaces in Scotland, which was a way of showing that Hamilton had done something special in the way of building and had introduced a new into Scottish architecture. Unfortunate account of his habit of bickering they ex him, and so the Renaissance stopped time. It was interesting to notice that was nothing of any importance in Renai building at all from 1541, when Hamilto executed, for about another sixty years, regard to planning, the military el continued very steadily in all Scotch h and the only place where it was softened in the XVIth century w Falkland, which was built as a huntin The defensive idea became an obsessi the minds of Scottish house-builders, an would be seen by the plan shown on the of Scots Tarbet Castle, in Fife. One suppose it was a house built for a warlike tain, but it was built for Sir John Scot was not a person violent by nature or

Sir John Scott had travelled a good abroad, and he prepared a survey of several Scottish counties and went to Amsterdam saw it through the press. The house wa soon after 1620, only a few years befo Banqueting Hall at Whitehall was built. that plan before them built at such a dat would realise that they could not expect an very elaborate in the way of Scottish planning, nor did they get it. Mr. Weave showed the plan of Hatton House, a few east of Edinburgh; this being the house Bothwell lay the night before he abducted Queen of Scots. Up to about 1670 the lands lived in the house, which did not much degree of comfort, but later it was to. Winton Castle was said to have been by Inigo Jones, which was obviously a Kellie Castle was built about 1580, and again they saw the typical L-shaped Sc tower plan. When they remembered was being done in England at the same they would see how simple it was. Fa Palace was the most elaborate plan XVth century. Mr. Weaver showed the tion of the Great Hall which Mr. John K had traced when carrying out work fo Marquis of Bute at the Palace. At House they again saw the ordinary L-s tower. The Earl of Dunfermline was responsible for the new government ar ments when King James came to Lo and evidently having been brought contact with the great nobles of En who were then building stately house went back to Scotland and added con ably to the house. He built a galle the upper floor, with a painted ceiling. and the Earlshall galleries were the firs in a Scottish house. From 1600 to 1630 E influence became somewhat marked in Sco but not to any extraordinary extent. Hol Palace was more typical of the late X century. When Sir Wm. Bruce, in 1671, s to make it a suitable house for Charles very wisely repeated the old Scottish and filled in with the usual Palladian pla A view of the garden plan of the house of Si Bruce in Fife was shown, the vista dow central garden being closed by the Bass R a most effective close. Kinross House large Palladian house built, it was sa Sir Wm. Bruce on the chance that the D York would not succeed to the throne. an the house would be bought for him. Ho the Duke did succeed, and Bruce himself in the house. Dalkeith Palace had be altered that the plan was a little diffic follow. At the end of the XVIIth cen large part was added, it was said, by Vanb but it was obviously the work of Mr. Smith, who followed Sir Wm. Bruce. lecturer next showed a number of views exteriors of various houses, and also so the principal features of the interior decora In the inner court of the north side of Fa Palace they saw the first touch of Renai work in Scotland by Hamilton, and were very typical French roundels of James V. and his wife. This was done be 1539 and 1542. The other side of the was not touched by Hamilton, and the but shown were extremely rare in Scotland a period. The chapel screen was added 1620. Falkland had been most adm restored by the Marquis of Bute, but h Weaver) attributed the excellence of the to Mr. Kinross, the architect. There w particular Renaissance detail about S Castle, but on one side it could be seen the masons imported by Hamilton beginning to have effect. They saw the shafts carrying figures. It was

fortunate thing that Stirling Castle had been mutilated in the XIXth century, but now it l been taken over by H.M. Office of Works ey could be sure that no further mischief uld be done. Kellie Castle had had the good tune to be restored by Sir Robert Lorimer, ose father had taken a long lease of it. nderave, in the Highlands, had a delightful ver, which Sir R. Lorimer had restored, and e they got dog-tooth, which was dated 94, and which disturbed all one read in text-books. Earlshall, which was altered rtly after the union of the two kingdoms, wed a long gallery with a painted wooden ling which clearly came from England. It had n admirably restored by Sir Robert Lorimer. photograph of the plaster ceiling in the Vine- m at Kellie Castle was shown, which Mr. aver thought was of about 1620. Scotch sterwork was particularly fine after 1610, en he expected they imported a number plasterers from England. Traquair had the at merit of not having been restored by ybody. All Scotch designers seemed to have ned at height, which was more or less the essary outcome of the tower plans they lowed. Craigievar was, on the whole, the st impressive tower house in Scotland, and l been most wonderfully preserved. The ners had always been very conservative, l had added nothing. At the place there was hing more modern than an XVIIIth-century een. The house had seven stories. The only eration was that the windows had been slightly arged. Photographs of the fireplace in the at Hall and some of the beautiful plasterwork re shown. At Pinkie a Jacobean fountain was cted about 1618, very much like the one at mbridge. The painted gallery, he imagined, s done by an Italian artist. Winton was ite one of the finest things in Scotland. He l found in the manuscripts of the Winton ily the diary of the Earl of Winton who ered it. It was the work of George Wallace, naster mason, who afterwards started Heriot's spital at Edinburgh. Amongst the manu- ipts were all the accounts for the slaters and penters and so on. None of the men employed the work seemed to have been English, and erefore, although people said Winton was the come of English influence, there was nothing the accounts to support the view. The rl of Winton of that day, however, went to ndon a good deal, and there was an entry of paying a man *l.* to show him round the bey. Some of the ornaments on the ceilings Winton were the same as at Pinkie House, l he thought it was clear that John White l the work at both places. Glamis had been nsiderably added to. There was some fine sterwork, rather more advanced in design an a good deal of the other work at the time, ne of which was extremely barbarous. Bal- res House had been hopelessly spoilt. The dens were probably laid out early in the /IIth century, and, so far as was known, lowed the same design now. Cawdor was a rking mediæval building. It gave a romantic es of the defensive precautions adopted by builders, and it was a very fortunate thing t it had continued unaltered in large measure this day. The mantelpiece was dated 1667, and seemed incredible that such work could have en done at that time, seeing what was being ne in other places at that date. The garden neme at Drummond Castle was also illus- ted. Thirlestane was built or largely ered about 1670 by the Earl of Lauderdale, d there was an interesting correspondence isting between the Earl and Sir Wm. Bruce, d also some correspondence with the clerk works. The Earl took great interest in the rk, and sent some notes and drawings to clerk of works, and also some tobacco, d asked him to sit down and smoke his pipe d think how he could carry out the Earl's shes. He had noticed that Mr. Starkie rdner, in his book on "Ironwork," was zzled about the iron gates at Ham House. om the correspondence he had referred to seemed that the Earl of Lauderdale was very endly with the lady who lived at Ham House. d that Bruce designed the gates for her. dcaskie was Bruce's own house. Bruce was id to have been the emissary between General nk and Charles II., and after the Restora- on Charles gave him the office of Clerk of lls, which had to do with the Excise and stoms, and apparently a good deal of money ick to Bruce's fingers. He was also a King's ssenger, and apparently did not start archi- ture till about 1665, when he either built is house from the ground or built it round an earlier keep. There was no particular evidence to support the latter view. Bruce must have been doing something in the way of architecture between 1660 and 1670, because he went to Holland to buy mantelpieces for the Earl of Lauderdale, and when Lauderdale realised that it was necessary that Holyrood Palace should be rebuilt he got Charles II. to sign a warrant in favour of Sir Wm. Bruce. It had been said that Holyrood was designed by Milne. There were no fewer than eleven Milnes who held important posts as the King's Master Mason and so on. What Bruce's training may have been he had no idea. One of the Milnes prepared a scheme for the rebuilding of Holyrood, and it had been suggested that one of the Milnes was the real architect. From the correspondence, however, between Lauderdale and the King there seemed no doubt that Bruce did spend a great deal of time in preparing the plans for the rebuilding of Holyrood, and that he did really get the job on those plans. If Balcaskie was designed by Bruce, it must have been the first thing he did, and it must have been between 1665 and 1670. It still showed a devotion to the ordinary sort of Scottish tradition, and had none of the fuller Renaissance manner which appeared in Holyrood and later in Kinross. Passing to Caroline Park, near Edinburgh, Mr. Weaver said they were the most attractive roofs he knew of in Scotland. They were very small purple slates. It was said to have been designed by Sir Wm. Bruce, but there was no evidence of it. It was built about 1686. There was an extremely fine ironwork railing to the new staircase, and the ceiling, done about 1690, was probably by the same English plasterers who worked at Holyrood. The house belonged to the Duke of Buccleuch, but was now used as the office of a firm of ink merchants, who, however, took great pride in it and kept it in fine order. Drumlanrig was built for the Duke of Queensberry, and was of typically Scotch treatment. The men who did the stone carving afterwards went on to Kinross. Some were Dutchmen and some Scots. At Holyrood the ceiling at the top of the great staircase was done by English workmen between 1671 and 1679. The Office of Works had now cleared out a lot of the Victorian stuff put in sixty years or so ago, and had tried to make the Palace somewhat like it was before. Kinross House was started in 1685 and finished about 1691. It was near here that the Adam brothers were born. The vista from the Fish Gate of the gardens ended with the castle on the island in Loch Leven, where Queen Mary passed nearly a year in prison. The staircase at Kinross House was the only one of the kind he knew of at Scotland. Melville House was attributed to Bruce, and also to James Smith, "one of the most experienced architects in Scotland," as Colin Campbell called him. It was a dull house, but the inside was rather good. Dalkeith Palace he was satisfied was built by James Smith, and inside there was some carving which he did not hesitate to say was by Grinling Gibbons. New Hailes House, just outside Musselburgh, was built about 1720, and was of interest apart from architecture by the fact that it was in the library that Lord Hailes advised Boswell to pursue Johnson's acquaintance, which resulted in Boswell's "Life of Johnson." Whether the house was designed by Wm. Adam or not he did not know, but it was not very attractive. Drum House, near Edinburgh, was the authentic work of Wm. Adam. It was interesting, but he was not enthusiastic about it. Gosford House owed its existence to the game of golf. Lord Wemyss ordered Robert Adam to come up and build the house so that he might avoid having to go 6 miles to play the game; but the house proved so damp that no one lived in it for eighty years, and then Young was called in and altered it a great deal. In conclusion, Mr. Weaver showed several modern houses designed by Sir Robert Lorimer, and also a house built in Fife by Mr. Frank Deas, which has a most curious planning to meet the wishes of the occupier.

The lecturer hoped that his audience would not pin him to the exact years of the dates he had given, as it was difficult to carry precise figures in the memory. He believed, however, that they were correct enough for the purposes of the argument.

Mr. L. Guthrie

said he rather thought the garden at Drumlanrig was modern. He was told by an old gardener that a great deal of it was copied from a Paisley shawl which Queen Victoria gave to the Duchess of Buccleuch. He saw Kinross many years ago before the garden was laid out and now, and agreed with Mr. Weaver that it was a pity the summer-house had been moved. He was glad they had been shown some modern examples of Scotch houses, because there was no doubt that the best spirit of Scottish Renaissance was still carried on by a few architects, who knew what they were doing and seemed to be inspired by the romance they found in old examples. Mr. Weaver had rather "slanged" the barbarous work found in Scotland, but it was explained by the difficult circumstances under which the work was done. He was amused at Mr. Deas' house, and it reminded him of a house built by a painter of the Glasgow school, who had peculiar views on diet. He built a little hen-house outside the kitchen range, and at the back of the range there was an opening through which he could put his hand to get an egg. Unfortunately, the house was never finished.

Mr. W. H. Ward

said he had been under the impression that there was a good deal of XVIth-century work in Scotland, and he would like to know if there was no other Renaissance work of the XVIth century beyond the few examples which had been shown. There was a general impression in Scotland that Scotch Renaissance was derived direct from France, and, as they all knew, the political connexion between Scotland and France up to the end of the XVIth century was a very strong one. During the fifty years that Mr. Weaver said there was no Renaissance work in Scotland Mary of Guise and Mary Stuart were in close intercourse, whilst another fact was that a number of Renaissance houses around Aire and Dumfries seemed to suggest French influence.

Mr. A. T. Bolton

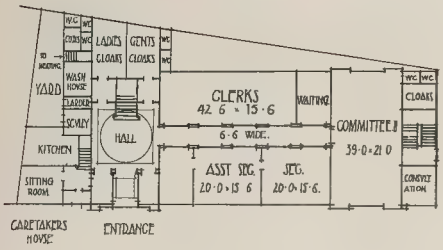
said that they could not expect anything other than what Mr. Weaver had told them of Renaissance work in Scotland when they considered the disturbed state of affairs at the period which made architectural pursuits practically impossible. They knew that in the North of England they had the Peel Castle, which corresponded to the same condition of affairs, and it was curious that that type of Peel Castle, which was the military introduction of the block-house employed in the South African War, seemed to have come south as far as Woollaton. He had seen Heriot's Hospital, but was told that it had been so altered as no longer to give one a good idea of the work. He must say that Holyrood Palace was disappointing from the Palladian point of view, but the ceilings inside were of most delightful plasterwork. Similar work existed in Kilmainham Hospital in Ireland. Architectural interest in Scotland began, one might say, with the Adams, and Robert Adam, the cleverest of the four brothers, did some extraordinarily interesting buildings. There was always something about his work which impressed one.

Mr. Curtis Green

remarked that he knew little of Scottish architecture beyond having had glimpses of it at various places. He, like Mr. Ward, was surprised that there was so little of the French influence in the examples which had been shown them.

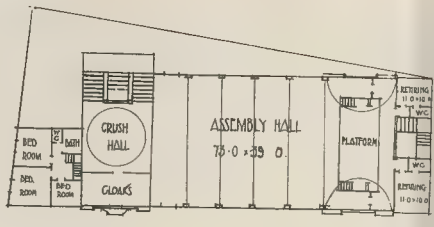
Mr. C. C. Brewer

asked what was the date of the introduction of the sash-window into Scotland, and if the samples shown in the photographs were introduced at a later date. He further observed that he had heard that the name was derived from the Dutch word for sluice.



Mr. H. W. Brittan

observed that Mr. Weaver had thrown some light on an interesting historical matter in regard to the Restoration. He had told them that Bruce was the emissary between Charles and General Monk, and this explained how it was that Monk was able to leave Scotland for Dover and time his arrival exactly with that of Charles.



The vote of thanks having been heartily agreed to,

Mr. Weaver,

in reply, said he went up to Scotland with the strong feeling that he would find a great deal of

By Messrs. Bradshaw, Gass, & Hope.

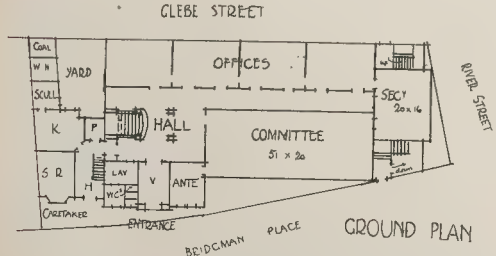
definitely French work in some of the earlier things, but the more he saw the less he felt that the French interest was very great. The outstanding fact was that the Renaissance did reach Scotland direct from France, but there was not as much definite French detail as one might expect. When they got to 1603, and James VI. came down to England and brought many Scotch people with him, they began to see the effect of English ideas, and from that time onwards it was only to be expected the influence was English rather than French. He agreed that Heriot's Hospital had been much altered, and also that there was an immense interest about Adams' houses. The photographs he had shown were merely the spoils of one visit to Scotland, and he had since had photographs taken of a great many other houses, which included several by Wm. Adam. The whole question of sash-windows was one which should be further inquired into. He had no reason to suppose they were introduced into Scotland until Bruce's time. In the Lauderdale correspondence there was an interesting note about his going to Germany about 1670 to get joiners to work at Ham House, and he did not suppose they were generally introduced into Scotland until the XVIIIth century. He had read the diary of an old Baptist minister, who said that there was only one house in Chichester with sash-windows at the beginning of the XVIIIth century.

MINERS' HALL COMPETITION, BOLTON.

As we announced in our last week's issue, the result of the competition for hall and offices for the Lancashire and Cheshire Miners' Federation at Bolton is as follows :—

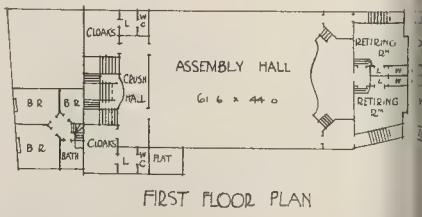
First premium, Messrs. Bradshaw, Gass, & Hope, of Bolton; second premium, Messrs. Sykes & Evans, of Manchester; third premium, Messrs. T. E. Smith & Sons, of Bolton.

Mr. Jonathan Simpson, F.R.I.B.A., of Bolton, was the assessor. The competition was limited to architects in practice within 30 miles of Bolton, and, as this area includes both Liverpool and Manchester, as well as most of the large Lancashire towns, it is not surprising that forty-five sets of designs were submitted.



The requirements set forth in the conditions were very straightforward. The offices of the Federation were to be placed on the ground floor, and were to consist of entrance-hall, clerks' offices, rooms for the Secretary and Assistant Secretary, a large committee-room and anteroom, and staff lavatory. The large hall, to accommodate about 450, was to occupy the first floor, and there were to be provided the necessary retiring-rooms behind the platform, and cloakrooms and lavatories for the public. A caretaker's house and yard was also required. As no special difficulty was presented by the site either in respect of its shape or its levels, there being a good frontage on one side to a fine main road opposite an open space of fair size, and streets on two other sides, the competition was one in which a special standard of excellence in planning might be expected, and such an expectation is amply justified by the result. In a competition only limited geographically it is a relief to find an absence of those tortured intricacies which too often pass for clever planning—the evidence of desperate efforts to squeeze in all the devices the competitor can think of. Instead, there is a high standard of clear and sane planning, and if the number of centre lines drawn on the plans were any indication of the direction of competitors' efforts, we should deduce laudable leanings towards axial planning.

There does not appear to be much divergence of opinion as to the general lines to be followed; indeed, the simplicity of the problem hardly allowed for it. The fact that the plans submitted may, broadly speaking, be divided into two distinct types is due to the one point of vagueness in the conditions. It was left for architects to decide whether the office and hall entrances should be common or separate. As all the premiated designs are based on the former alternative, it is clear that there was a distinct preference on the assessor's part for this arrangement, in which the Committee presumably shared. The point is entirely one of organisation, and it is unfortunate that the Committee did not give an indication of their preference in response to the questions asked by competitors. Quite a large number of plans based on the other alternative were of equal merit to the second and third premiated designs.



The assessor's award of the first premium to Messrs. Bradshaw, Gass, & Hope is unquestionably the right one, and we congratulate the Federation on the splendid workmanship of the plan they have obtained. Among many excellent schemes submitted this one is super-excellent. It is high praise to say that where any point of utilitarian requirement is set up the authors have met it adequately, and have added to their good working arrangement a real sense of breadth and dignity, but such praise is amply justified. We may point to the simplicity of the entrance-hall and staircase, the cloakrooms and the retiring-rooms behind the platform, and the arrangement of the offices and committee-room, and had the competition been one for the caretaker's house this firm would still have taken the premium. There is the appearance of ease in planning which always evidences greater study than the strange devices that complicate other schemes. The plan is rhythmical from one end to the other. There is scarcely a wall that does not fall naturally upon the axial framework, and convenience is sacrificed to that end. Rather does it appear that the lucidity of the plan is largely due to this principle, and, in addition, it gives a sense of scale and symmetry unusual in so small a building.

We turned to the elevations with expectation raised high. With so much architecture already achieved in the plan, we looked for its continuation in the façade. We would compliment the authors on the composition they have produced. It is sane, dignified and logical; there is an absence of meretricious detail. When we say our expectations were disappointed we do but point out a compliment. The authors show that they are of the few who might have reached the highest, and when a little more purity of style and a little more sincerity in expression the plan is all that is missing we experience a disappointment that would not occur to our minds if we had found ourselves dealing with the usual order of mediocrity.

The second premiated design is very able and in some respects not much inferior to the first. But we feel that the authors have started out with an initial mistake by placing

the building parallel to the small, unimportant street at the rear. This would ruin the main street line, and the building askew with the sweep of the building line would give the beholder a nasty jerk as he followed the direction of the adjoining frontages, and would suggest that the building did not fit its site. But for the obvious preference for a common entrance to the hall and offices a few other designs submitted should have been placed before this and the third premiated design. The axes of the crush space and the assembly-hall are at variance, and this would produce results as unfortunate in execution as on paper. We would commend the excellent working arrangement of the plan. The cloakrooms are well considered, the offices well lighted and conveniently planned; and here again the caretaker's house has received more than cursory attention. The elevations are a fair example of that weak variety of English Classic which discards the attached column, but has not the courage for plain wall surfaces, and so adopts in its place an expressionless type of pilaster, treated at the top with a species of antæ cap, from which droop two or three layers of the familiar 'apron.' The draughtsmanship of this set is very good.

The third premiated design, while direct in its arrangement, has no outstanding feature of excellence to justify its position. The arrangement of the staircase is not unlike that of the winning scheme, and the author has adopted a similar position for his committee-room, but the cloakroom arrangements are not good, and the exits from the platform end of the hall and the approaches to the retiring-rooms are clumsy. The elevations are more serious in aim than those of the second design, but do not reach to more than an average standard of merit.

One feature of great interest in this competition is the variety of cube-saving devices in the sections of the hall. Great skill is in many cases displayed in designing a ceiling which shall be high inside and at the same time low in measurement for cube, nearly always involving the adoption of means that would be more expensive than 4 ft. or 5 ft. of additional height in the hall.

GENERAL NEWS.

The Ideal Home Exhibition.

The Ideal Home Exhibition at Olympia was opened on the 12th inst. by Princess Alexander of Teck. The Princess was conducted by Mr. Wareham Smith and Mr. F. E. Bussey (Organising Secretary) through the Exhibition. The ideal house, which is the central feature of the main hall, was visited, the Dutch village was explored, and a tour was made of the Arts and Crafts Section and of that devoted to modern European furniture. Here rooms or portions of rooms are to be seen, furnished and decorated after the distinctive fashions of France, Holland, Belgium, and England. A visit was also paid to the Indian House. In the various sections in the main hall are nearly 200 stalls, and the exhibits are grouped as follows:—Furnishing, hygiene and cleaning, music and recreation, sanitation and ventilation, construction and decoration, heating and lighting, food and cookery. An article on the Exhibition will be given in our next issue.

The G.P.O. Arts Club.

The annual exhibition of the G.P.O. Arts Club will be opened on Tuesday next by the Assistant Postmaster-General, Captain Cecil Norton, M.P. The exhibition is to be held on the ground floor of the old General Post Office in St. Martin's le Grand, and will remain open for a fortnight.

Structural Mechanics.

A course of instruction on this subject is to be given by Mr. Percy J. Waldram, M.S.I., at the London County Council Central School of Arts and Crafts on Thursday evenings from 7 p.m. to 9 p.m., beginning on April 25. This course has been specially designed in preparation for the Intrance Examination, Intermediate, and Final of the R.I.B.A. Applications for admission to the class should be made to the Secretary at the School.

Ghent Exhibition, 1913.

This Exhibition will be held next year in the Park in conjunction with the quinquennial flower show of the Royal Society of Agriculture and Botany. There will be as many as twenty-seven "Palaces of Industry," all side-shows being excluded. India, Canada, New Zealand, the United States, Germany, France, Italy, Greece, Japan, and China will be officially represented, and an invitation has been addressed to the Exhibition Branch of the Board of Trade to organise a British Section. The London offices are at No. 1, Southampton-row, W.C.

Latin-British Exhibition, Shepherd's Bush.

The foreign exhibits will be contributed this year by France, Italy, Spain, Portugal, and the South American Republics, as representing the Latin races. The French Section of pictures and sculpture is under the administration of the Department of the Minister of Fine Art; a Fine Art Committee for the British Section includes Mr. J. J. Shannon, R.A. (Chairman), Mr. Lionel Cust, Mr. D. O'Brien, P.R.H.A., Mr. W. Orpen, A.R.A., and Sir F. Powell, P.R.S.W.; and, as a Sub-Committee for Sculpture, Sir G. Frampton, R.A., Mr. W. S. Frith, Sir W. Goscombe John, R.A., Mr. F. W. Pomeroy, A.R.A., Mr. W. Reynolds-Stephens, and Mr. J. Havard Thomas.

Pompeii.

Professor Spinazzola is proceeding with his excavations in the thoroughfare known as the Street of Abundance, leading from the Forum to the Amphitheatre. He has uncovered the house near the Nola Gate, and seven houses with balconies, one of the balconies having a decoration of spiral columns. The house walls are plastered and stuccoed, and beautified with frescoes; on the street fronts are inscriptions with notices relating to municipal elections—Smyrina and Asellina advocate the election as duumvir of Pollius Fuscus. Close at hand have been found a wineshop in excellent preservation, with vessels, jars, bottles, etc., and cashbox, and its sign, in fresco, of amphoras and wine-jars, and a temple with a frieze of the Cerealia.

Memorials in France to Queen Victoria and King Edward VII.

The memorial statue of Queen Victoria at Nice unveiled on April 12 is the work of M. Maubert, a student of the Ecole des Beaux-Arts, and a pupil of M. Denys Puech. He was the sculptor of the Gambetta monument at Nice, and twelve years ago exhibited his first important work—"Nuit de Noël"—in the Salon. The subsidiary figures are emblematical of the towns of Nice, Mentone, Cannes, and Grasse. M. Puech, who sculptured the memorial to King Edward VII. at Cannes, inaugurated on April 13, studied in the free art school of the Ste Geneviève Library and the Ecole des Beaux-Arts; in 1884 he won the Prix de Rome, and a medal at the Salon for his bust of Mlle. Sangalli. He was the sculptor of "La Seine" (1887), of the Leconte de L'Isle, Sainte-Beuve, and Jules Simon memorial busts, and of "La Pensée," "La Sirène," "La Muse d'André Chénier," and portrait busts of M. Loubet and Mlle. Bartel.

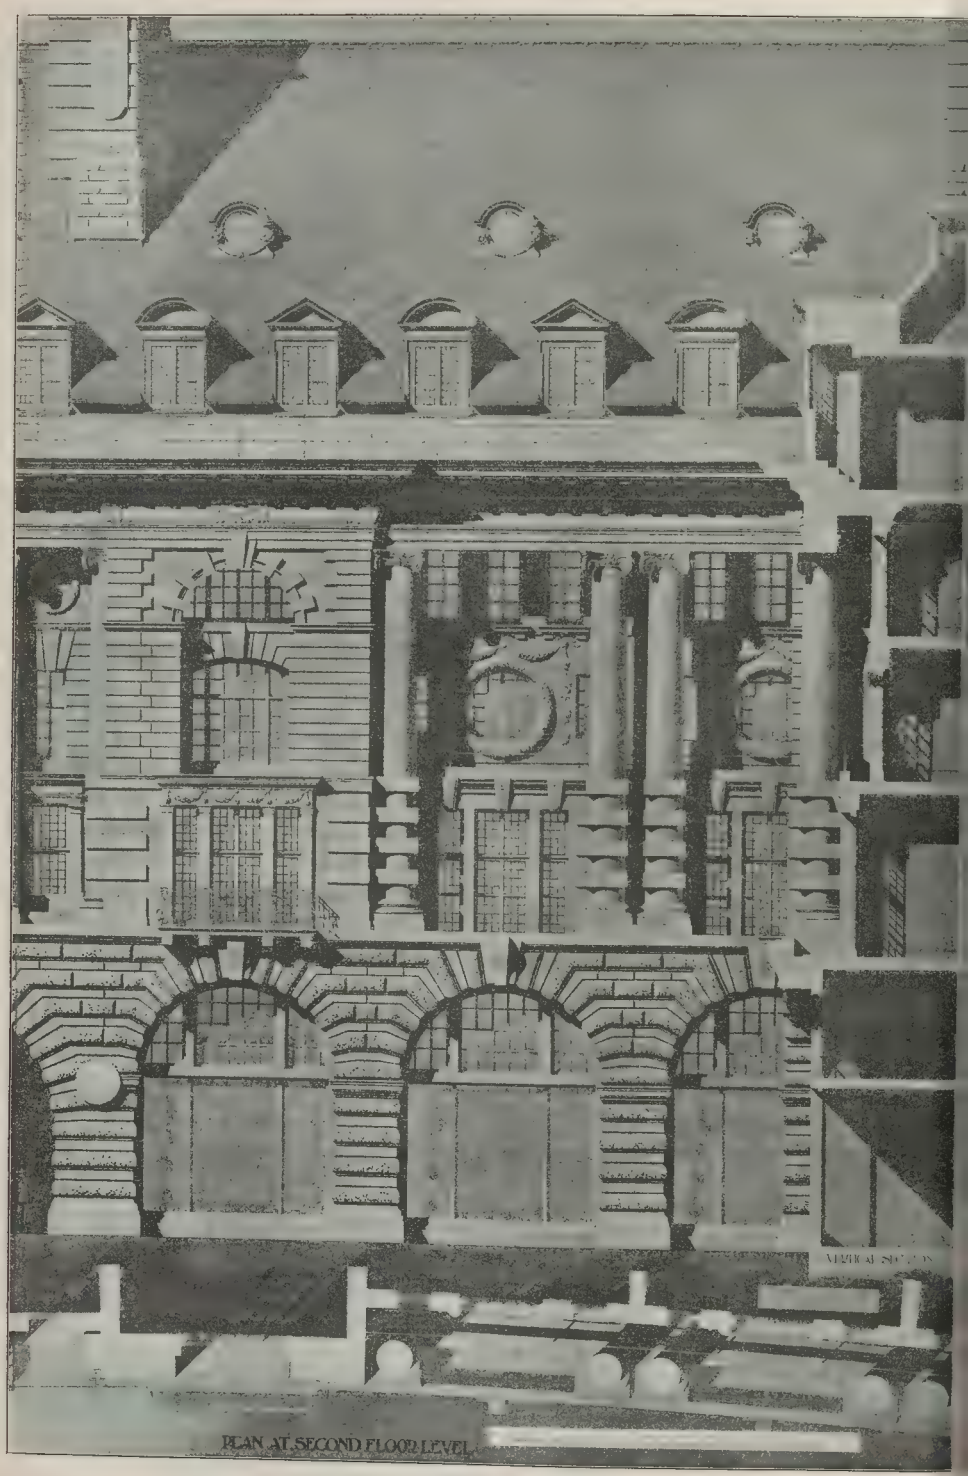
New Government Offices, Whitehall-gardens.

The property which the Office of Works propose to take for new offices of the Board of Trade and other Departments is bounded by Victoria-embankment (east), Whitehall-gardens (west), Horse Guards-avenue (north), and the grounds of Montagu House (south). It consists of the six terrace-houses of Whitehall-gardens, and of the block, to the north, of buildings now occupied by the Board of Trade. That block comprises Pembroke or Harrington, Malmesbury, and Cromwell Houses. In the stone-built basement of Cromwell House are four bays, in two aisles, of the vaulted crypt of the Wine Cellar next west to the Great Hall of York Place, which Wolsey ceded to Henry VIII. in 1529-30; one shield in a spandrel of the doorway bears, *per pale*, the Cardinal's own coat-arms, and those formerly borne by the See of York, as on a boss in the vaulting of Christchurch Gate, Canterbury (1517). Malmesbury House was built, and, it appears, in 1722—the date of a cast-lead cistern in the basement with the initial letters J. H. B.—upon the site of the "organ builder's workhouse," the workshop of Bernard Schmidt, and his son-in-law and successor, Christopher Schreider. In 1788 it was leased to James Harris, first Earl of Malmesbury. Colin Campbell built Pembroke House (illustrated in his "Vitruvius Britannicus") for Lord Herbert, afterwards Earl of Pembroke and Montgomery, who in 1744 obtained a new lease and took in part of Queen Mary's-terrace; in 1838 Robert, Earl of Pembroke, granted a sub-lease to Charles, fourth Earl of Harrington. The decorations and fittings are very handsome; the principal rooms have mahogany double doors. In the garden, extended by the construction of Victoria-embankment, is the old boathouse. Nos. 1-6, Whitehall-gardens were begun in 1806 on the site of the Queen's wardrobe, Mr. Chiffinch's rooms, the apartments of the Countess of Suffolk, the Earl of Bath, and the Maids of Honour, and part of the King's lodgings, in the old palace; the former river wall marked the line of Queen Mary's "terras walk," or "little garden," which absorbed the Privy Stairs, No. 4 was built in or about 1824 by Sir Robert Smirke for Sir Robert Peel, who died there on July 2, 1850. Lord Beaconsfield lived in No. 2 in and after 1873. The several buildings we mention cover a considerable portion of the XVIIth-century palace as plotted in detail in Fisher's plan of about 1670, and it is proposed to give to the London Museum the relics and other antiquities that may be discovered.

CORRESPONDENCE.

"The Ideal Builder."

SIR,—Your very interesting article under this heading must have given rise to reminiscent thought in many of your numerous readers who have had practical experience in the work of carrying out and supervising large building undertakings.



Every completed building is the combined expression, so to speak, of the architect, the builder, and the clerk of works, each of these men playing his part, the personal element or ego in each one of them being the dominating and determining factor which makes for success or failure in the product of their combined labours, the happiest results being attained where these three can work co-operatively and harmoniously—alas, not always the case!

Most architects of a large practice soon find out the builder (or builders) who comes nearest (or *vice versâ*) the ideal builder—the one who gives least trouble, who is in sympathy with his work, and who is "straight" and businesslike in his dealings. To such he naturally gives the preference; for, of all men, the architect's mind needs to be somewhat free of one job while projecting another, and a job once in the hands of a reputable builder and a competent clerk of works should give him little further trouble.

The builder of to-day is a builder by choice or circumstances—not for the purpose of building, but for the purpose of making profits. This is the one central idea and thought to which all others converge in the maintenance and transacting of his business. And around him are the various merchants and sub-contractors who supply him with material and labour for his undertakings, each and all imbued with the same thought and feeling, and who without which would soon be driven to the wall by the mere force of recognised economic conditions. By the man supervising building works this should never be lost sight of in the interest of the client and the contractor alike—especially of the client—for it is here more than anywhere during the progress of and at the completion of the works that the personal element or factor shows itself.

To one contractor a proposed building may be as a sponge from which every particle of financial moisture shall be squeezed; to another an undertaking which shall yield an adequate profit and credit to all concerned. But this can only be settled by the ethics of pricing, for cheap and nasty holds nowhere more true than in building; and the two men represented above are types of the ideal and the unideal builder.

But we must remember that most under-

Detail Elevation for Part of Regent's Quadrant.
Mr. R. Norman Shaw, R.A., Architect.

kings to-day are not actually carried out the parties to the contract, but by their presentatives—the builder's foreman and architect's clerk of works. How often do see the advertising foreman describing nself in the columns of the *Builder* as ood at extras"!

It is reasonable to assume that the adver- er is a "hustler," whose proper antidote d offset is a clerk of works who is strong omissions and deductions. But there are emen, and many of them, whose training practical workmen has created in them a ire for good work; for not by "hustling," t by the alchemy of methodical manage- nt, are businesses built up and profits de.

The greatest misfortune that can befall a lding is for it to be entrusted to a builder ose knowledge of building is confined to £ s. d. columns of his ledger, or to a eman who has not worked at one or other the building trades, for in neither of se men can be found sympathy with their rk. One occasionally meets them, and the perience is such that one never afterwards gets them!

There are workmen who do love their rk, and who as a consequence sometimes fer for it. They do not constitute the lk of the workmen, and when any unusual ce of work requiring additional skill and cience has to be done it is to these men it es; they are found on every job in more less numbers, generally less.

To the writer of this letter it always seems safe to generalise in comparisons between skill and workmanship of the builders d artisans of past centuries and to-day. the first place, the Middle Ages (476 to XVth century) knew no builders in the ancial sense as they exist to-day; for, s Professor Thorold Rogers in "Six nturies of Work and Wages," "One dable fact in the economy of the XVth tury is the development of the capitalist isan. At a previous period of social tory in England this personage has rcely an existence. The farmer, land- ner, or noble, the monastery, or lay cor- ration, when it wants products on which craftsman's skill is required, buys the terial in a raw state and hires the smith other artisan to fashion it. . . . But the middle of the XVth century small airs were done by craftsmen, who send in ir charges with a bill of particulars. w the growth of this system proves that artisan was beginning to accumulate such pital as would enable him to wait for and l with customers, and therefore is indirect dence that wealth was growing."

n the erection of our great mediæval ldings the commercial instinct seems to re had no place; "hustling" was not wn, for time did not count in an age when at and religious-minded men were content h the consummation of one noble achieve- nt in their lives. And then, again, the ddle Ages (apart from its feuds and the uggle between Church and State for pporal supremacy) was an age of rest. e prospective craftsman served his term apprenticeship to his guild and then com- nced his Wanderjahre (as in the German lds), to later complete his masterpiece, ing him coequal fellowship in the guild. was an age in which every man had his ce (one of the chief recommendations of dalism), with a healthy, invigorating airy permeating the members of each tion of society, calculated to bring out of han the best he had in him to give.

"These workmen," said I to a Church nitary conducting me through Hereford hedral, "must have loved their work." They loved Almighty God!" was the quick ponse. Yes, we like to think of the diæval craftsmen as "aureoled workmen"; l William Morris stands credited with the ing that a present-day mason could not rk a stone with the skill of a mediæval son. But Morris was a mediævalist in ught and craftsmanship, and this must taken as one of the exaggerations of his alism.

n spite of the fact that all the conditions re highly favourable to the production of d work, one does occasionally find when ng through our cathedrals and minsters ividual pieces of workmanship which in ecution would not pass muster in work of the present day. And however much has been said, written, and sung of the builders and craftsmen of the past (at the mention of whom one sometimes feels disposed to bare his head), we have to-day buildings in point of constructive soundness which we venture to say cannot be surpassed—nay, cannot be equalled—by buildings of any past ages.

And this in spite of the fact that our apprenticeship system is gone—for what parent would now consign his son to a seven-years' apprenticeship, with the prospect of uncertain and casual employment at the termination of that period? For master and man now stand facing each other (unfortunately) in exacting attitudes, all sympathy between employer and employed eliminated, "like an Egyptian pitcher of tamed vipers, each struggling to get its head above the others." "We see the causes of disease in operation," say you. "Whence," we may ask, "is to come the remedy?" Echo answers, "Whence?"

F. Walker,
Clerk of Works.

Port of London Authority Competition.

Sir,—With reference to the publication in last week's *Builder* of the names of the six architects selected by the assessor to send in designs in the final competition, the same give promise of an interesting result and the hope of a fine building in the end. One hundred and seventy designs were submitted in all, and, as it is estimated that each would have cost 300,000*l.* to build, they may be taken as representing the architectural equivalent of 51,000,000*l.* of bricks and mortar.

Under the system of a double-barrelled competition, 164 of these designs vanish into the obscurity of the lumber-room, and the good that is in them dies; that is to say, the educational value they may have to other competitors by way of comparison, and even consolation, if, peradventure, one may be found worse than one's own. Sent out as most competition drawings are, like spoilt children whose parents have lost their sense of proportion, there is great good resulting in their being placed side by side with robuster specimens.

It is quite conceivable that in the 164 designs returned this week to their authors there may be a plan, perhaps too wildly "Futurist" for staid citizens, but of which parts are as excellent as the curate's egg; yet another may have some wrinkle as to the correct method of indicating the latest "Neo-Grec" type of elevation, which, rendered negative by lack of planning, would yet be informing to the competitive aspirant.

The competition was an extremely interesting one in that it was combined with a piece of town planning, and it is fair to assume that the lay-outs and resulting sites and plans for the Authority building are varied in type; it is equally fair to assume that the assessor will have selected the six all very much on the same line, and the one that he considers the proper one. The object, then, of this letter is to urge that steps should be taken to publish, in miniature if need be, as many of the varied treatments as it may be possible to obtain.

This course is not suggested with any other motive than that of making competitions as educational as possible. It would have been infinitely preferable if the heavy load of responsibility could have been shared by a jury of assessors, but so long as architects are content to compete, and possibly win, under one man, the converse holds good, and they must lose cheerfully under the same conditions.

C. H. B. Quennell.

INTERCOMMUNICATION COLUMN.

Damp Houses.

Sir,—Your correspondent is not very precise as to his trouble, but I understand from one who has successfully prevented damp from coming through outer walls that he merely painted the inner side of his walls with milk. He used country milk—not the London product—and tells me that there is no after effect, such as the smell of stale milk, and that he absolutely cured dampness by the process.

S. Whitmore Robinson.

COMPETITION NEWS.

Competition for a Façade, Regent's Quadrant.

In view of the importance of securing a suitable architectural treatment for Regent's Quadrant, the proprietors of the *Builder* have decided to institute a competition for designs suggesting a façade in harmony with the Piccadilly Hotel, but giving more consideration to the requirements of the retail trader.

An illustration of Mr. Norman Shaw's design is published herewith, and remarks on the question will be found in our article on page 444 of this issue.

Drawings.

The drawings should show a suggested façade for the frontage between Piccadilly-circus and the hotel, which is to be 220 ft. in length; they should be prepared to a scale of one-eighth of an inch to the foot, and include an elevation, with such plans and sections of the front wall as are necessary to explain the design.

The rendering must be in monochrome, but in other respects the competitor is free to select his method of presentation.

The drawings to be mounted on one strainer or card without margins, and bearing no name or motto.

The author's name to be enclosed in a sealed envelope firmly attached to the drawing.

Dates

Any questions should be addressed to the Editor of the *Builder* on or before April 29. Replies will be printed in our issue of May 3.

Drawings must be delivered at the office of the *Builder*, 4, Catherine street, W.C., on or before 5 p.m., Friday, June 14.

Assessors.

The adjudication will be made by Mr. E. A. Rickards, F.R.I.B.A., and Mr. Alan E. Munby, A.R.I.B.A.; their decision will be final and binding on all parties.

Premiums.

The sum of 25 guineas will be paid to the author of the design placed first by the assessors, and a further sum of 25 guineas will be divided between the authors of other designs in such proportions as may be decided on by the assessors.

Publicity.

All the designs submitted will, by kind permission of the Architectural Association, be exhibited in their galleries at Tufton-street for at least one week. The public Press will receive notification of the Exhibition, at which the names of the authors will be attached to the drawings, unless a request to the contrary is enclosed in the sealed envelope. The *Builder* will publish reproductions of the premiated designs.

FIFTY YEARS AGO.

From the *Builder* of April 19, 1862.

The Embankment of the Thames.

On the 10th inst. a deputation from the vestry of the parish of Chelsea waited by appointment on the Right Hon. W. Cowper, the Chief Commissioner of Works, at the House of Commons, to urge upon him the desirability of having the embankment of the Thames continued from Westminster to Battersea Bridge and the low-level sewer carried under it. Mr. Tite explained the objects of the deputation; and Mr. Cowper, in reply, said he fully agreed with them that the present was the time to move in the matter: but as the case of Chelsea differed from that of the Strand and Fleet-street, and had no excessive traffic of which to be relieved, he did not see how any portion of the coal dues could be applied to the work of embankment there.

EDITORIAL SUMMARY.

The leading article is entitled "Country Planning."

A second article deals with the question of the new buildings in Regent's Quadrant (p. 444). In this connexion, particulars of a competition instituted by the proprietors of the *Builder* will be found on p. 453.

In "Notes" Column (p. 445) will be found observations on: "Another Hastings Competition"; "How Many Houses to the Acre?"; "The Teaching of Design"; "Port of London Competition"; "The British School at Rome."

A report will be found on p. 445 of the meeting of the Royal Institute of British Architects, held on Monday, when the discussion was resumed on "The Newer Responsibilities of Architects," and a paper read by Mr. A. Saxon Snell on "The R.I.B.A. Conditions of Contract: Some Points for Revision."

A meeting of the Architectural Association was held on Monday, when Mr. Lawrence Weaver, F.S.A., read a paper on "Scottish Houses of the Renaissance." Our report will be found on p. 448.

Some notes, with illustrations, on the Miners' Hall Competition, Bolton, are given on p. 450.

In "Correspondence" columns (p. 451) will be found letters on: "The Ideal Builder"; "The Port of London Competition."

In Architectural Societies (p. 456) will be found brief reports of: "The Gloucestershire Architectural Association" and the "Bristol Society of Architects."

The Monthly Illustrated Historical Review (p. 457) contains: "The Architecture of Portugal—II."; "Gwalior Fort"; "Ancient Monuments in Ireland"; "Brass of Sir John Cassy"; and Notes.

The Building Trade Section, on p. 462, includes: "Recent Workmen's Compensation Cases"; "Building Notes from Australia"; "Labour in the Building Trade"; "Ipswich Building Trades Association"; "Projected New Buildings in the Provinces," etc.

At the Surveyors' Institution on Monday a paper was read on "The Cost of Labour in Connexion with the Erection and Maintenance of Buildings." An abstract appears on p. 465.

A report of the annual general meeting of the Architects' Benevolent Society appears on p. 466.

Book Notices (p. 467) include: "Local Legislation, 1909 to 1911"; "The Workmen's Compensation Act"; "Butterworth's Workmen's Compensation Cases"; "Practical Sewerage and Sewage Disposal," etc.

Legal Column (p. 468) includes notes on: "The London Building Act: Government Buildings."

Lindsey Hall, Kensington.
Mr. Ronald P Jones, Architect.

MEETINGS.

FRIDAY, APRIL 19.

The Institution of Mechanical Engineers.—Paper by Dr. Walter Rosenhain and Mr. S. L. Archbutt on "Tenth Report to the Alloys Research Committee: On the Alloys of Aluminium and Zinc." 8 p.m.

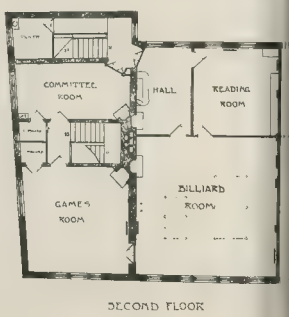
ILLUSTRATIONS.

Lindsey Hall, Kensington.



THIS building, recently completed the gift of Mr. Edwin Tate Church Institute in connexion Essex Church, Kensington. It tains three distinct sets of rooms, approac independently, and each self-contained, capable if required of being opened up thro out. The main hall on the ground floo reached through a vestibule, panelled in with a floor of verte antique and Sicilian mar leading also to the cloakrooms. The measures 45 ft. by 27 ft., and will seat ab 200. The walls are panelled in oak and divi into bays by pairs of Ionic pilasters; stage is partly a projecting platform and pa a recessed stage behind proscenium curta while over the emergency door at the other

GROUND FLOOR

FIRST FLOOR

SECOND FLOOR

Lindsey Hall, Kensington.
Ronald P. Jones, Architect.

here is a balcony to carry the electric lantern, hus avoiding the danger and inconvenience of lacing the lantern in the centre of the floor pace.

The ceiling ribs are decorated with a foliage and copied from an example at Ham House, while the wreath and festoon panels between he pilasters were modelled for their position.

The room is heated by radiators recessed in he walls, and faced with pierced brass grilles; lso by an open fireplace in cipollino and icilian marble with a carved oak mantel ontaining Mr. Tate's coat-of-arms, and, above he shelf, a brass-faced clock recessed in the anelling.

The electric light is arranged in eight Holohane pendants, with brass fittings, which, like ll the details of metalwork, carving, etc., were pecially designed by the architect to harmonise ith the general treatment of the hall.

The rest of the ground floor is occupied by wo entrances and staircases from the side reet, and between them a kitchen for the reparation of light refreshments, which can lso be entered from the hall. The western ntrance forms an emergency exit from the age end of the hall.

The east staircase, which has a tiled dado, ads to the small hall on the first floor, a square oom panelled in green stained wood up to the ornice, and fitted with cupboards and bookases; the classroom opposite communicates ith the kitchen by a service lift, and can be sed as a tearoom for meetings in the small hall.

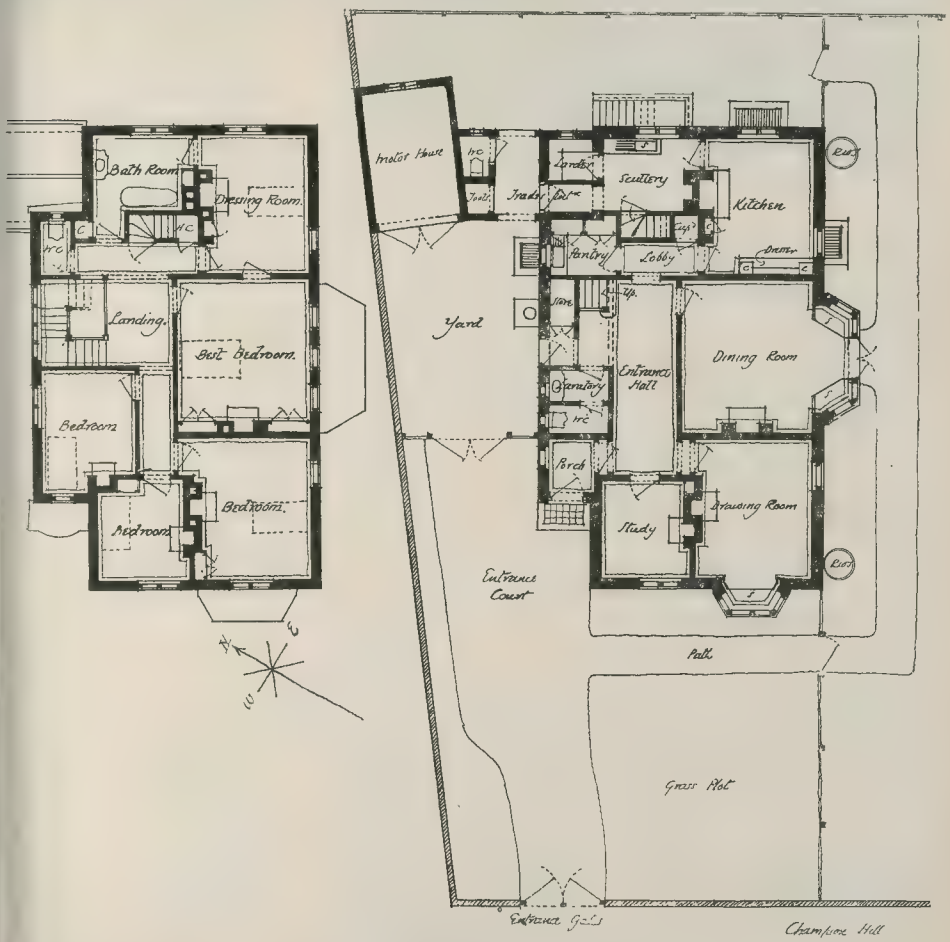
The west staircase leads direct to the second floor, which is occupied by the rooms of the Essex Church Men's Club, providing accommodation for billiards and other games, library and reading-room, committee and music room, etc., for a membership of about 150. All these rooms are heated by radiators, and, if necessary, gas fires; they have green stained wood dados and joinery, and distempered walls, and the floors throughout the building are of oak block laid herring-bone (that of the large hall being oak parquet).

As a small hall of this type is much needed in Kensington for private concerts, receptions, At Homes, etc., the entrances are so arranged that when the hall is not required by the societies of the church it can be let for such purposes, without interfering with the use of the other rooms in the building.

The exterior is faced with red sand-faced bricks in two shades, with a Portland stone cornice, and roofed with "Perry" green Westmorland slates.

The architect was Mr. Ronald P. Jones, M.A., Stone-buildings, Lincoln's Inn; general contractor, Mr. J. A. Hunt, of Hoddesdon, Herts (who also executed the oak panelling and the decorative leadwork on the exterior); heating and sanitation, Messrs. Matthew Hall & Co.; electric lighting, Messrs. Dickinson; carving in oak and brick and decorative plasterwork, Messrs. Jackson & Sons; marble, Messrs. Farmer & Brindley; metalwork—radiator fronts, clock face, glazed panels to swing doors of hall, and electric light fittings, the Artificers' Guild; lock plates and door-handles, the Birmingham Guild of Handicraft; ventilation, Messrs. Boyle; tile dado, Messrs. Van Straaten.

The furnishing and equipment was carried out by Messrs. Waring & Gillow, who specially wove the decorative bands for the hall curtains to suit the design and colour scheme of the hall.



House at Champion-hill.

This house was built for Mr. A. B. Falkner. The walls are 14-in. brickwork, with the quoins slightly emphasised by means of a brick course projecting every two courses; the same applies to the chimneys. The roof is covered with hand-made tiles. The conditions of the site necessitated the narrow front to the road, the principal front facing the garden. The general character of the house is Georgian, with Adam detail in the finishings and woodwork generally.

Mr. G. Ll. Morris, of Finsbury-square, E.C., is the architect.

Business Premises, Berners-street.

This building was erected for Messrs. Arthur Sanderson & Sons, Ltd., wallpaper manufacturers. The basement and sub-basement are used for storage and other purposes; and in the sub-basement is installed electric plant, which provides the current for the lighting, lifts, and water supply, the latter being pumped up from the well in the basement of No. 53, Berners-

House at Champion-hill for Mr. A. B. Falkner.
Mr. G. Ll. Morris, Architect.

House at Champion-hill for Mr. A. B. Falkner: View from Road.
Mr. G. Ll. Morris, Architect.

street. On the ground floor is a large showroom and a van garage at the rear. Over the garage are four floors of offices used by Messrs. Sanderson's staff; and over the showroom fronting on Berners-street are six floors of offices let off to different tenants. The new buildings are connected with No. 53, Berners-street and the ground and basement floor levels, the openings being fitted with fire-resisting sliding doors. Secondary and external fire-escape staircases are provided. The floors and roofs are of reinforced concrete and steel, the principal floors are "sound-proofed," and the rest constructed on the "Kahn-bar" system. The general contractors were Messrs. Holloway Brothers (London), Ltd. The architect was Mr. Louis A. Hayes, A.R.I.B.A.

Gwalior Fort.

THESE illustrations are referred to in the article in the Monthly Historical Review (p. 459).

ARCHITECTURAL SOCIETIES.

The Gloucestershire Architectural Association: Tower and Spire of Cheltenham Parish Church.

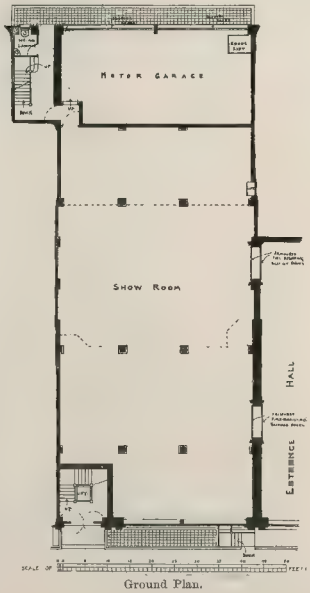
A meeting of this Association was held on Thursday, March 28, at the Northgate-mansions, Gloucester, the President (Mr. Walter B. Wood) being in the chair. The business on the agenda having been attended to, Mr. T. Overbury (Fellow) read a paper entitled "The Recent Reparative Work to the Tower and Spire of the Parish Church, Cheltenham: The Use of Ferro-Concrete in Connexion therewith."

After a brief historical description of the church, Mr. Overbury gave a detailed description of the work that had been done under the direction of his firm (Messrs. Healing & Overbury) in repairing the tower and spire. Serious cracks had appeared in the spire, and it was decided that these were due to the oscillation caused by the ringing of the peal of ten bells, which were badly hung on an oak frame at different levels, the walls of the upper stage of the tower carrying the squinch arches being exceptionally thin and without buttresses, and pierced by lights on all sides. It was found necessary to take down and rebuild the top 14 ft. of the spire, and the vane and rod, which were defective, were replaced with new, while the old weathercock discarded at a previous rebuilding was refixed again. The thin walls of the upper stage of the tower were strengthened internally by a framework of ferro-concrete piers and cross-beams on the Hennebique system, these piers being dovetailed into the walls at intervals.

The bells were rehung at one level on an iron frame carried off the thicker walls of the lower stage. While the work was in progress an additional two bells were presented to the church, and of necessity these had to be hung at a higher level, but carried by the main frame, thus making a peal of twelve bells.

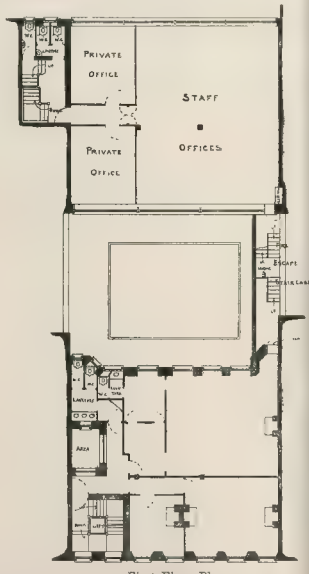
The cracks were pointed up and a few defective stones cut out and replaced, the whole of the work being carried out with the least possible cutting to the existing fabric. Messrs. Frankland Phillips & Co. were the steeplejacks, and the ferro-concrete work was carried out by Messrs. Hobrough & Co., of Gloucester.

The lecture was illustrated with numerous lantern slides, detail drawings, and models. A hearty vote of thanks was accorded Mr. Overbury for his most instructive and interesting paper.



Bristol Society of Architects.

The annual general meeting of this Society was held at the Fine Arts Academy, Queen's-road, Clifton, on Monday evening. The election of Council and Officers for Session 1912-13 resulted in the following gentlemen being elected:—President, Mr. G. H. Oatley, F.R.I.B.A.; Vice-Presidents: Messrs. J. Foster Wood, F.R.I.B.A., and Mowbray A. Green, F.R.I.B.A. (Bath). Members of Council: Messrs. G. C. Awdry, F.R.I.B.A., T. H. Weston, F.R.I.B.A., G. C. Lawrence, A.R.I.B.A., F. W. Wills, F.R.I.B.A., R. C. James, F.R.I.B.A., W. L. Bernard, F.R.I.B.A., and Mr. C. F. W. Dening, Lic.R.I.B.A., Hon. Secretary. Associate Members of Council: Messrs. B. Wakefield, Lic.R.I.B.A., and A. B. Botterill, A.R.I.B.A. Mr. Botterill was appointed Hon. Treasurer.



Mr. Mowbray Green (Bath) proposed, and Mr. G. C. Lawrence seconded, a hearty vote of thanks to the retiring President, Mr. J. Foster Wood. Both gentlemen spoke in eulogistic terms of Mr. Wood's services to the Society. Mr. Wood suitably responded. The thanks of the Society were also accorded to the retiring Secretary, Mr. T. H. Weston, Mr. R. C. James proposing and Mr. C. F. W. Dening seconding the vote to Mr. Weston, who during his three years of office has very ably conducted the affairs of the Society.

A most interesting collection of drawings by Bristol architects of the last generation was on view and added considerably to the enjoyment of the evening.

Any communications dealing with the Society should in future be addressed to the Hon. Secretary, Mr. C. F. W. Dening, Gaunt House, Orchard-street, Bristol.

THE ARCHITECTURE OF PORTUGAL.—II.

(*Continued from page* 303.)

N 1095 the county of Portugal, extending from the Galician border as far south as Oporto, was granted as a fief by the ag of Castile to Henry of Burgundy, and in 9 his son, Alfonso Henry, assumed the royal e. For two and a half centuries his descend- s carried on a constant struggle with the ors, in the course of which, in spite of iodical reverses, they gradually drove them ther and farther south to the Tagus and ond it. The kingdom reached its present ensions, and Lisbon became its capital in 0.

Since its growth was from the north south- ds, it is in the north that we must look for first beginnings of a national Christian hitecture. There, as in Spain, the Roman- ue type of church was introduced from nce, and a number of XIth and XIIth tury churches, remarkable for nothing but ir small size and extreme simplicity, not to their rudeness, due in part to the hardness he granite they are built of, are to be found ttered along the northern border and, in ening numbers, as far south as the Tagus. plan they usually consist of a rectangular ve and chancel, the former being occasionally ceded by a narthex, and the roofs are of low h. Such are São Miguel at Guimarães and Martin de Cedo Feita at Oporto.

After the foundation, in 1078, of the great hedral dedicated to St. James at Santiago Compostella, on the model of St. Sernin at ulouse, and probably under the guidance of nchmen, a more developed form of church hitecture began to arise. The churches of s new type followed a basilican plan, with nsept projecting beyond the nave aisles, and idal chapels to the east of the transept, and s became established as the national plan, y varied in a few of the more important later rches, such as the cathedral of Lisbon, by addition of an ambulatory with radiating pels carried round the choir, a feature already nd in their South French prototype. This se of church, owing to the gradual advance of Portuguese kingdom, is to be found even th of the Tagus. The most perfect example the Romanesque period is the beautiful Velha, or Old Cathedral, of Coimbra with its austere fortress-like exterior and its long sombre nave (Fig. 6), culminating in a richly-gilded altar-piece gleaming in the fuller illumination of the transept. It was built probably at the close of the XIIth century. The aisles have quadripartite groined vaults and the nave a barrel-vault strengthened by transverse arches and supported by continuous half-barrel-vaults over the triforium galleries, there being no clearstory. The arches are semicircular or stilted and unmoulded, the vaulting and arcade shafts semicircular in plan, and attached to square piers. The capitals are beautiful and extremely varied, some approximating to Byzantine types. The whole ground story of the interior, including the piers, was till lately entirely veiled in a rich embroidered robe of tiles of Moorish design probably of the XIVth century, which a recent "restoration" has seen fit to strip off. (See Fig. 1, March 15.) The mellow splendour of the effect thus produced can be guessed at from the portions spared on the chapel walls. Apart from a window over the west door, the church is chiefly lit by windows in the transepts, and in the lantern over the crossing. Externally the walls, pierced only by a few round-headed openings and almost without horizontal members, are carried up as a battlemented parapet concealing the roof (Fig. 5). Owing to the long struggle which filled the Middle Ages in Portugal, many of the churches served as forts, and bear traces of the fact in their appearance to this day. The Cathedrals of Oporto and Evora are other

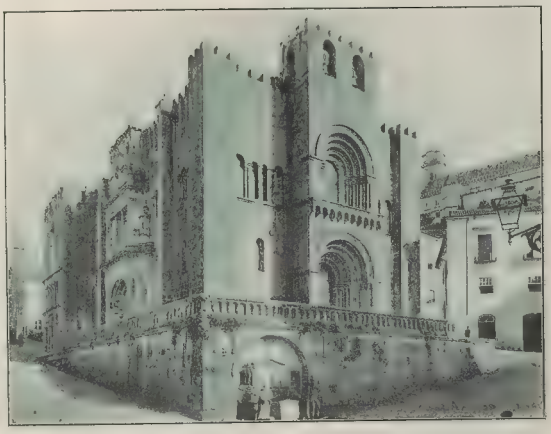

Fig. 5. Coimbra: The Old Cathedral from the North-West.

Fig. 6. Coimbra: The Old Cathedral. Nave looking East.

cases in point. The battlements assume a great variety of forms. The Old Cathedral of Coimbra has an oblong bellcote at the centre of the west end over a sort of projecting porch, but a more usual arrangement is found in the twin stumpy west towers of Oporto and Braga Cathedrals. At Coimbra, again, the central lantern is square, with a low domical roof, covered externally like those of the apses with Moorish tiles, but at Evora is a lantern of more northern type, octagonal, with a steep conical roof, flanked by bold pinnacles. Portuguese roofs are in general of low pitch, and it early became usual there, as in Spain, to roof the entire vaulted portions of churches with flats of accurately fitted slabs of stone, as we shall see later on at Batalha. Many churches of this early period have interesting variants on the familiar type of round arched doorway with receding Orders, square in section and variously enriched, and with corresponding shafts carrying them. Considerable taste, and even delicacy, is exhibited in the design and carving of the ornament. A peculiarly elaborate example of such a doorway recalling that of our Temple Church, but with fantastically twisted shafts, is the west doorway of São Cristobão at Coimbra, an edifice now unfortunately undergoing reconstruction.

The Transitional period in Portugal is represented by two classes of church—one like the remarkable polygonal Church of the Templars at Thomar (*c.* 1165) or the Sé at Evora (*c.* 1200), where the construction and detail is Romanesque, but the arches and windows pointed, and a second in which, as at the early XIIIth-century church of São João de Alporão at Santarem, the construction and detail are already Gothic, though the arches remain round.

But Romanesque did not develop here independently into a pointed style any more than in Italy or Germany, and Portugal owes her earliest Gothic monuments to foreign importation. The most important example of these is the Cistercian church at Alcobaça, the largest church in Portugal, serving what grew into one of the largest monasteries in Christendom. It was begun in 1158 and finished in 1211. Its plan, which is almost identical with that of Clairvaux, and was probably designed by a Frenchman, consists a nave of twelve bays with aisles, a double aisled transept with three bays in each arm and a semicircular choir, consisting of one rectangular bay (corresponding to the eastern aisle of the transept) and a semicircular apse with an aisle and nine radiating chapels. It is doubtful whether the foreigners employed carried out more than the choir, for, apart from the plan, the rest of the church shows a wide departure from northern practice. Though the apse vaults are supported by flying buttresses the builders of the nave (Fig. 8), while they adopted a system of pointed quadripartite ribbed vaulting, did not venture on a similar system, and possibly to replace the native practice of using half-barrel-vaults over the triforium to buttress a barrel-vault over the nave, they carried up the aisle vaults to the same level as those of the nave. Their timidity is also shown in the excessive massiveness of the piers, which almost conceal the arcade and of the transverse ribs or, rather, arches which almost conceal the remainder of the vaults. Many of the half-round shafts which carry the transverse ribs are carried on corbels in order to accommodate the stalls destroyed by the French in the course of Masséna's retreat in 1810, which proved so disastrous to the art treasures of the country. This was no haphazard havoc wrought by a demoralised soldiery, but a systematic work carried out by order, parties being detailed for the destruction of specified works, for the complete execution of which scaffolding was actually erected in the church. There is, therefore, now nothing left to relieve the gaunt severity of this vast interior except a pair of charming pulpits perched high up on opposite piers and, in the distance, the exceedingly florid barocco decoration of the choir, which in its faded paint and tarnished gilding provides a not unpleasant splash of gorgeous colour amid the prevailing greyness.

Though pointed arches and rib vaults are used at Alcobaça, the timidity of the vaulting system and the exclusive use of round-headed windows illustrate the strength of conservatism in Portugal. Indeed, Romanesque tradition in one form or another prevailed in church architecture for many years after the erection of this church. On the whole, however, the XIIIth century, the heroic age of mediæval architecture in Northern Europe, was almost barren in Portugal, while the churches produced in the more fertile period of the XIVth century bear most of the characteristics which mark the work of preceding centuries in France and England.

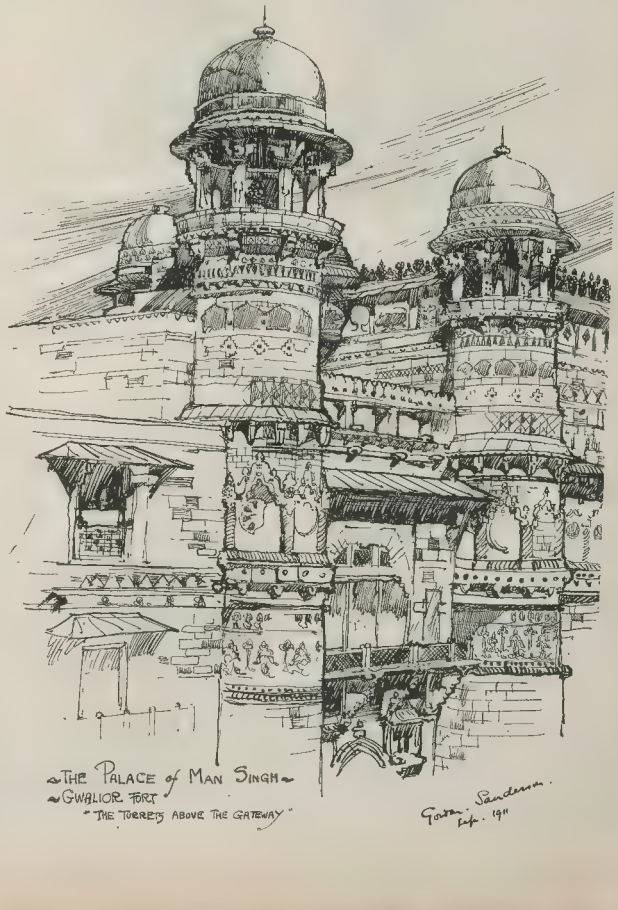
Thus Santa Maria dos Olivaes at Thomar, the mother church of the Templars throughout the Portuguese dominions, has single or coupled lancet windows and piers, whose capitals and bases are of the simplest form, passing from the octagon of the shaft to the square of the abacus by means of a curved splay. It has a wooden roofed nave and three polygonal vaulted apses and is one of the earliest churches built on the Franciscan or Dominican plan probably imported from Galicia. The slightly later Cathedral of Silves is of the same type, but with

Fig. 7. Oporto: The Cathedral from the North-East.

Fig. 8. Alcobaca: The Abbey Church. Nave looking East.

barrel-vaulted transept. Though not finished ill after 1327, the church of Sta Clara, on the ft bank of the Mondego, at Coimbra, would ass anywhere else for a work of the end f the XIIth century, with its bold square uttresses, its saddle-backed tower, with single ght windows in two recessed Orders, its corbel ble and circular lights, only one of which now tains its wheel tracery. The floods of the ver have silted up the floor of the nave to the ringing of the arcade, but it still retains its ointed barrel-vault. More refined and delicate its proportions and detail, but not much more dvanced in style, is the charming ruined chapel f the Castle at Leiria, which is not earlier than 324. It consists of a single unvaulted nave, ow roofless, and a vaulted polygonal apse. ne of the most important buildings of the ntury was the choir of the Sé at Lisbon, built after an earthquake, which occurred in 344, in the form of a long eastern arm with diating chapels, but of this little was left anding by the great earthquake of 1755.

To the XIVth century also are due many of he cloisters, which, as planted with palms, roses, nd a host of flowering shrubs and aromatic lants set in box borders and refreshed by lashing fountains, are one of the chief delights f Portuguese churches to this day. Cloisters re not, as a rule, placed, as in northern countries, or warmth and shelter on the south of the hurch, but rather on the shady northern side, r sometimes to the east or west. The earlier omanesque type had timber roofs carried by continuous arcade with coupled columns, as een at Cellas, near Coimbra, which, however, as late as about 1300. This type was after- ards generally replaced by a more advanced ne, divided into vaulting bays with bold uttresses, between which were two, three, or our arched openings under one wide arch. he enclosed, as well as the enclosing arches, re either semicircular or pointed, while the atter are even occasionally segmental, and the pandrel is pierced by a large circular opening, ften without tracery, as in the case of the athedral cloister at Oporto, built in 1385. he Old Cathedral of Coimbra has the lidest example of such cloisters, dating from he late XIIIth century (now undergoing a storation amounting to reconstruction), while hose of the monastery of Alcobaça and the Cathe- ral of Lisbon were begun about 1310. The lava- ory which is often found in such cloisters, in one ngle or the centre of a side, is an extremely harming feature. The Claustro do Silencio f Alcobaça contains one of great beauty Fig. 4), which, in spite of its date, corresponds n almost every characteristic to early XIIIth- entury French work. The curious later ountain which it contains is set askew, with hat purpose it is not clear. The pierced stone filling of the spandrel lights in this cloister illustrate the curious inability of the Portuguese builders to grasp the principles of Gothic tracery. The use of tracery in windows is, as a rule, extremely restricted in Portugal, and, where it occurs, it seldom grows in a natural way out of the treatment of the mullions and jambs, as in France or England, but appears like a piece of independent design inserted into the opening. The patterns used often bear traces of Moorish influence in their use of rectilinear geometrical motives or their resemblance to Cairene lattice-work, or to the Oriental type of wood and plaster tracery, covering the entire opening with small openings filled with bits of brilliantly-coloured glass, a method of glazing also actually employed in Portugal.



GWALIOR FORT.

THE fort at Gwalior, formerly the stronghold of the Maratha chiefs of the house of Scindhia, is perhaps one of the most interesting examples of mediæval Hindu architecture in India. The palace of Man Singh, which occupies the north-east corner of the fort plateau, was built about A.D. 1500. It was the admiration of the first Mughal emperors, and without doubt served as a model for their own edifices. The east façade, some 100 ft. in height, is divided up by a series of towers, each crowned with a cupola or chattri. Blue, green, and yellow tiles, in the form of candelabra, elephants, geese, and peacocks, give to the wall surface an unrivalled charm and lightness. The interior consists of courtyards in which the same tile decoration is found. An interesting feature are the parapets, set so as to form comfortable backs for the palace inmates reclining on the roof.

In one courtyard the brackets are in the design of leogryphs—a common feature in Buddhist and Brahmanical sculpture. The fort also contains about a dozen Jain and Hindu temples of no little interest, while the rock sculptures are, according to the late General Cunningham, "unique in Northern India." They were unfortunately mutilated by Babar, the first Mughal Emperor, in A.D. 1527. In his memoirs he refers to the sculptures, and says:—"They have hewn the solid rock of this *Adwa*, and sculptured out of it idols of larger and smaller size. On the south part of it is a large idol, which may be about 40 ft. in height. These figures are perfectly naked. *Adwa* is far from being a mean place; on the contrary, it is extremely pleasant. The greatest fault consists in the idol figures about it. I directed them to be destroyed."

The Mughal Emperors, Jahangir and Shah-jahan, in their turn added to the palace buildings, but their additions are of little interest architecturally. The fort has seen stirring times. First besieged without avail by Mahmud of Ghazni in 1023, it was taken by Muhammad Ghori in 1196. The Muhammadans were turned out in 1211, but Altamsh, Sultan of Delhi, recovered it in 1231, after a year's siege. Then, after several other sieges, it was eventually turned into a State prison by the Emperor Akbar, and continued as such until the decline of the Mughal Empire. In 1761 the city was taken by the Jats, and a few years later was wrested from them by the Mahrattas. The East India Company took it in 1780 and restored it to the Jat Rana. Four years later the Mahrattas again gained possession, but were evicted by the English in 1803. In 1805 it was restored to the Mahrattas, in whose possession it now is.

The present Chief, Colonel Maharaja Sir Madho Rao Scindhia, G.C.S.I., takes a keen interest in the preservation of the ancient monuments of his dominion, and some most creditable conservation work has been carried out in the fort during recent years

Sir John Cassy and Wife, 1400 (Deerhurst, Gloucestershire).

ANCIENT MONUMENTS IN IRELAND.

THE Commissioners of Public Works in Ireland have just issued a Report of their proceedings for the year 1910-11 in connexion with buildings of which they are owners or guardians under the Irish Church Act, 1869, the Ancient Monuments Protection Acts, 1882 and 1892, and the Irish Land Act, 1903. The structures vested in the Board under the Irish Church Act number 137, and of these twenty-five have been repaired during the past year, and works executed to arrest their dilapidation. The number vested under the Ancient Monuments Acts has been increased by the addition of two during the past year, making a total of eighty-one now vested in the Board under these Acts. At twenty-one of these it was found necessary to carry out works of preservation in 1910-11. Under the Irish Land Act of 1903 the Estates Commissioners offered a number of structures, and it was found practicable to accept the guardianship of two as ancient monuments. The number of monuments or groups of monuments now vested or placed on the Schedule of Structures in charge of the Board under the various Acts is 218. This figure, however, does not give a correct idea of the extent of the work done, as in many cases there are several structures included under one group. An analysis by classes gives the following result :—Round towers, forty-two; earthworks, nine; stone forts, sixteen; cromlechs, tumuli, ogham stones, and beehive structures, eighty eight: castles, ten; oratories, primitive churches, and ruined cathedrals, 171; Cistercian abbeys, ten; Augustinian, Franciscan, and Dominican priories, forty-two; crosses, fifty-two; total, 440. The care of these ruined buildings entails besides their structural maintenance the removal of vegetation, enclosing, provision of notice boards, and the prevention of injury by visitors and trespassers. Great difficulty arises in preserving certain ecclesiastical ruins in a state of decency, because the ground inside and around their walls is used for the purpose of a graveyard, and is not under the Board's jurisdiction. Too often in such places the provisions of the Burials Act are disregarded, and the local authority fails to exercise any proper control over burials. The unsightly condition of the interior of Holy Cross Abbey and the Graveyard at Clonmacnois are examples of this neglect.

The two new structures offered by private owners for vesting in the Board, and which have been accepted, are Inch Abbey, Co. Down, and Kilcooley Abbey, Co. Tipperary. The former is a Cistercian foundation of 1180, erected by De Courcy. It has the choir walls standing, with the three-light east window, and a pair of side windows in the north and south walls of the choir in a comparatively good state of preservation. Kilcooley Abbey is another Cistercian foundation of the date of A.D. 1200, the same year as the foundation of the Abbey of Corcomroe.

In addition to the structures already referred to, the Board have become responsible for advising as to the repair and preservation of several valuable historic buildings in charge of Government Departments. Four historic Irish castles being in use by the War Department, it was suggested that an arrangement should be made similar to that which exists in Great Britain between the Army Council and the Office of Works, and after due consideration it has been decided that the buildings shall remain in the occupation of the War Department, and that any necessary repairs shall be carried out by that Department, but that no structural alterations shall be carried out without reference to the Commissioners of Public Works, and that the advice of the Inspector of Ancient and National Monuments shall be available for the War Department when any question arises on which his knowledge and experience would be of value. The castles referred to are the following :

Limerick Castle, with the adjoining bridge over the River Shannon, was built in the time of King John. It was placed to command the bridge over the Shannon, and has five towers and a connecting wall; the westward tower nearest the bridge is most injured by cannon, and its top story has been removed. The entrance was on the north side, and was flanked by two circular towers, which are still perfect externally.

Athlone Castle and the bridge over the Shannon were built in the time of King John on the site of an earlier castle and bridge of the O'Connors. In 1455 and 1490 it was taken and retaken, and in 1537 it is stated that the King's castle had been recovered from the "usurpation of Irishmen." It was held in 1690-91 for King James, but eventually surrendered. Sir Henry Piers, writing in 1682, says :—"On the side that faceth the river are the rooms and apartments which served always for the habitation of the Lord President of Connaught, Governor of the Castle." In the centre is the principal pile, an irregular, ten-sided structure, rising from a circular base; it is circular in plan internally.

Carrickfergus Castle was erected during the Anglo-Norman occupation of Ulster early in the XIIIth century on the site of an ancient Irish fortress. It was occupied by King John when in pursuit of De Lacy. During the short period that Edward Bruce assumed the sovereignty of Ireland, he made the castle his chief residence. The castle, like other structures of its kind, had its numerous "repayrings" after frequent burnings and spoilings by "rebells and Scotts, our enemies," but the external walls, being 10 ft. to 12 ft. thick, have remained secure.

Enniskillen Castle, only a small fragment of which now remains, stood on the left bank of the River Erne, having been converted into a military barrack.

THE BRASS OF SIR JOHN CASSY AND WIFE, 1400, DEERHURST, GLOS.

JUDGE CASSY was chief Baron of the Exchequer. The minever lining of his mantle is well shown, and his corf, which is of two pieces laced together over his head. His feet rest on a lion, and he lies under a fine double canopy,

h his wife beside him. She rests her feet her pet dog Terri, whose name is written rneath. This is now the only surviving mple of a pet commemorated on a brass. ither existed at Ingham, Norfolk, to a kke," but this brass, with many others, sold for old metal in 1800.

he lady wears the characteristic dress of the od, of which large mittens are perhaps the t striking feature. Her hair is enclosed in t.

his brass has, since the rubbing was taken, the figure of St. John the Baptist; the r figure is of St. Anne and the Virgin. he marginal inscription is in raised letters h foliage and a strange little dragon. The ttes in the centre of the pediments should noticed.

he length is 7 ft. 4 in.; width, 3 ft. 1 in.

HISTORICAL NOTES.

e Corbridge xcavations.

In the annual report of the Council of the Newcastle Society of Antiquaries reference is made to the excavas of the Roman city of Corstopitum (Corge) and to the discovery of gold coins in llent preservation. The latest date represed in the hoard was A.D. 159. The importe of this hoard and that of 1908 to Roman hæology, it was said, was the illustration ch they gave of two periods of disturbance, ely differing in time, and by their help and of the pottery obtained archæologists were oming able to construct the history of this portant site. It was known in the time of ricola, and occupied, possibly with periods abandonment, until the eve of the departure the Romans from Britain. The work of estigation had already occupied six succesr summers, and yet a seventh year's work uld be entered upon with promise of even ater achievement; for, notwithstanding all t had been accomplished up to the present, than half the site had as yet been explored, a task of years remained to be done. The ncil hoped that a proposal to re-erect the old ite Cross in Newcastle as a memorial to the King Edward would be carried out.

Winchester Cathedral.

In the wall of the retro-choir of the Cathedral Mr. N. C. H. Nisbett, architect to the Dean and Chapter, has discovered, ing the replacement of the missing canopy Bishop Æthelmar's monument, a cavity taining a leaden casket, beneath which was ole covered with a loose piece of lead. The hop, who died in Paris in 1260, directed that heart should be buried in the cathedral, and conjectured that his heart was placed in the den casket which has just been found.

reservation of Ancient Welsh Monuments.

At a recent sitting of the Royal Commission on the Ancient Monuments of Wales, held at the Royal Commission House, Mr. W. H. More, Crown Receiver of Woods and ests of Wales and Monmouthshire, gave dence concerning ancient monuments upon wn lands. The question arose to whom hæological finds discovered on the lands ed from the Crown would belong. Mr. More d that there were no clauses in existing leases ling with the matter, because he was of nion that such finds would naturally belong the Crown. In the case of quarries the ees had rights to work only natural stone—e *in situ*—and celts would surely come ter the head of manufactured stone. The ness agreed that it would perhaps be an antage to insert a clause dealing with finds en new leases were made out.—Sir Robert nter, Chairman of the Executive Council he National Trust for the Preservation of es of Historical Value and Natural Beauty, lained that the trust had promoted a Bill the preservation of monuments. He had also read Mr. Buxton's Bill on the same subject, but he did not agree with the principle of compensation introduced.—Mr. Thackeray Turner, ex-Secretary of the Society for the Protection of Ancient Buildings, said that when people wanted a building restored they raised a fund and got a contractor to do the work. Instead of that there should be on the spot an architect who understood the history of the building. A contractor often in his ignorance destroyed the most valuable thing. When monuments came under the control of the Government we should get a school of skilled repairers who would be set to work under the architect.

Wanborough Church, near Guildford.

The church and churchyard of Wanborough, near Guildford, are to be sold by auction in June, as part of the Manor House Estate, by instructions of the owner, Mr. George McKibbin. The church is a very ancient structure, having existed at a time when Cistercian monks occupied Waverley Abbey, near Farnham. The edifice is mentioned in the "Domesday Book," and by muniments of the XIVth century appears to have been dedicated to St. Bartholomew. For a long time it was unendowed, and when after the dissolution of the monasteries it came into lay hands no arrangement was made to provide the minister with a stipend. It was closed for a period of 200 years or more, during which time it served as a carpenters' shop and timber shed. An attempt at restoration, however, was made in 1861, and services have since been conducted there.

An Old House in Soho.

The home of Sir James Thornhill, No. 75, Deanstreet, Soho, adjoining the Royalty Theatre, has fallen into a sorry state of decay, and fears are entertained for the safety of the structure. The principal rooms are panelled; the staircase, chimneypieces, and other fittings are of the Early Georgian style, and the wall paintings of the principal staircase are by Sir James Thornhill, who was reputedly assisted by his son-in-law, Hogarth.

Caerwent (Venta Silurum).

We read in the *Times* that a large part of the south or Port wall of the Roman city has collapsed, exposing the rubble or herring-bone masonry, which also is endangered. The north side of the wall, which is over 20 ft. high and is one of the finest after its kind in the kingdom, is filled with soil to within a few feet from the top, but the south side is quite free. The fall outwards of the southern and unprotected face of the wall is attributed to expansion of the soil inside by the recent change of temperature; thus far the core and the northern face are standing.

Parish Church of St. Edward the Confessor, Romford.

An appeal is made for contributions towards a sum of 500*l.*, the balance still outstanding of the Wykeham Hall and Church House Building Fund—the latter being the Chantry House, in the south-east corner of the churchyard, originally built by Avery Cornborough in the later half of the XVth century for the priest who served the chantry which Cornborough founded in the parish church. The Chantry House, which for more than three hundred years had been the Cock and Bell Tavern, was recently restored after plans by Sir Charles Nicholson, Bart., who designed also the adjoining Wykeham Hall as part of the parish institute. The church was built by New College, Oxford, a few years after the death of William of Wykeham, who gave the tithes to New College for a parish, a "peculiar" of the college, carved out of Hornchurch; the deed of consecration is dated March 29, 1410. In the church is the monument of Sir Anthony Cooke, *ob.* 1576, King Edward VI.'s tutor, and father-in-law of Lord Burleigh and Sir Nicholas Bacon.

Zimbabwe.

A survey is now being mad by the Rhodesia Railway with the object of extending the Blinkwater-Umvuma line to Victoria. The proximity of the Zimbabwe ruins to Victoria will make it possible to visit these wonderful relics of a lost civilisation in a more speedy and comfortable fashion than is at present the case. Much speculation and a certain amount of diversity of opinion amongst experts have prevailed with regard to the original builders of great Zimbabwe and the adjacent citadel, whilst the absolute lack of native tradition upon the subject only tends to accentuate the mystery.

Besides carefully clearing the ruins of creepers and brushwood, the Administration is proceeding with the excavation of the old walls lying to the northward of the temple. The passages, secret chambers, and citadel have already been cleared, the area of the ruins at present exposed being about 4 sq. miles, although these limits, in view of recent discoveries, are not to be looked upon as being by any means final.

The Ancient Art of Tempering Copper.

The copper cutting implements of the Tarascans found in the Balsas River ruins in Guerrero are so hard that they would turn the edge of a modern knife, and it has been claimed that these people, along with the Aztecs and Toltecs, possessed the secret of tempering copper. On the other hand, copper knives and axes found at Atcopotzalco are so soft that they can be cut with an ordinary pocket-knife, although analysis showed that these copper implements were of the same composition in all three localities as the copper ores found therein. The blades from Guerrero, which are hard and apparently tempered, were made from the natural ore alloyed with nickel and cobalt, thus making the smelted alloy approaching steel in hardness. Thus the natural product gave an alloy of great hardness when heated and sharpened, whilst the other ores of practically pure copper, when smelted, resulted in implements which were soft and inferior in cutting value.

Therefore, many archæologists of Mexico deny that these people possessed the secret of tempering copper, the sharp cutting copper implements being the result of Nature's handiwork.

The Romans in Britain.

In his paper, "The Discoveries of Roman Remains in Britain in 1912," which he read to the British Academy a few days ago, Professor F. J. Haverfield described the recent excavations at Corbridge with their rich yield of gold coins, of sculptured fragments, and of vestiges of storehouses and other buildings. Professor Haverfield referred also to the Romano-British village at Casterly, Wiltshire, and to the explorations conducted by Mr. Miller and Mr. Stevenson at Cappuck, near Jedburgh, on the road from Corbridge to Newstead, which, it appears, was originally erected by Agricola.

Edmonton.

The Edmonton District Council have drawn up a statement describing several buildings in the district which possess historical and literary associations, and will forward the statement to the Office of Works with a view to measures being taken for their protection. The category embraces Bay Cottage, the home in 1833-4 of Charles and Mary Lamb; Bury Hall, the seat of President Bradshaw, the regicide; Bush Hill, the house of Sir Hugh Myddelton, protector of the New River, where are the remains of ancient circular earthworks; Salisbury House, where lived Judge Jeffreys; the house, in Pymmes Park, lately acquired for public resort, which Lord Burleigh occupied *temp.* Elizabeth; and the cottage in which Keats lodged, and the house, in Church-street, in which he served as assistant to Hammond, the surgeon, during which interval he composed his first volume of poems.

THE BUILDING TRADE.

RECENT WORKMEN'S COMPENSATION CASES.

An unusually heavy list of workmen's compensation cases has recently had to be dealt with by the Court of Appeal, and the litigation under this Act shows no signs of diminishing.

Injury by Strikers.

Poulton *v.* Kelsall was a case which had its origin in the strike amongst the transport workers. A man employed as a storeman acted as a carter for several days for his employers, and it was alleged that as an inducement to make him undertake this class of work his employers had undertaken to be responsible for his safety. After his work one day was over and he was on his way home, at a place about seven minutes' walk from his employer's premises he was attacked by strikers and seriously injured, and he claimed compensation under the Act. The Court held that he was not injured in the course of his employment, as his work was ended and he was outside the sphere of his employment at the time of the accident. This, however, did not mean that he might not have a remedy against his employers under the special agreement, but only that under the Act he had no claim. Although the decision proceeded on the above grounds, it may be noted that the Scotch Court of Session, in the case Murray *v.* Dowell & Co., Ltd., held that a man injured in an attack on the works where he was employed by strikers was not "injured by accident."

Disease.

In Martin *v.* Mayor, etc., of Manchester the applicant was a porter employed at a scarlet fever hospital. In February, suffering from influenza, he had been absent from work for a short time until March 22; on April 5 he contracted scarlet fever. On April 1 he had cleaned out the mortuary, but there was no evidence that the body of any fever patient had lain there shortly before that date. The County Court Judge held that he had contracted the fever in the mortuary, but the Court of Appeal held that there was no evidence of this, and as the particular time, place, and circumstances in which the disease was contracted remained unproved that the claim failed. This decision is based on two former cases, Brodrick *v.* London County Council (the *Builder*, September 5, 1908) and Eke *v.* Hart Dyke (the *Builder*, August 13, 1910). This question of disease, apart from the industrial diseases which are specially provided for in the Act of 1906, has been one of extreme difficulty ever since the decision in the House of Lords of the anthrax case, Brintons, Ltd. *v.* Turvey (the *Builder*, April 29, 1905), but the above cases have laid down a rough working rule which has now been acted upon for some time that a disease to be deemed "an injury by accident" must have its exact origin proved. The rule is by no means logical, and the difficulty has arisen from the wide interpretation given by the Courts to the words "injury by accident." In the case of a statute such as was the Workmen's Compensation Act of 1897, which imposed a new liability upon employers, it might have been expected that it would have been strictly construed, and that the argument would have prevailed that if the Legislature intended to include any kind of disease it would certainly have said so in no uncertain terms; but this has not been the case, and the artificial line created by decisions has now become firmly established.

Even industrial diseases have been dealt with in very obscure terms in the Act of 1906, which first specifically rendered such diseases the subject of compensation. The compensation is recoverable from the employer who last employed the workman during the twelve months previous to the date of his disablement from a scheduled disease. Then by sect. 8 *c* II. it is provided that if that employer alleges that the disease was in fact contracted whilst the workman was in the employment of some other employer that other employer may be made party to the arbitration, or if the disease is of such a nature as to be contracted by a gradual process, by sect. 8 *c* III. the employer sued may claim from other employers who have employed the workman in that character of employment a contribution towards the compensation payable. In the case of Mallinder *v.* J. Morris & Son, Ltd., a workman claimed against the respondents, his last employers, in respect of mercurial poisoning. The respondents disputed their liability, but also claimed contribution from another firm who had employed the man. The County Court Judge dismissed the other firm from the arbitration on the ground that the respondents had failed to prove that the disease was contracted whilst the man was in the other firm's service. The Court of Appeal allowed the respondents' appeal on the ground that under sect. 8 *c* III. it was not necessary to prove that point, as it would have been had the application been under sect. 8 *c* II. It will be seen that where a contribution is being sought under sect. 8 *c* III. what has to be proved is that the disease was such as to be contracted by a gradual process, and that the man during the previous twelve months had been employed by other firms in employment of a nature which would contribute to the disease. These cases are of especial importance to builders, decorators, etc., and for an informing decision on the section we may refer our readers to Haylett *v.* Vigor & Co. (the *Builder*, May 15, 1908).

Drunkenness.

The case of Frith *v.* Owners of the s.s. *Louisianian* may be shortly noted because it has an indirect bearing on a question which has caused much litigation. When does a workman come within the sphere of his employment? A seaman absent without leave was assisted on board, being intoxicated, just as the ship was leaving the quay. He was so drunk that he fell over the side and was drowned. In a claim by his dependents the County Court Judge held the accident to have arisen in the course of his employment, but the Court of Appeal set this aside. The man had reached the scene of his employment, but was not in a condition to resume his duties, and the accident was due, not to his employment, but to his condition.

Workmen Employed Abroad.

Contractors employing workmen abroad may be glad to be reminded that the Workmen's Compensation Act only applies within the territorial limits of the United Kingdom. This was first decided in the case of Tomalin *v.* Pearson & Son, Ltd. (the *Builder*, April 17, 1909), but it has recently again been affirmed by the Court of Appeal in the case of Schwartz *v.* India Rubber, Gutta-Percha, and Telegraph Works Company, Ltd., where a man proceeding at his employers' expense by sea to do some cable work in Teneriffe was lost with the ship on the high seas.

Notice of Accident.

It will be remembered that under the Act of 1906, although notice of an accident must be given as soon as practicable after the accident, its absence will not be a bar to the proceedings if it is found that the employer has not been prejudiced in his defence or that the want of notice was occasioned by mistake or other reasonable cause, sect. 2 (*a*). In Egerton *v.* Moore a navvy employed in excavating a trench on July 21, 1910, slipped and struck his breast with his pick. With but a short interval of a few days he continued working for various employers, until May 25, 1911, at full wages. He had not suffered from his breast except a little swelling and intermittent pain until March, 1911, when swelling recommenced, and a tubercular abscess began to form, which compelled him to suspend work, May 25. In June the man informed the respondents that he had been ordered to the infirmary, but no claim for compensation was made until July, 1911. The Court of Appeal held that notice of claim was not given as soon as practicable, and that the failure to make a claim was not occasioned by mistake or other reasonable cause. Ignorance of the Act was held in Roles *v.* Pascall & Sons (the *Builder*, June 2, 1911) also not to constitute a mistake or reasonable cause.

Some other cases dealing with matters of practice will be noticed by us in a future article.

BUILDING NOTES FROM AUSTRALIA.

The building trade throughout Austral has had a very prosperous year. The c of labour and material has increased co siderably, but even this has not acted as detriment to building operations. Architec have a great many prospective jobs in han but the difficulty is in getting satisfacto tenders. A leading architect at Sydn informed the writer that it is the unu thing now when calling for tenders to recei no response from builders, owing to the fa that most builders have their hands full. a often contracts in advance awaiting co mencement. Naturally property owners a very cautious about building, owing to t high prices ruling, but even the most cautio see no prospect of a fall in prices. Indeed, the face of it, it looks as if prices are the rise. A leading authority expressed t opinion a few weeks ago that two ye hence will show a rise of 20 per cent. on t present cost of building.

The high cost of building has a legitima origin. It is the outcome of increas population and prosperity. As far Australia generally is concerned, the develo ment is healthy, and is really only litt more than has existed for many years pa Australia is mainly dependent upon t export of primary products. The high pric ruling in the world's markets for these a responsible for prosperity, and as long high prices continue good times mu continue. In the Metropolitan area the co of buildings erected at Sydney during t last three years represents a sum of 15,000,000

The State as Landlord.

The increased cost of building, due to t high wages ruling for labour and materi has resulted in a great scarcity of house particularly at Sydney. These conditions a reflected in increased rents. To meet t position the Treasurer of New South Wal announces that he purposes covering 400 acr in the neighbourhood of Sydney with wor men's cottages. Owing to the impossibili of obtaining bricklayers and a sufficie number of bricks, the cottages will be wood, machine made. A start will be ma immediately with the project. A sum 18,000*l.* is set aside for the first instalmen The cottages will be on land 40 ft. by 180 f and it is expected that on 400 acres 5,0 people will be housed.

This scheme, the Government hope, wi prevent private property owners from i creasing rent of workmen's cottages, whi is the natural outcome of existing condition under which the demand is greater than t supply. The State will act as landlord ar charge the lowest rental possible. It mig be mentioned that wood houses, though n new to Sydney, are rarely built. Almost a dwellings erected of late years are of bric Wood houses are common at Melbourn Brisbane, and principal New Zealand town

A Commission was appointed recently New South Wales to inquire into the alleg shortage of labour existing in the State. T Chairman has issued a report, covering t progress of the inquiry as far as it deals wi certain trades. This report goes to sho that there is a great scarcity of labour in a the building trades, with the exception painting. The evidence given at the inquir went to show that the building trade generally handicapped by the scarcity labour. Mechanics in connexion with ever branch except painting are needed.

When the commissioner pointed out th the supply of painters seemed equal to t requirements he said that the painting trad was a notable exception. One of the reason assigned for this fact is that on new building the value of painters' work bears only slight proportion to the total cost. Th painter's turn generally comes a few yea after the building has been erected, and whe the interiors are to be painted and decorate It is interesting, however, to note that number of painters have come to Sydne during the last year. The Secretary of t

y Painters' Union informed the ers' Wages Board a week or two ago during the three months ending October, eighty painters had applied to the for employment who were new arrivals England, America, or New Zealand. have evidently all been absorbed. are no complaints about chronic un- yment, and employers state that they find employment for many additional

night interest readers of the *Builder* to what Australian employers think of h tradesmen. In some trades the h tradesman is at a slight discount, to the methods of work in England somewhat different from methods of in Australia. In the building trade, er, this is not so, or, if it is so, to only ht extent. English mechanics in the ng trades very soon adapt themselves to alian conditions. Some of the leading rs in Sydney stated recently that they their employment a number of English cotch tradesmen. Fully 60 per cent. se were found to be quite satisfactory, he remainder were slightly below the e in efficiency as compared with alians. Some employers praise the h tradesmen highly.

Painting Trade in Australia.

erally speaking, painting calls for less than other branches of the building hence painters' wages are generally than carpenters', bricklayers', masons', ers', and plumbers'. This is accounted the fact that the greater proportion rk is plain, requiring only a small t of skill. Specialists, or men who several branches are, however, just as and well paid as other members building trade. Sign writers' wages 6d. per hour, which is a higher rate hat paid to carpenters or plumbers.

trade in Australia is interested in the sion which is now going on in England nexion with the proposal to restrict the white-lead. As a rule, the Australian r and painter has no sympathy with vocates of white-lead prohibition. Lead ing is very rare here, though white- s a basis for paint is universally used. . G. Chapman, Demonstrator in Physi- at the University of Sydney, made a inquiry into the matter of lead ing among painters in the Common- . He showed that in 1908 deaths in Commonwealth from lead poisoning ered ten, which covered all occupations danger from lead poisoning existed, ing workers in the Broken Hill lead

Dr. Chapman said that the death of painters was a very average one. poisoning was the outcome of the an swallowing particles of lead dust. as doubtful whether lead could be ed by the unbroken skin. Lead did aporise, except at an enormous heat. ould not be carried in the fumes of ntine.

onic lead poisoning was largely ntable. Out of the patients he had ned for lead poisoning he had discovered of lead poisoning in about one in four. were unable to find traces of lead poison n the supposed sufferer from painter's he would conclude that the painter's ation had nothing to do with his illness people, he said, suffered from indiges and so forth. If they happened to be rs or plumbers they concluded they ead colic. It will be seen from this tial inquiry, that the danger from lead ing is a bogy, as far as the average r in Australia in concerned.

greater proportion of the material used painting trade in Australia is imported England. English white-lead, linseed arnishes, dry colours, and wall papers most exclusively used. Owing to the wood houses in many localities, the ption of paint is very great in propor- to the population. The competition English manufacturers for the trade nas become slightly keener during the ew years. This applies particularly to lead, oils, and varnishes. Until lately nd lead were mainly in the hands of rms, Messrs. Champion, Druce, & Co., n, and Messrs. Blundell, Spence, & Hull. Painters and architects pinned faith to Champion's lead and Blundell & e's oils. The reason for this was that these firms were the first to realise the importance of this market and the value of consistency in the matter of quality. Of late years, however, there has been more enterprise put into the white-lead and linseed oil trade. Several leading English makers are now doing business here, and it is no longer assumed that in each case only one name stands for the genuine article. In Queensland zinc white is used to a greater extent than in any other State. But it is not used by itself, because under such conditions it usually behaves badly.

In varnishes there is much more competition, but here also one firm (Messrs. Wm. Harland & Son) have held, and still hold, the leading position. There are, of course, other firms doing a very large trade. In painters' stainers an English firm do the leading trade in first quality material.

In water paints the market may be said to be almost untouched. Messrs. Sisson Brcs., Hull, appear to do the principal trade. Their product is the most widely advertised. In mixed paint there is not a very large trade done, except in one instance, where a leading English firm are represented by a pushing firm which enjoys a good connexion with painters and decorators. A mistake appears to have been made by some agents of English mixed paints passing by the painting and decorating trades and trying to sell their materials direct to the public. They have thus practically entered into competition with local painters by encouraging outsiders to do their own painting. The more successful policy seems to have been that of inducing the painter to take up the material. It might be added that many English firms frequently fail to make headway in these markets, owing to their being represented by agents who are out of touch with the trade. An agent requires to be one who is familiar with the trade, and does not confine his attention to one centre only. It is customary in some cases for the manufacturer to stipulate when giving an exclusive agency that the agent shall order annually goods to a fixed minimum value. Cases are not unknown where firms have taken the agency for a particular line in order to block its sale, especially when it threatens to compete with a line which they already handle.

Great expansion has taken place in the wall-paper trade in Australia during the last five or six years. Formerly, outside a few firms, the materials handled were commonplace in quality and design. Now, owing to the English manufacturers giving more attention to these markets, there is a much higher grade of goods in demand In a few cases the handling of wall papers is made a special business, but in the majority of cases it is a department of the oil and colour trade. Outside English goods there is very little wall paper imported into Australia.

LABOUR IN THE BUILDING TRADE.

THERE has been no recent development in reference to the trouble in the building trade, and the next step will probably follow the reply made by the London Master Builders' Association to the demands formulated by the Amalgamated Society of Carpenters and Joiners. The workmen are asking for an increase in wages, consequent on the increase in the cost of living, a reduction of the summer hours of working, and double pay for overtime. Mr. Costigan, Secretary of the London Master Builders' Association, states that the Committee, to which the men's representations had been referred, would meet shortly.

A mass meeting of London woodworkers connected with the trade was held on Clapham Common on the 14th inst., in support of the movement for securing higher wages and shorter hours of labour. A resolution welcoming the joint trade movement which had brought the carpenters, joiners, and cabinet-makers together was proposed by Mr. C. H. Young, of the Associated Society of Carpenters and Joiners, seconded by Mr. A. W. Raynor, London District Secretary of the General Union of Carpenters and Joiners, and supported by Mr. Bramley, Organising Secretary of the National Amalgamated Furnishing Trades' Association, Mr. Stennett, London District Secretary of the Amalgamated Society of Carpenters and Joiners, and other speakers. It was contended on behalf of the men that they had not had an increase of wages for twelve years, although during that period the purchasing power of the sovereign had fallen from twenty shillings to fifteen. Mr. Bramley said that the latest development was that the masons, whose union was one of the most cautious in the country, had determined to throw in their lot with them, as had the four unions of labourers. The labourers were a powerful factor, for if they stopped work, building would have to cease. They also had the support of the smiths and fitters. If they asked for shorter hours, forty-seven hours a week instead of fifty during thirty-nine weeks of the year, it was that they aimed at diminishing the number of the unemployed, which was particularly large in the building trade. It was for the same reason that they wanted double pay for overtime, as employers would, if that point were carried, do away with overtime altogether. The resolution was carried.

The *Morning Post* states that the Provisional Committee formed for the purpose of consolidating the seventy-two trade unions in the building industries has issued a circular pointing out that at present no general movement in the building trades is possible, the arrangements of the various sections being in conflict. Each trade union has its own agreement with the employers; some unions, the Carpenters and Joiners, for instance, have to give six months' notice of their wish to terminate an agreement with the employers. This gives the employers an advantage in preparing to meet any action on the part of the men. The circular continues:—"Sectional unionism will not do. To win a strike we must stop production. Therefore we must act together. We must form one union for the building industry, and let the friendly society exist entirely separate from the fighting organisation. We all work together on the building, and all take our part in production. As the master compels us to work amicably together for his benefit, why should we not work together for our own? Let us organise on the sound lines of industrial unionism, and so better our conditions here and now, and win for ourselves more freedom, shorter hours, and higher wages. Let us organise upon the lines of industry instead of craft. What is more, upon class lines, recognising that the masters, as a class, are organised against us. The industrial unionism must come and will come," concludes the circular, "and with it a greater share of the wealth we produce, and realisation of the joy of living." The movement for amalgamation is being urged forward with a view to its success, if possible, for the middle of May, as early in May it is proposed to submit the new programme of improved conditions to the trade employers.

By the end of this month, says the *Manchester Guardian*, the Manchester and Salford area, besides other parts of the country, will be involved, unless present negotiations come to a favourable end. Since the establishment of Conciliation Boards in 1904 the relations which have subsisted between local employers and working carpenters and joiners have been of a friendly character. In accordance with their working agreement, six months' notice has been necessary to effect any new regulation; notice has been given, and it will expire on May 1. In November last the Amalgamated Society of Carpenters and Joiners, having within the Manchester area a membership of about 2,500, joined with the locally less numerous General Union of Carpenters and Joiners in an application to the Manchester Association of the Lancashire, Cheshire, and North Wales Building Trades Employers' Federation in a request for higher wages. It is some years since any advance has been made in the rate of pay for Manchester joiners, and it was felt that they should apply for a rearrangement of their working rules. Hitherto the rate of wages has been 9½d. an hour, and it is asked that this should be raised to 10½d. an hour. It may be noted that in London, where the higher cost of living has always been recognised, the rate is now 10½d., and the carpenters and joiners there are asking that the pay should be raised to 1s. an hour. Bricklayers and masons are parties also to the working agreement, and thus the greatest groups in the building trade are intimately concerned in the progress of the present negotiations. Should there be a failure to agree, the Conciliation scheme provides, of course, for submitting the matter in dispute to other means of settlement before the trouble can be said to have become acute, and May 1 may possibly see the first stage in an amicable settlement. Otherwise the building industry will be involved in a very serious dispute. The employers in Manchester (so far as this area is concerned) are generally regarded by the employed as reasonable and well disposed in dealing with the question of rates of pay, and on the part of the workers it appears to be held by a large body that a mutual agreement may be arrived at before the Conciliation

Board steps in at all. The development of the question will, however, be looked forward to with a degree of anxiety.

The trade unions in the building trade have, it is stated, agreed to meet this week in London to consider the formation of a body which shall include all unions admitting men employed in the building industry. Seventeen unions have signified their intention of being represented. The bricklayers will submit the following resolutions to the Conference:—

"That this Conference expresses its adherence to the resolutions passed by the last Trade Union Congresses embodying the principle of amalgamating the present trade unions in the various industries, and therefore we, the representatives of the building trade unions, consider the time now opportune to put the principle into operation in our industry"; and "That a Committee from this Conference to consist of one member from each society represented be appointed to draw up a scheme to give effect to the previous resolution, such scheme to be submitted to the next Conference."

IPSWICH BUILDING TRADES ASSOCIATION.

THE annual dinner of the Ipswich Building Trades Association was held recently at the Crown and Anchor Hotel, when the President (Mr. B. Bird) occupied the chair. The loyal and patriotic toasts having been honoured, and the toast of "The Mayor and Corporation of Ipswich" submitted (proposed by Mr. R. Smith and acknowledged by the Mayor and Mr. F. Brown), Mr. E. Catchpole proposed the toast of "The Town and Trade of Ipswich."

Mr. S. A. Kenney, in response, said that the time had come when business was going to be better, because the large firms were sending out feelers into all parts of the world, and the orders were coming home, which could only result in prosperity for the working classes, and thus, naturally, the builders would benefit. One of the worst factors they had to deal with was co-operation, which was worse than a worm at the root of a plant to the people of the country. Private businesses were being crushed, and he was sure that there were many of the smaller trades which would be killed. Still, they could not help it, because the working men were quite at liberty to buy their goods where they liked. In conclusion, he urged builders to take up another trade to tide them over the quiet times during the year. There was, he believed, a great future for Ipswich; but competition must not be so keen as it had been in the past.

Mr. C. E. Whitmarsh next proposed the toast of "Success to the Ipswich Building Trades Association," and said there was co-operation of several kinds, but in the building trades there were broad outlines in which agreement might be reached without interfering with the individuality of the man, because, however close they might draw rules in any Association, they would find that the individuality of the person must be allowed for. There was one way in which they could co-operate, and that was in the raising of prices to a living limit, because at present it was all work and no profit. The trade engaged the second largest body of men in the country, next to the cotton trade, but in no trade was the profit so little in comparison with the wages paid, and it was on lines similar to these that associations such as theirs could do a great deal of good. To use the language of the day, it was time the builders struck for a minimum profit.

Mr. A. Sadler, who was called upon to respond, said that the Association was a useful institution, and worthy of more support than it got. They had made some little change during the last year or two in introducing other subjects than purely business matters, educational subjects connected with the trade, very interesting and very instructive to all, and they were finding that they were of great assistance, helping them to take a keener interest in their work.

Mr. E. E. Saunders, who also responded, said that at one time it looked as though the Association would fall through, but the widening of its basis to bring in kindred trades had given it a new lease of life.

Mr. A. W. Warner proposed the toast of "The President and Officers."

Mr. Buckingham Bird, in response, said that in the course of another week he would have been closely connected with the trade for fifty years, and during the whole time the trade had never been properly recompensed. It required a great deal of hard work, time, experience, and tact, and those qualifications should be properly paid.

Mr. E. P. Tetsall, as ex-President, thanked the Association for the way they had supported him during his term of office. He appealed to the outside builder to come in and help the Association to carry on its good work.

Mr. C. Borrett, Hon. Secretary and Treasurer, said that financially the Association was in a good position.

Mr. F. Grimwood gave the toast of "The Visitors," which was responded to by Mr. Frank Mason, Mr. T. B. Read, and Mr. W. C. Clark.

GENERAL BUILDING NEWS.

NEW CHURCH AND SCHOOL, BRANKSOME.

The Branksome Primitive Methodists are to have a church and schoolroom erected at an estimated cost of 1,200*l*. Messrs. Corbin, Harris, & Son are the architects for the work, and the contract is being carried out by Messrs. Mills & Sons, of West Southbourne.

TOWN HALL, CHADDERTON.

This new building is to be erected at a cost of about 10,000*l*. from the designs of Messrs. Taylor & Simister, architects. The exterior of the building is designed to give a broad and strong treatment of the English Renaissance, and the public hall provides accommodation for 564 persons.

STATUE TO CAPTAIN COOK.

The memorial statue of Captain Cook, which was originally suggested by Sir Joseph Carruthers, ex-Premier of New South Wales, is to be erected shortly near the new Admiralty buildings in the Mall. The memorial is the work of Sir Thomas Brock, R.A., and will cost upwards of 3,000*l*.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Devizes Hospital, Devizes.

The hospital, Riverton, New Zealand, is being supplied with Shorland's double-fronted patent Manchester stoves with descending smoke flues, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ARBROATH.—Conversion of corn exchange and market buildings into entertainment hall (1,600*l*.); Mr. James Simpson, builder, Arbroath.

Barrow-in-Furness. — Additions to police buildings; Mr. A. Race, Surveyor, Town Hall, Barrow.

Braintree.—Baths (527*l*.); Messrs. A. Brown & Sons, builders, Braintree.

Bredbury.—Extensions to works, Redhouse-lane, for Messrs. Pollock & McNab.

Burnley.—Weaving shed, Burnley-lane, for Messrs. A. R. Stuttard, Ltd.

Caister.—Post-office, near Green Gate; H.M. Office of Works, Storey's-gate, Westminster, S.W.

Chapelton.—Additions and alterations to school (4,000*l*.); Port Glasgow School Board.

Conway.—Rebuilding Guildhall; Mr. F. A. Delemotte, Surveyor, Town Hall, Conway.

Cuckfield (Sussex).—Houses, London-lane; Mr. A. Croucher, Surveyor, Council Offices, Cuckfield.

Doncaster.—Business premises, High-street (2,335*l*.); Messrs. C. Sprakes & Sons, builders, 37, East Laithgate, Doncaster.

Grantham.—School (200 places), south end of town; Mr. A. H. Malin, Secretary, Education Committee, Town Hall, Grantham.

Grays. Proposed enlargement of school, Arthur street (2,290*l*.); Mr. J. H. Nichols, Secretary, Education Committee, Essex County Council, County Buildings, Chelmsford.

Hadley.—Buildings, Angel-street; Mr. A. Hunt, architect, Bury St. Edmunds.

Hanley.—School (425*l*.); Alnwick Foundry and Engineering Company, Ltd., builders, Alnwick

Hanwell.—Alterations to free library (650*l*.); Mr. W. J. Dickens, builder, 19, The Broadway, Ealing.

Haywards Heath.—Additions at Brighton Asylum (2,500*l*.); Mr. Henry Tillstone, Surveyor, Town Hall, Brighton.

Honley.—Additions to Grove Mills for Messrs. Littlewood, Ltd.

Horbury.—Ironfoundry, Horbury Junction, for Messrs. C. Roberts & Co., Ltd.

Hove.—A plan has been passed for four houses, Marine-avenue, for Mr. A. Horlock. Mr. F. Newman, on behalf of Mr. T. Barnard, has lodged plans for six houses in Langdale-road.

* See also our list of Competitions, Contracts, etc., on another page.

Ipswich.—Diesel engine works for the Co... solidated Diesel Engine Manufacturers, Ltd... 179, Queen Victoria-street, E.C.

Kilbowie. Workshop for Messrs. J. & ... Tullis, engineers, Kilbowie.

Lancaster.—Warehouse, Ashton-road, ... Messrs. T. Preston & Son.

Leeds. Alterations to Town Hall (1,650*l*.... Messrs. Perkin & Bulmer, architects, Centr... Bank-chambers, Toronto street, Leeds.

Leek.—Shop, Picton-street, for the Leek a... Moorlands Co-operative Society, Ltd.

Lewes.—School (5,415*l*.); Messrs. Fra... Sandell & Sons, builders, Worthing.

Linton.—Weaving shed for the Linton M... Company.

Lincoln.—Plans have been passed for ... houses in Sausthorpe and Henry streets ... Mr. R. W. Parkinson, and for six houses ... Smith-street for Mr. F. W. Horton.

Lowestoft.—Plans have been passed ... follows:—Seven houses, Denmark-road, ... Mr. W. Brown; rebuilding, store, Chri... church-square, for Messrs. E. Wills & So... thirteen houses, Worthing-road, for Messr... Mobbs Brothers; four houses, Sussex roa... for Mr. R. A. Burrett. A plan has be... lodged for four houses, Horn-hill, by M... H. J. Eastaugh.

Maghull.—Epileptic colony for the Sele... Vestry, Liverpool.

Newry.—Artisans' dwelling, Kiln-stre... (4,785*l*.); Mr. J. Graham, builder, Dromore.

Norfolk.—Proposed schools at Bacto... (1,380*l*.), Crostwick (700*l*.), Freethorpe (1,360*l*.... and Little Walsingham (2,615*l*.), also enlarg... ments at Cley School (340*l*.), Elsing Sche... (570*l*.), and Hingham School (700*l*.); M... W. V. Bushell, Secretary, Education Co... mittee, Norfolk County Council, County Buil... ings, Norwich.

Reed.—School (fifty places); Mr. U. ... Smith, Surveyor, Herts County Council, Ha... field.

Sheffield.—Extensions, sanatorium (665*l*.... Mr. A. E. Booker, Clerk, Guardians' Offic... Sheffield. Extensions, motor garage (515*l*.... also fifty-three houses and two houses a... shops, High Wincobank Estate (9,060*l*.); M... F. E. P. Edwards, City Architect, Town Ha... Sheffield. Co., Ltd.; four houses, Babur-road, for Messr... Coupe Brothers; seven houses, Graham a... Hangingwater roads, for Mr. James Samue... additions and alterations to premises, Co... ridge and Stovin roads, for the Brightsi... and Carbrook Co-operative Society, Ltd... three houses, Walkley-terrace, for Mr. Smit... six houses, Staniforth-road, for Mr. Thom... Kershaw; additions, school, Stubbin-lane, ... the Trustees, Firth Park United Methodi... Church.

Shefford.—Chapel (1,815*l*.): Mr. C. Wrig... builder, Langford

Sheringham.—School, etc. (8,610*l*.); M... James Needs, builder, Fakenham.

Shettleston.—Building, Pettigrew-street, ... Shettleston Co-operative Society, Ltd.

Southampton.—Plans have been passed f... additions rear of Nos. 9, Manor Farm-ro... and 123 and 124, St. Mary's-road, store, M... brook road, and six houses, Ampthill-road, ... Messrs. Weston & Burnett; also for twel... houses, Newcombe-road, for Mr. F. J. Pau...

Stepps.—Church, corner of Blenheim a... Anniesland avenues, for the Trustees of ... United Free Church, Stepps.

Stoke-on-Trent.—School (17,100*l*.); Mr. ... Godwin, builder, Victoria-road, Hanley.

Stretford.—Plans have been passed ... twelve houses, Thomas-street, etc., for M... Thomas Hames, and for works, Trafford Par... for the Northen Counties Transport, Ltd.

Thorpe.—Twelve houses (1,935*l*.); Mr. W. ... Tarrant, builder, Byfleet.

Twickenham.—A plan has been passed f... additions to "Holly Lodge," Grosvenor-roa... for Mr. W. J. Reid.

Walsall.—Boiler house, etc. (650*l*.); M... John Taylor, Surveyor, Town Hall, Walsall.

Wanstead.—Enlargement of fire-station; M... C. H. Bressey, Surveyor, Council Offic... Wanstead.

Yeovil.—Plans have been passed for fi... houses, St. Michael's-avenue, for Messr... Pippard & Purchase; also for a warehouse ... Vicarage-street for Mr. Trask.

THE SURVEYORS' INSTITUTION:

THE COST OF LABOUR.

At the ordinary general meeting of the Surveyors' Institution, held on Monday, Mr. R. M. Kearns read a paper on "The Cost of Labour in Connexion with the Erection and Maintenance of Buildings," of which the following is an abstract :—

"Building contractors and their doughty foremen are splendid organisers and controllers of labour; consequently the cost of erecting a building is reduced as nearly as possible to the minimum in the case of the lump-sum contract.

A salient point is that the contractor, in the absence of any special arrangement to the contrary, stands to gain or lose on the amount of his estimate, no matter what fluctuations may take place in the wages rates of the workmen. In equity, however—putting aside the question as to what should happen in the case of a decrease—it would appear that some allowance should be made to the contractor when he is compelled to make a rise in wages under the force of circumstances which could not be foreseen before the date of his tender.

This allowance would have to be arrived at by ascertaining in the first place the value of the measured work executed after the rise in wages takes effect, and then adding a percentage on the proportion of the cost of labour, differentiating between mechanics and labourers. In this matter every contract should, of course, be dealt with on its own merits, as the proportionate value of labour to materials and plant varies in each trade according to the nature of the materials and the architect's designs. The following proportions might apply to ordinary public buildings or first-class residences :—

Trade.	Approximate Proportion of the Cost of Materials and Plant.	Approximate Proportion of the Cost of Labour.	
		Mechanics.	Labourers.
	Per Cent.	Per Cent.	Per Cent.
Bricklayer ...	67	24	9
Mason ...	40	55	5
Slater ...	80	15	5
Carpenter ...	70	27	3
Joiner ...	37	62	1
Smith ...	80	15	5
Plumber ...	75	16	9
Plasterer ...	45	41	14
Glazier ...	85	15	—
Painter ...	40	56	4

In reinforced concrete buildings the cost of labour is something between 50 and 60 per cent. of the total cost of the structural work, as compared with an approximate 30 per cent. in the case of ordinary brick and stone buildings. There is very little difference between the cost of the finished reinforced concrete and that of brickwork, bulk for bulk; and the great saving effected by building in reinforced concrete is, of course, due to the extraordinary thinness which is permissible in walls, piers, etc.

A brief reference may perhaps be made here, for the benefit of prospective building owners, to certain recognised rules governing the cost of both labour and materials—rules which, if followed, will place the uninitiated in a fair way to obtain an estimate approximating to the minimum cost of any proposed new building, and also enable him to have the works carried out for a sum within a reasonable margin of the estimated amount :—

1. Employ a properly-qualified architect who, while being a successful man, can yet give personal attention to his work.
2. Provide for compliance with the requirements of the Building Act or of the local authorities, and respect the legal rights of adjoining owners.
3. Specify, if possible, the use of local building materials, and thus save the cost of carriage and at the same time derive the utmost value from local labour.
4. See that bills of quantities are prepared by a properly-qualified surveyor.
5. The building owner's exact and final requirements should be embodied in the architect's drawings and specification before they are handed to the quantity surveyor.
6. Obtain tenders from builders of sound financial standing and of good reputation.
7. The builder should be called upon under the terms of the contract to make good all damage caused to the building or to adjoining property; to insure against loss by fire and provide for all risks and responsibilities enforced by the various Acts of Parliament; and to pay such wages as are generally accepted as current in each trade for competent workmen.
8. Employ a clerk of the works whose integrity and other qualifications are undoubted, and pay him a salary worthy of his position of trust.
9. Avoid variations; they are expensive, and usually prevent the works being completed within the period specified in the contract.

With reference to the responsibilities enforced by the different Acts of Parliament, I understand that the coming Insurance Act will in no way alter the law relating to accidents, and that therefore contractors will continue to insure against injuries to their workmen as before.

As to the responsibility for the payment of fair wages, I may refer here to a circular which was issued to various Councils in September last by the Local Government Board, setting forth the clauses recommended for general use in Government contracts by the Fair Wages Advisory Committee.

There is little that is new in the modern system by which the payment of fair wages is encouraged by the State. As you are aware, wages were at one time regulated in England by Acts of Parliament, and, according to Froude, with excellent results. It is recorded in his "Reign of Henry VIII." that the working classes of this country were "in a condition more than prosperous." The wages at that time were fixed "at a maximum," but it appears that this point of the law was not rigidly enforced, and at a later date a sliding scale was introduced. Froude refers to it as follows :—

"On the one side Parliament interfered to protect employers against their labourers; but it was equally determined that employers should not be allowed to abuse their opportunities; and this directly appears from the 4th of the 5th of Elizabeth, by which, on the most trifling appearance of a depreciation in the currency, it was declared that the labouring man could no longer live on the wages assigned to him by the Act of Henry, and a sliding scale was instituted by which for the future wages should be adjusted to the price of food."

I must now deal with my subject so far as it relates to the maintenance of buildings.

Whatever may be the defects which are discovered in the form of contract under which a building is erected, the costs and penalties of such defects are confined as a rule to that particular building; but in contracts for works connected with the maintenance and repairs of the numerous buildings under the control of Government Departments, County Councils, and other public bodies the matter becomes more serious on account of the recurrent nature of the work and the consequent necessity of meeting with equal recurrence during the period which each contract is in force the costs resulting from errors in the agreed terms or prices.

My mission is to point out that day work, although inevitable, should be restricted as much as possible, and in no instance should the cost be allowed to exceed 50 per cent. of the average annual expenditure. A case was recently brought to my notice in which various works of maintenance were carried out for a certain department under a schedule at a cost of about 4,400*l.*, and of this total the day work charges did not amount to 5 per cent. No doubt this is an unusually low percentage, but it shows what may be done under proper management.

Surveyors and clerks of the works have to be very wide-awake if they wish to hold their own in a maintenance contract, for builders seize every opportunity to do what may be termed "good business"; and they are not to be blamed, except when "good business" leads to "sharp practice" and "sharp practice" to actual dishonesty. Thus, in falling into the line of least resistance, it sometimes comes about that orders are given for work to be executed as day work instead of measured work.

Day work calls for no measuring on the part of the surveyor and ensures peace and quietness for both sides, the employers and employed. The only drawback is the extra cost. Experience proves, however, that this extra cost is a serious item; indeed, it may be taken as a well-attested fact that decorative works, repairs, and alterations connected with a maintenance account cost from 50 to 100 per cent. more if executed as day work instead of measured work.

I am told, however, that it is possible to get work executed as cheaply by day work as by measured work; and I admit that it is possible, but only if the day work were performed by a picked group of conscientious men, properly supervised, and that the prices for "materials" were in correct proportion to the prices for "materials and labour in fixing." The possibility is, however, somewhat remote, especially in connexion with large contracts carried out for public bodies; for it is well known that men do not work so strenuously for the latter as for private individuals.

The proper examination of the contractor's accounts is highly necessary if the expenditure on works of maintenance carried out for public bodies is to be controlled and kept within the required limits.

Efficient examination will reduce expenditure, while inefficient examination, which is always quickly recognised by the contractors, will increase it.

For the benefit of some of the junior members of the profession I venture to name the following rules which should be borne in mind when examining day work accounts :—

1. Watch the proportion of charges for labour and materials.
2. When examining the weekly vouchers note the names of the workmen and the total number of hours charged per day in respect of each man.
3. See that the materials charged for are not in excess of what was required for the work.
4. See that there are no items in the day work accounts which are also charged for in the measured work accounts.
5. See that ample descriptions of the work done by the different men employed in day work are given on the weekly vouchers.
6. Obtain separate vouchers and accounts in connexion with all special works, in order that the cost may be compared with the estimated amounts.
7. In checking the prices of items which are not in the schedule do not be influenced by "sporting charges."

Although in following such rules as the foregoing the total amount of any particular batch of accounts may not be reduced to any large extent, the moral force of the surveyor's queries and investigations would be very far-reaching and of inestimable value to his employers.

The cost of labour in connexion with maintenance frequently becomes abnormal owing to want of forethought and a "penny wise, pound foolish" policy adopted in the construction of buildings.

The want of forethought to which I have referred is frequently apparent from foundations to roof, and nearly always in the treatment and placing of water pipes and cisterns.

It has been stated in an article in an evening paper of February last, when the plumbers were greatly in demand, that "it is only in England that the young tendrils of lead piping twine in peril of the first frost." Poetical, but doubtless true!

Cisterns, too (the indispensable vitals of a building), are frequently exposed to frost and fixed in queer spaces under the roof, where they are inaccessible to any tenant who is not an accomplished gymnast or contortionist. Then, again, leading to the roof space there is the trap-door, which is frequently of mean dimensions, and when a new cistern is required it is found impossible to put one of sufficient size through the opening, rendering it necessary to cut away

ceiling joists and lath and plaster work, and afterwards make good at considerable cost.

Landlords, however, are not all deficient in forethought. Many years ago I met one who had certainly exercised the faculty for the benefit of his tenants. I was negotiating with the object of renting a small house in the country, and while on the spot I raised a question as to the cost of emptying the cesspool—one of those abominations which are still to be found in this XXth century—and the landlord informed me, in a sort of stage whisper, that the cost would be merely a trifling sum, as he had run "an overflow drain from the cesspool to the ditch on the other side of the hedge."

ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

The following is an abstract of a paper read at a meeting of the Institution on "The Works for the Water Supply of Birmingham from Mid-Wales," by Messrs. E. L. Mansergh and W. L. Mansergh, MM.Inst.C.E. :

The Elan supply scheme was originated in 1890 by the late Mr. James Mansergh, F.R.S., M.Inst.C.E., in consequence of the inadequacy of the then existing sources. These, consisting of five local streams and six wells in the new red sandstone, had proved insufficient to meet the needs of the City and district, which then had a population of about 648,000. Investigation having shown that no extension of the local sources would be satisfactory, the Welsh scheme was laid before Parliament in the session of 1892, and the necessary powers were obtained. The watershed of the Elan and Claerwen, which is situated in Radnorshire and Breconshire, has a gross area of about 71 sq. miles, and a mean rainfall of 65 in. The collectable rainfall is estimated by the authors at 37 in., giving an average yield of 102 million gallons per diem. The first instalment only, that is, works for the supply of 25 million gallons per day at Birmingham, and the prescribed quantity of compensation water to the river, namely, 27 million gallons per day, has at present been constructed : but the powers granted cover the full utilisation of the yield of the watershed and works necessary for a total supply of 75 million gallons per day to the City and district.

Three reservoirs have been constructed –the Caban Cöch, which is a combined supply and compensation reservoir, containing 7,815 million gallons, with a dam 122 ft. high ; Pen-y-gareg, for supply only, containing 1,330 million gallons, with a dam 123 ft. high ; and Craig Göch, also for supply only, of 2,000 million gallons, with a dam 120 ft. high. These reservoirs are all on the River Elan, and three more on the Claerwen are contemplated when the demand for water justifies their construction. For one of the latter—the Dol-y-mynach reservoir—the foundations and lower part of the dam have been already built in order to get the work above flood-level of the Caban Cöch reservoir. A submerged dam has also been constructed in Caban Cöch reservoir to maintain such a water level as will charge the aqueduct to Birmingham. From the Claerwen Valley a tunnel has been driven connecting it with the latter reservoir above this submerged dam, in order to bring into supply the dry-weather flow of that river.

The compensation water which has to be discharged into the river day by day in a regular flow has been utilised to produce water under pressure to work a large number of valves in connexion with the Caban Cöch dam and the valve-tower at the head of the aqueduct, and also electricity for lighting and power purposes. The latter is required at the head of the aqueduct in connexion with an installation of roughing-filters, which had to be made in order to free the water from germs which elsewhere had been found to cause deposit in cast-iron pipes. A short permanent line of railway was constructed from the Mid-Wales Railway near Rhayader to the lowest dam, and while the works were in progress some 36 miles of main line and sidings were constantly in use. In addition, a number of ancillary works, such as roads, bridges, culverts, etc., were constructed on the watershed.

The aqueduct, which is nearly 74 miles in length, consists of two main classes of work—conduit in tunnel or cut and cover, and steel or cast-iron pipes under pressure crossing valleys. There are fifteen tunnels with an aggregate length of 12¾ miles, and the cut-and-cover conduit is about 23¾ miles in length. The inverted siphons, of which there are eleven in all, have an aggregate length of nearly 36¾ miles, and the pressures to which they are subject range between about 25 lb. and 250 lb. per square inch. The pipes in the siphons are for the most part of cast-iron, but for pressures over 400 ft. of head welded steel pipes were used. Out of an ultimate total of six lines in each siphon two only have been laid for the first instalment. The ruling gradient for the conduits, which are haystack-shaped, approximately 8 ft. by 8 ft., is 1 in 4,000, and that for the pipe siphons is 1 in 1,760.

At the heads of all the siphons rather elaborate automatic arrangements are made to cut off the water in case of a pipe bursting, and also at the outlet ends to prevent water flowing back under similar circumstances. Sluice-valves, air-valves, and washouts of the usual description are provided on the lines of pipes. With a few exceptions the pipes are carried over all streams and rivers crossed, and this has involved the construction of several large bridges, the chief of which is at the crossing of the River Severn between Bewdley and Arley, where the river itself is spanned by a handsome steel arch of 150 ft. span.

The aqueduct terminates at the Frankley service-reservoir, about 6 miles to the south-west of the centre of the city. This reservoir, which holds a little over 200 million gallons, is semicircular in plan, divided into two segments, it is about 30 ft. deep, and is constructed of concrete lined with asphalt and blue brickwork. Eighteen ordinary slow sand filters, having an aggregate area of about 14 acres, have also been installed, as all the water is filtered before use. Although the top water level of the reservoir, 603 ft. above ordnance datum, is high enough to supply water to the greater part of the city and district by gravitation, for certain parts pumping had to be resorted to. A pumping station is, therefore, provided to raise water to two high-level service reservoirs, the one about ¾ mile to the south and the other about 3½ miles to the north of Frankley reservoir, each of about 1½ million gallons capacity.

The works in the valleys were carried out by direct administration, and the remainder by contract, and the total cost of the whole of the works, including land, was, in round figures, 5,750,000*l*.

The Concrete Institute.

A meeting of the Concrete Institute took place at Denison House, 296, Vauxhall Bridge-road, Westminster, S.W., on April 11, Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A., President, in the chair.

There were elected as members, Messrs. : – H. C. Forder, Westminster; P. L. Francis, Westminster, S.W. : H. Haughton, Westminster, S.W. ; C. B. Ife, Westminster, S.W. ; R. G. Lovell, A.R.I.B.A., Eastbourne ; T. de Courcy Meade, City Engineer, Manchester; E. Meredith, architect and surveyor, Llandrindod Wells ; J. E. Mundell, A.R.I.B.A., London, E.C. ; A. von Osenbruggen, Westminster, S.W. ; A. O. Pitt, Westminster, S.W. ; F. Radcliffe, Little Royd, Huddersfield ; W. C. Thorneley Westminster, S.W. ; B. C. Wheatcroft, Westminster, S.W.

A paper by Mr. Maurice Behar, Civil Engineer (Ecole des Ponts et Chaussees), M.C.I., entitled "The True Bending Moments of Beams with Various Degrees of Fixity," was submitted, of which the following is a synopsis : The object of this paper was to draw the attention of all those concerned with reinforced concrete to the disadvantages which would result from the application of certain theories and formulæ. Special attention was devoted to consideration of the various degrees of fixity of the beams, and examples were set forth in order to establish a comparison from an economical point of view and also from the point of view of safety between the various cases mentioned. Calculations concerning the verification of the strength and stability of beams, slabs, and pillars were given by the author, and special attention was given also to the question of ascertaining the position of the neutral axis in various cases. The paper was mostly of a mathematical character, and had for its principal object the eliciting of views of all those concerned in the design of reinforced concrete in a discussion upon all the subjects dealt with in the paper.

A discussion followed, in which the following took part :—Professor Henry Adams, M.Inst.C.E., M.C.I., R. W. Vawdrey, B.A., Assoc.M.Inst.C.E., M.C.I., Ewart S. Andrews, B.Sc. (Eng.), M.C.I., Morgan E. Yeatman, M.A., M.Am.Soc.C.E., M.C.I., D. Webster Robertson, M.C.I., Herbert E. Steinberg, Assoc.M.Inst.C.E., M.C.I., E. Fiande Etchells, F.Phys.Soc.M.Math.A., A.M.I.Mech.E., M.C.I., and the President.

THE ARCHITECTS' BENEVOLENT SOCIETY.

THE sixty-second annual general meeting of the Architects' Benevolent Society was held on the 11th inst. at the Royal Institute of British Architects. Sir Ernest George, A.R.A., occupied the chair, and among those present were Mr. Guy Dawber, Mr. W. L. Spiers, Mr. Lewis Solomon, Mr. W. Hilton Nash, Mr. A. Saxon Snell, Mr. Edwin T. Hall, and Mr. R. Dircks. In the absence of the Hon. Secretary (Mr. Percivall Currey), through illness, the Treasurer read the annual Report of the Council, as follows :—

"In submitting their sixty-second annual report the Council regret that they have again to record a diminution in the amount of the Society's subscriptions. The difference is small as compared with last year, but it is significant in view of the fact that a special letter of appeal was issued by the President in October to over five thousand architects practising in the United Kingdom. The result of the appeal, although scarcely realising anticipations, increased by new or additional subscriptions the total amount received by 41*l*. 18s. 6d., while the sum of 124*l*. 8s. 6d. was added to the Society's capital from donations received in response to the appeal. The Council feel that the number of contributors on the Society's books (the total number of subscribers is 512) is inadequately representative of so large a profession; they are also assured that the result of advertising, while extending knowledge of the Society, leads to an insufficient return for the expense incurred. It is felt, therefore, that the subscription list must mainly rely for its support upon the efforts of individual members and upon the corporate action of the metropolitan and provincial architectural societies. In this connexion the thanks of the Society are due to Mr. Watson Fothergill, the Local Honorary Secretary of the Nottingham Society of Architects, who secured numerous fresh contributions.

During the year the sum of 1,031*l*. was distributed in relief; 245*l*. being paid to pensioners, while 786*l*. was disbursed in grants among seventy-four applicants. A pension having become vacant, various applications were considered and the annuity was finally granted to the widow of an architect.

The total amount received in subscriptions was 707*l*. 5s. 6d. (as compared with 716*l*. 14s. received in 1910); while the amount received in donations was 295*l*. 14s. (as compared with 109*l*. 15s. received in 1910), including Professor Aitchison's bequest of 90*l*. Donations were also received as follows :—Sir Ernest George 20*l*. and 4*l*. ; Mr. Edgar Wood, 21*l*. ; Mr. Edward B. T'Anson, 15*l*. 15s. ; Mr. Arthur Ashbridge, 10*l*. 10s. ; Mr. Thomas Dinwiddy 10*l*. 10s. ; Mr. Archibald M. Dunn, 10*l*. ; Mr. John Belcher, 5*l*. 5s. ; Mr. John Borrowman 5*l*. 5s. ; Mr. F. W Foster, 5*l*. 5s. ; Mr. Banister Fletcher, 5*l*. 5s. ; Mr. Henry Lovegrove, 5*l*. 5s. ; Mr. W. Hilton Nash, 5*l*. 5s. ; as well as various smaller sums. With the amount carried forward from last account, together with the donations received during the year, the Council were enabled to increase the Society's investments by the purchase of 500*l*. Queensland 3 per cent. inscribed stock at a cost of 424*l*. 14s. 6d.

At the beginning of the present year the family of the late Mr. John T. Christopher presented, through Mr. Freville Christopher, 105*l*. New South Wales 3½ per cent. inscribed stock in memory of their father, who was himself a liberal benefactor of the Society.

It is with great regret that the Council have to record the death of Mr. William Glover and Mr. T. M. Rickman, the two Vice-Presidents of the Society. Mr. Rickman had been a subscriber since 1872; he served on the Council on many occasions, and always took an unfailing interest in its work. The association of Mr. Glover was more recent, but since he came to live in the South of England he took an active part in the progress of the Society, generously contributing himself and influencing the contributions of others, greatly to the advantage of both income and capital.

The following, being the five senior members, retire by rotation from the Council :—Mr. Charles Blomfield, Mr. John Borrowman, Mr. C. R. Baker King, Sir Charles Nicholson, and Mr. G. E. Bond. To fill the vacancies caused by these retirements the Council have the

re to nominate Mr. Henry Lovegrove, . Arden Minty, Mr. Rowland Plumbe, William Woodward, and the President of ciety of Architects.

Council have the pleasure to nominate Henry L. Florence for election as Vice-lent.

thanks of the Society are due to the Institute of British Architects for office modation and to the staff of the Institute sistance, always cordially rendered, in atter connected with the Society."

e Chairman, in moving the adoption of eport, announced numerous recent dona- including a legacy of 200*l.*, free of from the late Mr. T. M. Rickman, and rom the Society of Architects.

e Council for the ensuing year of office elected as follows :

ne President—the President of the .A.: Vice-President—Mr. Henry L. nce. Sir A. Brumwell Thomas, Mr. r Cave, Mr F. W. Hunt, Mr. Reginald Roumieu, Mr. Lewis Solomon, Mr. T. E. att, Mr. George Hubbard, Mr. E. B. on. Mr. A. Saxon Snell, Mr. W. L. s, Mr. Henry Lovegrove, Mr. E. Arden r, Mr. Rowland Plumbe, Mr. William ward, and the President of the Society chitects."

the motion of Mr. Lewis Solomon, ded by Mr. Henry Lovegrove, Mr. W. n Nash was thanked for his past ces, and re-elected as Hon. Treasurer.

. Nash, in acknowledging his re-elec- said that he would like to see a larger ription list. The response to the t letter of appeal of the Presi- (Mr. Leonard Stokes) had scarcely ered expectations. The number of s on the Society did not diminish year ar, and he hoped that all architects who afford to do so would contribute to a ty which sought to alleviate the necessi- f their poorer brethren.

. Percivall Currey was re-elected Hon. tary, and a resolution expressing sym- with him in his illness was unanimously ed.

. C. H. Brodie and Mr. Henry Love- were thanked for their services as ors.

ilar compliments having been paid to rnest George for presiding, and to Mr. s for his work on behalf of the Society, eeting terminated.

BOOKS.

Legislation, 1909 *to* 1911. Being a Col- ion of Provisions contained in Private ts of Parliament obtained by Provincial rporations and Urban District Councils England and Wales after Consideration the Local Legislation Committee of the use of Commons. Compiled and arranged Frank Noel Keen, LL.B., Barrister-at- w, with an Introduction by Sir Charles cholson, Bart., M.P. (London : Walter uthwood & Co. 1912. Pp. 340. 5s.)

n interesting Introduction to this work, harles Nicholson points out the import- art which the local legislation passed rivate Bill procedure takes in the forma- of the general law of the country. A private measure, he says, which proves ssful in some provincial centre may be ded to other areas, and finally the iples it embodies may obtain universal ion in the form of a Public Statute. his evolution of the law Sir Charles ins the important functions performed hat is now known as the Local Legisla- Committee of the House of Commons. ever this may be, the drawback attend- ll Private Bill procedure is the lack of city given to legislation of this character the difficulty of obtaining Private Acts eference and of appreciating the trend of enactments, and the author of this work lone something to obviate this objection. reats of the Private Acts obtained in Sessions 1909-11 inclusive, showing the of the legislation as procured by the us local authorities. He points out in Preface that, of course, he has only ded Acts or sections of Acts which are me general interest, or which partake e nature of Government regulations, but xcluded those relating to purely local ers or temporary in their application.

The work is divided into fifteen parts, with paragraphs in each part. Each part indicates the general subject-matter treated of, whilst the paragraphs show the effect of the Acts upon various branches of the subject-matter, and there is an index—so reference is made easy. The terms of the sections of the Acts are set out, but the reference to the Acts are given thus : "Chiswick, 1911, sect. 81." For general purposes the form of reference may prove sufficient, but for future editions we may suggest that possibly a reference to the chapters of the Acts referred to might be useful. We make this suggestion because we imagine that this work will prove especially acceptable to the clerks of the various local authorities, and an exact reference to the Acts which they may wish to procure would even enhance its value.

The publication of this volume may assist in a codification of local laws, which is an end to be desired, besides providing information which at present it is difficult to obtain, and possibly it may prove the first of an annual or triennial compilation of local private legislation.

The Workmen's Compensation Act, 1906, *with Notes, Rules, Orders, and Regulations.* By W. Addington Willis, LL.B. (London), Barrister-at-Law. Twelfth Edition. (London : Butterworth & Co.; Shaw & Sons. 1912. Pp. 358. 5s. net.)

We are not surprised to see that Mr. Willis has found it necessary to issue a further edition of his work upon workmen's compensation—the third edition which has appeared since the Act of 1906 first came into force. This is one of the most condensed treatises on the subject which we know of, but efficiency has in no way been sacrificed to brevity, and the author offers the legal profession and the general public a thoroughly practical handbook on this complicated branch of law in a most handy form and at an extraordinarily low price. In this edition the English and Irish decisions are brought into line down to January 6 of this year, and the Scottish decisions to December 20, 1911. We remember that in former editions the author expressed the opinion that the Act of 1906 would sweep away many of the incongruities created by the former statutes, but it has certainly not done away with the necessity of litigation, and in his Preface the author states that 153 new decisions have had to be noted since the appearance of his last edition in November, 1910. In this edition the index has been revised, and there is a note on the National Insurance Act. One of the provisions of the Insurance Act relieves the Insurance Fund from paying insurance to persons who are incapacitated by accident or sickness when they are in receipt of, or could take proceedings to recover, compensation under the Workmen's Compensation Act of an amount equal to, or greater than, the insurance benefit in repsect of such incapacity or sickness.

There is every reason to believe that this twelfth edition of this work will prove as popular and useful as its predecessors.

Butterworth's Workmen's Compensation Cases. Vol. V. Quarterly Advance Sheets, Part I. 1912. Edited by Douglas Knocker, Barrister-at-Law. London : Butterworth & Co. 1912. 195 pp. 7s. 6d.)

This volume of advance sheets forms the commencement of Volume V. of "Butterworth's Workmen's Compensation Cases," New Series, and it is a comment on this branch of the law that this first part contains some seventy-four decisions of the House of Lords and the Court of Appeal, all of which were delivered between October and November, 1911. The litigation under the new Act of 1906 shows no signs of diminishing, and the general public owe the textbook writers a debt of gratitude for the means they provide of unravelling the intricacies of an Act of Parliament. These advance sheets at the earliest possible date provide an authoritative report of the latest decisions, and their usefulness has been abundantly demonstrated.

Practical Sewerage and Sewage Disposal. By H. C. H. Shenton, F.S.E., etc. (London : Edgecumbe Rogers. Pp 148, Illustrations 12. 3s. 6d. net.)

Into a very small space Mr. Shenton has contrived to compress a large amount of information and practical advice, and his book will prove itself valuable both as an excellent introduction to the problems of sewage conveyance and disposal and, not infrequently, as a book of reference for the practising engineer. The author's aim throughout has been to eliminate all purely theoretical matter having no directly practical bearing on his subject, and to confine himself to a thoroughly practical consideration of the problems ordinarily encountered in designing sewerage works. Commencing with a careful summary of the factors governing the laying out of a new system, several chapters are devoted to the geological character of the ground, the sites available for outfalls, and the methods of crossing rivers and valleys, etc., and useful notes are included as to the data required by the engineer and the legal method of procedure. The design, construction, and maintenance of the ordinary types of sewers are considered, and the various accessories, such as access chambers, syphons, and lifting apparatus are fully described. The question of disposal is dealt with in the later part of the book, and the alternative systems and appliances are dealt with from an eminently practical standpoint.

Pocket Notes and Remembrancer for Sanitary Inspectors, etc. By J. T. Cowderoy. (London : The Sanitary Publishing Company, Ltd. Pp. 135. 2s. net.)

The fourth edition of this book has recently been published, and the author has subjected it to considerable revision in order to bring it into line with recent legislation and litigation, and to add sundry notes and helps which will doubtless often prove serviceable. The greatest difficulty in compiling a handbook of this kind is to so classify and index the contents that the information desired can be quickly traced; the arrangement of the matter is in this case all that could be wished for, and we are not surprised that previous editions have proved popular.

The subjects dealt with are extremely varied, ranging from the allotment of burial-ground to a list of slang terms used in the cattle trade, and including notes on the inspector's duty in regard to unhealthy dwellings, public nuisances, powers of entry of premises, the provisions of the Town Planning and the Childrens Acts, cattle diseases, and so on. We can warmly commend the book to those who are entrusted with the duty of safeguarding the public health.

The Precise Calculation of Pipe, Drain, and Sewer Dimensions. By C. E. Houseden. (London : Longmans, Green, & Co. Pp. 53, Illustrations 4. 2s. 6d. net.)

The purpose of the book is to provide engineers and sanitary contractors with the necesary formulæ and tables arranged in a convenient form for making precise calculations as to the flow of liquids in pipes and sewers, thus enabling them to make use of the smallest and therefore the most economical sections. A number of examples are given typical of various classes of work to illustrate the use of the formulæ and tables, and some useful additional technical information is given in appendix form.

Infectious Diseases and their Preventive Treatment. By E. C. Seaton, M.D. (University of London Press. 1911. 7s. 6d. net. Pp. 210.)

This is a work for the use of county, borough, and district councils, joint hospital boards, other public bodies, and their officials, and it deals with phthisis, scarlet fever, diphtheria, typhoid fever, and smallpox. The procedure for notification and isolation is considered in detail, and the influence of the legislation of recent years is indicated by numerous statistical diagrams. It does not deal in detail with questions of hospital design, but points out, in the chapter on public health organisation, some of the main essentials in the way of water supply and sewage disposal, housing, and other social demands.

Building Construction and Architectural Drawing. By JOHN A. REID. (London and Glasgow: Blackie & Son. 4s. net.)

THIS is a portfolio containing some eighteen plates, showing the details of customary sound building construction, reproduced for the most part to ¼-in. scale. The drawing is careful, thorough, and clear, and the notes are in printing of unexceptionable quality—a point of much importance, since those who use the portfolio will tend to adopt its style. The notes accompanying the portfolio and explaining the plates are concentrated but adequate, and avoid the dulness and prolixity and the tendency to make a long story of a very simple business, which is so often found in books on construction. The pamphlet of works is prefaced by Mr. F. H. Newbery, the Director of the Glasgow School of Art, warmly commending Mr. Reid, an old pupil, and now an instructor in the School. Though the production is intended, we gather, primarily for the apprentices of the various trades, we can confidently recommend it to architectural students and to the professors and demonstrators of architectural schools as an exceedingly handy (and moderately-priced) elbow manual.

LEGAL COLUMN.

The London Building Act: Government Buildings.

The case of Dellar Brothers *v.* Drury, reported at length in our columns last week, raised an important question under the London Building Act, 1894. The Territorial Forces Association employed Messrs. Dellar to erect an iron shed on a piece of land according to plans approved by an officer of the Association. It was admitted that the building infringed the provisions of the London Building Act. On March 28 Messrs. Dellar served a building notice on the respondent, the District Surveyor for Westminster. On March 31 the respondent served a notice of irregularity on Messrs. Dellar, under sect. 151. As this notice was not complied with, a summons under sect. 153 was applied for on April 5. This summons did not come on for hearing until July 20, when the magistrate made an order that Messrs. Dellar should comply with the notice, but stated a special case for decision by the Divisional Court. The magistrate found that the building was vested in the Territorial Association on April 5, and occupied by them a few weeks later. The question to be decided was whether the building came under the exemption contained in sect. 202. by a misprint quoted in our report as sect. 22. This exemption is as follows:—"Every building structure or work vested in and in the occupation of her Majesty, her heirs and successors, either beneficially or as part of the hereditary revenues of the Crown, or in trust for the public service, or for public services," shall be exempted from so much of the Act as relates to buildings and structures.

It does not seem to have been contended that the Territorial Association did not come within this exemption, the contention being that at the time the summons was issued the building was not vested in and in the occupation of the Association, and at that time Messrs. Dellar were not servants of the Crown. The Court held that what had to be regarded was not the date of the summons, but the date of the order, and as at the date of the order, July 20, the Crown was in occupation of the building, the magistrate had no power then to issue an order under sect. 153 for demolishing the building.

The decision appears not free from difficulty, as ordinarily the date of an offence is that which is regarded, not the date of an order dealing with that offence; but the circumstances of the case are unusual.

LONDON COUNCILS.

Finchley.—Application is to be made to the Local Government Board for sanction to borrow 1,650*l.* for the erection of a convenience at Tally-Ho, and tenders are to be invited for the work. The following plans have been passed:—Alliance Estates and Development Company, eighteen houses, Woodhouse-road; Metropolitan Tramways Company, additions, tramway depôt, Woodberry-grove; Mr. W. Peachy, seven houses, Etchingham Park-road.

Friern Barnet.—The Local Government Board are to be asked to sanction a loan for the making-up of Hollyfield-avenue.

Heston and Isleworth.—The Education Committee have approved sketch plans prepared by the Borough Surveyor for the erection of a school to accommodate 800 children.

Richmond.—At the last meeting of the Council plans were approved for the construction of a surface water sewer in Kew-road at an estimated cost of 960*l.*

Southwark.—Plans have been lodged with the London County Council for the erection of a building in Orange-street by Messrs. F. J. Eedle & Myers, 3, Railway-approach, London Bridge, S.E.

TRADE CATALOGUES.

Among the cleverest adaptations of reinforced concrete is the Keppler patent system for pavement, roof, floor, and stallboard lights. "Ferro-Glass," as it is named, is described and illustrated in a leaflet which Messrs. J. A. King & Co., of 181, Queen Victoria-street, have recently sent us. In place of glass prisms fixed in cast or wrought iron frames, the expansion and contraction of which causes internal stresses in the glass, the prisms under the new system are supported by concrete beams, reinforced by a single steel rod. By the old method a certain proportion of the light was intercepted by the iron parts projecting at the side and below each rib; each tile in the "Ferro-Glass" system is so shaped as to overlap and cover the lower portion of the rib. The lower side of the light can thus be cleaned with great facility, offering, as it does, one continuous surface, and, of course, no painting is required as in the case of iron-framed lights of the ordinary description, there being no exposed metal to rust. Roof lights constructed on this system have the great advantage that they lie in the same plane on the roof, and do not form any angles, in which snow and rain water can collect and cause leakage. "Ferro-Glass" has great bearing capacity, and is offered at very favourable prices. It has been adopted at the Houses of Parliament, Somerset House, Messrs. Whiteley's new premises in Queen's-road, W., the Hotel Cecil, and many other important buildings in London and the provinces.

"Ronuk," Ltd., of 16, South Molton-street, London, W., Portslade, and Manchester, send us a leaflet dealing with the well-known sanitary polish manufactured by them. "Ronuk" has been used for some years as a floor polish by many of the large hospitals and public institutions, and has received the approbation and patronage of leading and medical authorities. It is also regularly used in the Royal Palace, and in a large number of private houses and mansions in town and country. By its use scrubbing and the resulting dampness are dispensed with, and the pores of the wood are filled up, a hard, bright, durable surface being formed, in which germs can find no harbouring, and which can be cleansed and kept in order with little labour and cost. The company contract for the maintenance of the polished flooring at the National Gallery, the National Portrait Gallery, Hertford House, the Tate Gallery, St. Bartholomew's Hospital, King's College Hospital, St. Mary's Hospital, St. George's Hospital, etc. Similar contracts may be entered into in the case of private houses.

PATENTS.

APPLICATIONS PUBLISHED *

21,937 of 1910.—William Alexander Harrison: Roller blinds or awnings.

7,062 of 1911.—Ralph John Seager Smith: Fastening or holder for doors, casements, and other hinged or pivoted lights and ventilators.

9,356 of 1911.—L. G. Mouchel & Partners, Ltd., and Harry William Towse: Pile foundations.

9,835 of 1911.—George Mahlik: Cowl for chimneys and ventilating flues.

11,157 of 1911.—James Keith: Method and system of ventilation.

11,870 of 1911.—Giuseppe Andina and John William Bottomley: Continuous kilns for burning or firing bricks, tiles, or other earthenware, fireclay, or like goods.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

14,252 of 1911.—Hermann Jost: Ma marble-like patterns on smooth transpa plates.

FOREIGN AND COLONIAL.

Building Material, Argentine Republic.

The *Boletin Oficial* of March 4 contains a decree awarding to Sres. Bonneu, Ibero, Parodi y Figini, a contract for the construction of two warehouses in the port of Buenos Aires. The cost of the work is put at 478,000 pesos (about 42,000*l.*).

Building Material, Laboratory Equipment, etc., Morocco.

H.M. Consul-General at Tangier (Mr. H. E. White, C.M.G.) reports that the French Government have now granted a sum of 50,000 francs (10,000*l.*) for completing the construction and fitting-up of a Pasteur Institute at Tangier which was commenced some time ago, but was left unfinished through lack of funds. The building is to be fitted up with laboratories for carrying on experiments and making analyses in all branches of agriculture, mineralogy, etc., as well as in purely medical work, preparation of serums, etc.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address in either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

Fuel Cost and Heating Efficiency.

The large increase in the price of fuel greatly accentuates the importance of tracting the full calorific value from the coal or coke used for heating purposes a matter closely affecting the owners and occupiers of all classes of office ildings, factories, shop premises, and private houses.

IDEAL RADIATORS & IDEAL BOILERS

For warming houses, flats hotels shops, public buildings, etc. by hot water or steam.

The economy of central heating is now generally admitted, but the selection of suitable appliances for the generation and distribution of the heat requires careful consideration if the best results are to be obtained.

The specification by Architects and Engineers of Ideal Boilers and Ideal Radiators for Low Pressure Hot Water and Steam Systems ensures the use of a product which is based on scientific knowledge and more than 30 years' experience—a product made from the best materials, enjoying a world-wide reputation for reliability, efficiency, adaptability, and simplicity of design, construction, and operation.

If you have not our current catalogue we shall be pleased to send a copy gratis and post free.

THE BRITISH SCHOOL AT ROME.

ALL those who have so worthily striven towards the formation of the British School at Rome may heartily congratulated on the success their efforts. The announcement that Royal Charter has been granted for the omotion of the study of archæology, tory, and letters, architecture, paint-, sculpture, and the allied arts, rks a definite step forward in the vancement of architecture in this untry.

While continuing the archæological d other researches hitherto carried on the Old British School at Rome, the arter provides also for the establish-nt of a hostel, general library, and idios, and for the awarding of scholar-ips and other forms of assistance to idents in connexion therewith. Pro-ion is also made for four Faculties—., Archæology, History, and Letters; chitecture; Painting; and Sculpture; and for such others as the Council shall from time to time determine.

This Council, as provided by Article II., is to consist principally of members nominated by various public bodies, and appears to be so constituted as to ensure a minimum of three architects, one to be appointed by the Royal Academy and two by the Royal Institute of British Architects. With the exception of the Royal Society of British Sculptors, however, there is evidently no reason why any of the other bodies concerned should not appoint architects to represent them or why architects should not be co-opted under the terms of Clause 6. Indeed, the Royal Scottish Academy and the Royal Hibernian Academy by the appointment of Mr. J. J. Burnet and Sir Thomas Deane create a precedent which may possibly be followed by other authorities in the future. The first Council thus comes into existence with five architect members, including, in addition to those already mentioned, Sir Aston Webb, appointed by the Royal Academy, and Mr. Reginald Blomfield and Mr. J. W. Simpson, appointed by the Institute. This selection is, we think, fairly representative, and will no doubt be considered generally satisfactory. The inclusion of two architects to serve on the Executive Committee with two painters and two sculptors, giving six artists out of a total of fifteen, may be considered reasonable so long as the present proportion remains, but should it be deemed necessary to increase this number we hope the representation of the various arts will be increased in proportion.

Everyone interested in the future of architecture, while seeing in this announcement much cause for gratification, must realise that the future usefulness of the School will largely depend on the wisdom and foresight of those

entrusted with the preliminary organisation. So much will depend on approaching the subject from the right point of view, so that the School may be established on the right lines. Considering the present unsatisfactory and even chaotic condition of our educational methods, it appears evident that it will be wiser to organise this School once and for all on ideal lines to which our educational methods will by degrees adjust themselves rather than to attempt to adjust the School to meet present-day conditions. These, we hope and believe, are but temporary, and even now in process of an improvement which will bring them more into line with continental and international opinion.

This, we imagine, is, for the students of this country, one of the great advantages of this School. Situated as we are, on an island on the Western fringe of the continent, it has been our fate all through the centuries that witnessed the growth of Western civilisation to be far removed from the great centres of European thought and culture. Whatever success we may have achieved has been rather the success of individuals than of schools; and through it all it has been only the men of the rarest mental equipment who have succeeded in freeing themselves from the taint of provincialism and in lifting themselves up to that height from which alone an international outlook is possible.

Although in our old university towns we possess centres of thought and of culture, whose value we would not for one moment wish to belittle, yet we have nothing comparable to the great international centres of Europe for the exercise of just the influence which is so necessary to widen the mental and spiritual horizon, and to quicken the sympathy and insight of the young artist; nothing that brings him into touch in quite the same way with the keenest minds and most forceful personalities of other countries, so enabling him to realise the limitations of his national outlook, and to find his own level from an international standpoint.

Whatever advantages Paris may possess in helping the student to find his own level, her chief value is in the acquisition of the technique of art. In this respect she is universally recognised as the leading school; but for the acquisition of culture Rome is supreme.

It is, we imagine, for this latter purpose that the British School at Rome is intended. Not as a school of technique, but of general culture. Not a classroom in which to study the principles of architecture, but a cloister in which to meditate on their application. To ensure to the student just leaving the schools a period of quiet and a breathing-time in which he may assimilate his knowledge and under the gracious influence of such an incomparable environment and in sympathetic communion with the most gifted minds of all nationalities may gradually find himself and the place of his art in the scheme of existence.

In order to reap the full advantage of such an opportunity and to hold his own with the picked men of the Beaux-Arts and other foreign schools, it is evidently necessary that the English student should take with him a very complete technical equipment. At the first start, no doubt, this will prove a difficulty, as it is idle to pretend that our Gold Medallists from the Academy or other picked students from any other of our schools can be for one moment compared in this respect to the winners of the Grand Prix de Rome or to the selected students of Germany or America.

Although there may at first be a danger that inferiority of technical knowledge and an insular outlook may tend towards isolation and to the maintenance of those provincial characteristics which it should be one of the principal objects of such a school to soften or eradicate, yet it may, we think, be confidently anticipated that as the School gradually gets into touch with the Villa Medici and the Villa Aurelia the natural desire to be on equal terms with their occupants will lead to a demand for a higher standard of education, and so exercise an uplifting influence on our schools at home and bring them more into touch with the best that is known and thought in the world.

It is this friendly intercourse with students of other nationalities which we are inclined to think even more important and more advantageous to the English student than all the art treasures or the historic associations of Rome.

In the cultivation and maintenance of a sympathetic understanding with the representatives of foreign countries much will naturally depend on the personnel of those selected as heads of the various Faculties. We are confident that every effort will be made to secure a wise selection, and that under competent guidance a brilliant future is assured for the British School at Rome.

HOSPITAL CRITICISM.

THE severe and outspoken criticisms on the buildings of the Sheffield Royal Hospital contained in an article contributed by Sir Henry Burdett to a recent number of the *Hospital* were dealt with at the last quarterly meeting of the Royal Hospital Board. A Special Committee, which was appointed to investigate the matter, satisfied itself as to the unwarranted character of many of the allegations, just one-half of the statements being found to be absolutely contrary to fact. As to the others, which were true to a greater or less extent, some were said to be of little importance and others a matter of opinion.

Everyone will freely admit the value, even the necessity, of criticism, however severe and outspoken, and we are quite sure no architect would resent it provided it is well-informed and true in substance and in fact. Judging from the report of the Special Committee, this criticism is neither, and is therefore to be deprecated.

Sir Henry Burdett's interest in hospitals is well known, and no one would question his *bona fides*. We can only imagine therefore that, as far as the matters of fact are concerned, the suggestion of the Committee that his inspection of the Royal Hospital "was very imperfectly performed, or that amidst the number of institutions visited his memory of details has failed him, or his notes have been accidentally misplaced," accounts for so many misstatements.

As to the matters of opinion, with all respect to Sir Henry Burdett's knowledge of the subject, a layman's opinion can hardly be accepted as the last word on hospital construction, as distinct from its administration, nor as to the best way to lay-out a hospital on a given site to avoid waste of space and subsequent cost of upkeep. As the Committee considers that a better plan for utilising the available space would be difficult to suggest, the two lay opinions on this point may be left to cancel one another.

Whatever value there may be in the point of view Sir Henry Burdett puts forward on matters of construction, it must be remembered that medical science is rapidly advancing and that opinions based upon it change from year to year and that it would, we think, be rather difficult to obtain a general consensus of opinion from medical men and hospital administration on more than the general outlines of the lay-out or construction of hospitals.

But in any event it hardly seems fair to make remarks which might be taken to infer that those employed to design any particular hospital are not competent unless the statement can be substantiated by facts which do not meet with instant contradiction.

It is generally recognised that the best results in hospital construction can only be obtained by intelligent and cordial co-operation between those who administer them and those who design them. Such regrettable incidents as this will hardly tend to promote it, unless mistakes honestly made are candidly admitted.

NOTES.

The Institute Drawings. THE paper read at the Institute on Monday evening was illustrated by original drawings dating from the early XVIth century down to those by Wm. Eden Nesfield. In the subsequent discussion the question arose as to whether the Institute or the Victoria and Albert Museum were the more fitting permanent home for architectural drawings. Mr. Strange, of South Kensington, manfully supported the case for the Institution which he serves: but the general feeling of the meeting was, so far as we could gather, in favour of housing them at Conduit-street. Architectural drawings are a thing apart, and rarely interest the larger public who visit museums. The Institute collection, already considerable, is steadily growing, and if the Council cannot enter into a purchasing competition with South Kensington, it can at any rate welcome gifts with equal pleasure. It is true that at present the accommodation at Conduit-street for collections of the sort is not wholly adequate; but the Institute is now in possession of large premises, and in the course of time this difficulty should not prove insurmountable. The Institute possesses one of the most complete architectural libraries in the world. It is a sort of Mecca for the travelling European scholar. The trusteeship of the Burlington-Devonshire collection of drawings has added to its renown. It is therefore valuable not only as a pecuniary asset, but also as a possession which increases the prestige of British architects abroad.

The Aftermath of the Strike. When the history of the coal strike comes to be written those capable of serious thought may well ask themselves two questions. (1) Was it worth it? (2) Is striking the best means of airing grievances and obtaining redress? It is impossible to gauge the loss of wages incurred by reason of the strike. Workpeople all over the country were affected, a period of improving trade was squandered, and work was driven out of the country. This much, however, can already be proved: the number of working days lost by the miners in March alone was 23,900,000. Take an extreme minimum wage of four shillings a day, and this represents a loss in wages in this trade alone of 4,780,000*l.*, and the sickness, provident, and other funds are depleted. During the whole of last year 931,000 workpeople were involved in disputes, and 10,247,100 working days were lost. This was bad enough, and compared with 908,538 workpeople and 9,722,800 working days in 1910; but the first three months of this year already exceed the figures for those bad years, as 1,094,855 workpeople have been involved in disputes and 27,867,400 working days have been lost. The trade of no country can long bear such a strain, and the workpeople themselves are the first as well as the last to suffer. They suffer months after a strike is terminated. When all is said and done everybody must now see that the miners' grievances were capable of being adjusted by peaceful measures; that minimum wages in abnormal places would have been secured without a capital expenditure of nearly five million in wages.

The London Society. While no signs have been given of the corporate existence of the London Society, we have reason to believe that the enthusiastic meeting held in February last will be followed in due course by other indications of life. On such a question as the site for the London University the Society might express an opinion, while preparing itself for more general activity concerning the beauty and well-being of the metropolis. The sooner the executive show vigilance in the affairs of the moment the quicker will support be given by those who are hovering now on the brink of membership.

And the Cockburn Association. We may turn to Scotland for an object-lesson in the cause of conservation, architectural propriety, and city development. While various societies have been formed in London and have apparently become defunct, the Cockburn Association of Edinburgh has steadily maintained its influence. Lord Cockburn, who advocated in 1817 the "respectable and organised resistance of municipal power," wrote as follows:—"I do not mean to recommend perpetual agitation. What I want is to encourage the formation of correct opinions and of a right spirit over the community, so as to secure the existence of a general and intelligent attachment to what is essential to the City. If devotion to the beauty of their town was known to be a part of the nature of the inhabitants, it would operate preventively and would very rarely need to be called into action." To achieve such objects the Cockburn Association was instituted in 1875, the year following the publication of Lord Cockburn's "Memorials and Journals." The subscription for life is one guinea and for a year half-a-crown, the amounts being small in order to attract a large membership and so that public opinion may be fully represented. (The minimum subscription to the London Society—for Londoners—is one guinea per annum.) A list has been published showing the occasions on which the Cockburn Association has taken action in Edinburgh and the neighbourhood. The last recorded action is dated 1910, when Mowbray House in the High-street was purchased by public subscription organised by the Association.

Indian Native Craftsmen. Among the many problems which will arise during the development of Delhi as the Indian Capital none is of more interest than the question of tradition. It will be a great pity if those who have the subject to consider do not contrive to effect a happy combination between Eastern and Western ideas. We understand that Lord Hardinge is in favour of an Oriental style of architecture for the new Government Buildings, and, while it will doubtless be possible to evolve designs in sympathy with the local necessities, the native population must be prepared to concede much to the European advisers who have been called in to give the results of their knowledge of advanced methods of construction and of the principles of planning. But, whatever proposals may be made as regards design and planning, the enterprise will not be successfully carried out unless the native craftsmen of India are employed extensively in the execution of the buildings. That these craftsmen exist, possessed of insight into the past and equipped with individual resources uncommon among workmen in more "civilised" countries, is an established fact, and it will be to the credit of all concerned if they are given the opportunity to prove their skill.

The York House Water Gate. We must cordially endorse Miss Sophia Beale's suggestion that some of the original effect should be restored to the York House Water Gate by excavating the ground in front of it and forming a pond with aquatic plants and waterfowl. Ever since the construction of the Embankment this architectural gem has been shorn of its dignity by the raising of the surrounding levels, and we think the present suggestion for disengaging it so admirable that it only requires to be placed before the London County Council, whose sympathy with bygone London has been indicated in many instances, to secure its prompt adoption.

THE UNIVERSITY OF LONDON, GOLDSMITHS' COLLEGE.

At the Goldsmiths' College, New Cross, S.E., a number of short courses in engineering and building subjects are to be given during May and June. As these classes are not connected with any definite course, except as to surveying, any student may join any class. Further particulars will be found advertised in this issue.

THE EXHIBITION OF THE INTERNATIONAL SOCIETY.

The International Society would seem largely to restrict its exhibitions to the display of the work of French and English artists. The present show is a little inconsequential, but it is none the less interesting. We do not find, as other critics have found, any fault with the hanging. If the juxtaposition of one picture with another does not always appear quite logical, yet the walls are so little crowded that the relation of one picture to another is never obviously harmful. The exhibition is in its way rather an affair of threads and patches; it covers a large area of artistic effort, and it leaves the impression of a medley of patterns. But each pattern is individual, so individual indeed, so established by tradition and reputation, that the hanging, after all, matters little. A Millet, a Courtet, a Pissarro, a Manet, or a Monet cannot very well be crowded out, however multitudinous the other pictures. We cannot blame the International Society because they have not provided us with the highest masterpieces of these artists; that would probably be beyond the effort of any Society. In view of the reception of recent artistic manifestations it is a little difficult to understand the antagonism which Manet and the men of his day had to withstand or sink under. In Paris the most untamed *fauve* of to-day looks upon a Futurist picture and proclaims himself a classic. He proclaims it regretfully, be it said, and with an air of chastened regret. The contemporary reception of these older men, its wrong-headedness, would seem to have put fear into the hearts of later critics; to-day at least so far from condemning work which does not fall within a certain official category there is a tendency to rush to the other extreme, a desire even to welcome rubbish so long as it has a theory tacked on to it. However this may be, one of the outstanding features of the present exhibition is the work of Mr. Walter Greaves, two full-length portraits, for which places of honour have been found in the Octagon and Large Galleries. These portraits stand the test of their prominent placing they are dignified, sincere, and vital works. Neither trade booming nor critical depreciation (for we regret to observe that the merit of Mr. Greaves is only reluctantly conceded in certain quarters) can affect their direct and honest appeal to all unprejudiced persons. Mr. Greaves's art is wholesome in its sincerity and as remote as possible from the quick adaptiveness, the felicitous eclecticism, which has brought so much modern work into transitory prominence and fame. The two examples of Millet are certainly much below his best work, and do not suggest either in painting or feeling the joy which was his own in depicting the soil and the peasant of the soil. The two Ribots are more characteristic of the artist, and the Place du Théâtre Français of Pissarro is one of his most familiar works. What are we to say about Mr. Strang's portrait of Mr. Festing Jones? We like his processional picture, "Laughter," much better; it suggests that this artist's talent for precision and unvarnished statement might be usefully employed in a scheme which aims more particularly at decoration. Maurice Denis in "La Plage" occasions pretty much the same opposition in the mind of the spectator as Mr. Strang's "Laughter," although for quite opposite reasons. Both artists work under the spell of a more or less personal convention, and the insistence on the convention, in either case, becomes a little irritating. "The Mother's Kiss" of Carrière is a typical work in which we feel that the manner of the artist (the Carrière convention is sufficiently well known) assists the interpretation of the subject which could not be expressed so subtly in any other way. Mr. Alexander Jamieson shows in "La Pavillon Français, Trianon," one of

his finely vigorous compositions, which brings building, trees, and water into harmonious effect. The work of Gauguin, Alfred Stevens (the Belgian artist), Mr. Lavery, Mr. Charles Shannon, Mr. Ricketts, Mrs. Betty Fagan, and many other notable artists is represented at the exhibition.

THE ROYAL INSTITUTE LIBRARY AND SOME OF ITS CONTENTS.

THE usual fortnightly meeting of the Royal Institute of British Architects was held on Monday, at No. 9, Conduit-street, Mr. E. Guy Dawber, Vice-President, in the chair.

Deceased Members.

Mr. H. T. Hare, Hon. Secretary, said it was with regret he had to announce the decease of the following members:—Mr. Richard John Macbeth, elected a Fellow in 1906; Mr. John Bevan Phillips, Associate, elected in 1884; Mr. Henry Shackleton, Associate, elected 1906; and Mr. Edward Ashby Smith, Licentiate. Another matter which ought to be mentioned was the death of a distinguished architect, who, although not a member of that Institute, was known to many of them—he referred to Mr. E. A. Kent, of Buffalo, New York, who was lost on the *Titanic*. Mr. Kent was a frequent visitor to Europe, and was present at the last Congress, also at the Town Planning Congress, and at the Congress in Vienna. He was sure they would all feel that some expression of regret at his death ought to be transmitted to his sister, who was his only relative.

The Chairman said he would like to add just a word in regard to the sad death of Mr. Kent. There were a great many members of the Institute who knew him quite well. The deceased was the very best type of the American gentleman; he was very keen about his work, a great traveller, and deeply interested in English architecture, and he was sure they all felt the deepest sympathy with his sister.

The resolution was carried in silence.

The Chairman then formally welcomed Mr. Harold E. Moss and Mr. Richard B. Ling as Associates.

Mr. C. Harrison Townsend then read a paper on "The Royal Institute Library and Some of Its Contents," the following being an abstract:—

"We are happy in possessing a considerable number of original architectural drawings, either designs, or sketched or measured drawings of existing buildings, in many cases executed by men of note, and ranging from, say, Scamozzi, in the XVIth century, to Burges and Nesfield of our own time. Thinking that the very existence of much of this material must be unknown to most of us, it occurred to me that it might be useful to lay some of it before you to-night.

Belonging to the Salvin collection are five valuable sheets of drawings which, there is every reason to believe, are from the hand of Inigo Jones. Two of these represent a proscenium designed, in the one case, for the masque of "Juno's Court, 1633," and, in the other, for the "Queen's Masque of Indianos, 1634."* The latter of these was, however, I find, actually used for the performance of Davenant's Masque of the "Temple of Love," in 1635.

In the Crace Collection of "Views of Old London," in the British Museum, is a series of four prints engraved by Loggan, representing four triumphal arches thus described:—"Arches erected for the entry of King Charles into London on his Restoration, April 22, 1661." Of these we have in the Library the original drawings,* about the same size as the engravings, and executed in light ink, with an Indian ink wash, though the engravings vary somewhat from the originals.

We now come to a remarkable volume consisting of 120 drawings by some of those draughtsmen of the late XVIIth and early XVIIIth century, who, I am afraid, come within the category of those lately described by Professor Blomfield as "industrious builders of 'Châteaux d'Espagne,' indefatigable and unprofitable designers in the air."

In this we find some good drawings of a scenic and baroque design by Panini, known as a painter of the Campagna and of Roman ruins, by whom the Institute possesses an oil painting of the Colosseum on its walls in the Council Room. By Pierre Puget, who was not only an architect and a "great sculptor" (as he is termed by Mr. W. H. Ward), but a painter also, and was, on these three qualifications, called by his flattering admirers, in his own day, the "Michel-angelo of France," there are also some examples.

John Talman, son of the elder Talman, who designed Chatsworth for the first Duke of Devonshire, was an architect of considerable note in the early part of the XVIIIth century. Before practising he travelled to Rome with W. Kent, and in the present volume the outline views of the Rhine, the Danube, and the Wael bear his initials. It also contains some drawings in brown ink of stained glass in the church at Upton, the draughtsmanship of which shows a curiously good feeling for such work, considering the period (1708) of its execution.

In a folio volume of drawings of Whitehall Palace, an early owner, the Rev. George Mortimer, has inserted the following note:—"We have always been given to understand that these are the original drawings of Whitehall Palace." The book, however, contains manifestly the drawings made for Kent's edition of the works of Inigo Jones (1727) by Flitcroft, who was not only an accomplished and delicate draughtsman, as these pencil drawings show, but an architect of note in his day. It was he (and not Hawksmoor to whom it is usually assigned) who was the designer of St. Giles-in-the-Fields. The original drawings of R. Wood's "Ruins of Palmyra" and "Ruins of Balbec or Heliopolis" are contained in two large volumes of very laboriously careful sketches. The drawings, elaborated from Dawkins' roughe sketches, by J. P. Borra, are as we know them in Wood's volumes. The latter refers in the Balbec volume to Dawkins as having "made the sketches and measures" for the work.

In 1784 George Hadfield received the first gold medal for the travelling studentship at the Royal Academy. He made use of his tour abroad to make measurements and collect data for the restoration of the Temple of Fortune at Palestrina, or Prænestе, near Rome. He associated with himself in the work Sig. Colonna. The restoration scheme is shown in six beautifully-tinted drawings, one of which, full of minute detail, is no less than 8 ft. long. It is interesting to know, by-the-bye, that Hadfield may be further remembered as the architect of a considerable portion of the Capitol of Washington.

The Library possesses the original water-colour drawings by James Stuart from which the engravings were made for Stuart and Revitt's "Antiquities of Athens," and also a small volume of his sketches and MS. notes. The latter probably covers some of the ground of Stuart's visit, *viâ* Holland, to Rome in 1742, and contains fifty-five pages of sketches, in many cases landscapes, drawn, with some breadth and appreciation, in pen-and-ink.

There are in the Library nine large drawings by Hardwick—plans, elevations, and sections of the Pantheon from his own measurements. Another large volume by him is a scrapbook in which have been mounted sketches and measured drawings, most of which he made in 1778. These include several sheets of the west end of St. Peter's, the Colosseum, and the Villa Madama. This conscientious, but not very inspired, book is the work of the father of the better-known Philip Hardwick. He was a pupil of Chambers, and obtained, in 1768, the first silver medal offered at the Royal Academy for the class of architecture.

To those who are interested in the work of the late XVIIIth century, when the influence of the Adam brothers was supreme, the book of sketches of ornamental friezes from original models in the possession of Joseph Rose will appeal.

By Sir Robert Smirke (of whom, as you know, we possess a bust, which is in the Common Room) we have eleven large water-colour drawings, executed during his travels in Naples, Sicily, and Greece, between 1801 and 1805. These include a good drawing of the Temple at Ægina, labelled as the Temple of Zeus, but now identified as the Temple of Athene.

There is a volume by Henry Parke, an architect of the early XIXth century, whose name should be known to members of the Institute as the designer of the medal which was given by his brother-architects, in 1835, to Sir John Soane, and the use of which is allowed us annually for the Soane Medallion. Parke's widow presented these 500 and 600 drawings, which are the result of his tour through Italy, Sicily, Greece, and Egypt, in 1824. Many of his measured drawings were done in conjunction with his fellow-architect, Scoles, of whom there is a framed portrait on our walls.

One of the original founders of the Institute was John Goldicutt, who was born in 1793 and died in 1842. By him we possess about 300 sketches and 100 designs and projects of his own. Many of the sketches are of Pompeian decorative work, probably done for his "Specimens of Ancient Decorations from Pompeii," published in 1825. We have on the walls of the Institute one of his drawings of unusual interest. It is the very elaborate transverse section of St. Peter's, showing, with much careful expression, the decorations and

View of Court. By Panini.

paintings, and was submitted by Goldicutt to Pius VII. The Pope, in recognition of its merit, presented the artist with a special gold medal.

There is a volume of strongly-coloured drawings by George Wightwick (1802-1872), an extraordinarily voluminous author on things architectural. They are the originals of his "Select Views of the Roman Antiquities," lithographed by T. N. Baynes, and published in 1827, and are useful in showing us the unexcavated state of the Colosseum and the Forum. Another volume of his is a scrapbook of sketches, many of which are measured work done in Italy. We have a further volume to which Wightwick gives the somewhat imposing title of "My Liber Veritatis." It contains drawings of vases, and sketches in France and Venice, and also the rough sketches for the above work, and, finally, this most prolific of architectural draughtsmen has left behind him a huge collection of large and very vigorously-coloured drawings which had served to illustrate his many lectures.

A volume presented by Professor Donaldson, in 1864, contains some water-colour sketches, done between the years 1816 and 1819, by Joseph Woods, who, it is interesting to note, was a founder, in 1846, of the London Architectural Society, of which our Institute is the lineal descendant. The drawings are not very good, but those of the Treasury of Atreus and the Lion Gate at Mycenæ are interesting as showing us the buildings before their exhumation.

A curious series of sketch and note books—no less than sixteen volumes of closely-written and minutely-drawn notes—are the result of John Wolfe's three or four years of travel in Italy, Greece, and France in 1820. It was during this tour that he and Charles Barry became fellow-travellers, and began the intimate friendship which lasted through their life and is perpetuated in the name borne by Sir Charles Barry's son—our distinguished Honorary Associate, Sir John Wolfe Barry.

Of Elmes' work we have a large collection of drawings and designs and full-size and other details. There are, mostly drawn by his own hand, several interesting alternative treatments of St. George's Hall, both interior and exterior. Amongst his drawings are three large tinted perspectives (submitted in two cases in competition), but two of these, I think, evidently show the hand of Thomas Allom, whose vogue as a "perspective colourist" was so great in the middle of the last century. I take it that this is Elmes' competition design submitted for the Liverpool Assize Courts (p. 475).

The name of T. L. Donaldson seems to carry us very far back, for, though he only died three years before Nesfield, we have two volumes of sketches done in Greece and Rome as early as 1819 and 1821. Curiously enough, one of these is a large volume of sketches of Gothic work, to which one would not have imagined he had much leaning.

A donation to the Library by Mr. C. E. Sayer, made some three or four years ago, was a volume by Alexander Rocs. It contains many beautifully-executed little drawings of coloured decoration. Some forty or fifty of these are of Pompeian walls and ceilings, but, unfortunately, a large proportion of the remainder are without any indication as to their source.

Decimus Burton, the architect of the Wellington Arch, and a former Vice-President of the Institute, presented to the Library the year before he died (which was as recently as 1881) forty-two drawings of classic relief ornament, in one or marble, carved decoration of architraves, friezes, etc. They are drawn, and well drawn, on tinted paper in black crayon touched with white.

By William Burges we have three scrapbooks in which have been inserted drawings of original designs of stonework and of silver and goldsmith's work, domestic and ecclesiastic. The books dealing with goldsmiths' work contain designs of book-clasps and metal bindings, one mounted glass bottle, and a drawing of the equally well-known cup with the twenty-four grotesque animals on the rim. A later acquisition, through the generosity of Sir W. Emerson, is the pocket-book lately presented by him to the Institute. It consists of thirty-six vellum pages with sketches in brown ink, annotated in Burges' usual almost black-letter script, and still contains, interestingly enough, its own crowquill. The contents are most miscellaneous—animals, landscape notes in Italy, sketches at the theatre, and studies for portions of his own designs. There is an alternative design for the upper part of the tower for his proposed Law Courts, introducing, as features of the carved decoration, in his characteristic manner, the seasons, months, and planets.

There are four volumes of a modern architect whose influence on the architecture of our own time has, in the opinion of many, not yet been fully recognised. Some of the evidences of the amazing fertility known to many who, like myself, were brought into close contact with William Eden Nesfield are to be found in the four volumes of his sketches which the Institute possesses. One of these volumes—a scrap-book—gives an opportunity of tracing the development of his talent by sketches dating from 1846, when he was only eleven years old. It contains boyish drawings, eventually improving in merit as he profited by the teaching of J. D. Harding, many of whose characteristic strokes are to be noticed as corrections of his pupil's work. The third volume contains many English subjects, dating apparently from 1855 to 1858. But the fourth is a book of great interest, being mainly the material eventually utilised for the well-known book, "Specimens of Mediæval Architecture in France and Italy," published in 1862. The illustrations were drawn on the stone by Newman, and, though occasionally just a little hard in draughtsmanship, show the lithographs to be particularly faithful and accurate to the original.

In 1867 there were presented, through Professor Donaldson, by Texier himself (a Gold Medallist of the Institute in 1866), five volumes of sketches and details, in gold and colour, of mosques in Constantinople, one volume dealing specially with St. Sophia. To the latter Professor Lethaby refers in his "Sancta Sophia."

The volumes of Devey's sketches are somewhat disappointing. Not indeed that they are otherwise than beautifully drawn and touched with colour in quite a charming way, but that they happen to deal principally with one branch of his sketch material only. The majority of the drawings are of chimney-tops, and, though they cover a great deal of ground and comprise notes made of these throughout England and in Germany and Holland, the volumes are not of very great interest. There are, however, a few sketches of French towns, such as Harfleur, Rouen, etc.

A collection of very beautiful drawings is contained in two volumes, one of twelve sheets and the other of thirty-three, of the coloured decorations of Norfolk and Suffolk churches. The larger volume deals with the well-known series of screens, and the smaller containing principally roof decoration. These drawings, which were executed by G. Y. Wardle, with very charming feeling for his subjects, show a delicate and an accurate appreciation of the work of that great school of English art of the early XVIth century which has not yet received its meed of recognition."

Mr. R. Phené Spiers,

in proposing a vote of thanks to the author, said they were greatly indebted to Mr. Townsend, who had brought to their notice a very large number of drawings, only a few of which he (Mr. Spiers) was previously aware of. Some three or four years ago Mr. Townsend pressed him to undertake the same task, but he was pleased it had been left to that gentleman, because it had evidently been a great delight to him to get at the facts, and he had approached the subject in a slightly different form to what he (the speaker) would have done. The author commenced with John Shute's book, which was published in 1563. He (Mr. Spiers) remembered when the book was first brought into the Library, and he had consulted it very often since, and he had no doubt many other members had. He was very glad to hear that a facsimile of the book was going to be published so that it could be in the hands of every student. There was a great deal more information to be obtained from that work than could be obtained simply by looking at it in the Library. A few years later, in 1577, another book which became very famous was brought out by Jean De Vries, of Antwerp. He believed there was a copy of the work in South Kensington, and there was also one at the British Museum. Unfortunately, the Institute did not possess a copy. The author had referred to the South Kensington collection of architectural drawings, and had expressed the hope that the Victoria and Albert collection and their own might exist side by side without antagonism. The fact was, it was very difficult for the Institute to find places for specimens, and for that reason he had sent 1,400 sheets to South Kensington. If the Library was to be of the value it might be to students they must make some arrangement by which the collection could be separated and catalogued and be made easily accessible.

Mr. E. F. Strange

seconded the vote. He remarked that the Institute's collection was, to some extent, the same as that at South Kensington, which was under his (the speaker's) charge. Nothing had interested him more than the way in which the author had touched on all sorts of points in connection with the collection at South Kensington, which he hoped was now rapidly becoming of even much more than national importance. Reference was made to John Yenn, who worked with Chambers, and Mr. Townsend said he was unable to ascribe the drawings which were in the Institute to either of the two artists. If the author were to pay a visit to South Kensington he could clear that difficulty up. Last year they were fortunate enough to obtain a large number of drawings by John Yenn. Yenn, who towards the end of his life was the Treasurer of the Royal Academy, designed quite a large amount of furniture among other things. As far as he could ascertain, he never built a building of any importance, although he designed a great many villas; but he designed a great deal of furniture and a great deal of decoration. Mr. Townsend had referred to a very beautiful collection of drawings of East Anglian rood-screens by Wardle. He (Mr. Strange) did not know where the Institute obtained them from. It was an interesting point that at South Kensington they also had a very considerable number of those delightful drawings which he was commissioned to make by the old Museum in 1865, 1866, and 1867. Whether they did not go on employing him he did not know, but apparently he went on for his own pleasure, and made some more, which were now in the possession of the Institute. If the Institute felt inclined to be

Temple of Jupiter, Athens. From a Water-Colour Drawing by Sir Robert Smirke, in the Institute Collection.

D

generous and transfer them to his charge at South Kensington he would be extremely grateful. That question of early XVIth-century English decoration was an important one. He had tried to draw attention to it from time to time, and systematically at South Kensington during the last few years he had encouraged people to make very careful drawings of painted rood-screens which they had not got in the collection, and they had also bought what they could, by which means the collection was being steadily increased. There need be no question of any rivalry between the Institute and South Kensington. They did not desire to rival or to compete with anybody, but it was their plain duty to carefully inspect everything that was offered them and to go into the market and buy what they considered worth purchasing. They had the space to accommodate the drawings, which were catalogued and every one was topographically indexed, which was much more important to the student. Their topographical index at the present moment contained something over 40,000 references, and they could do for the Institute in the matter of architectural drawings far more than they could do for themselves, even if they spent as much money on their collection as did the authorities at South Kensington. It was creditable to the highest degree that the Institute should possess such an important and valuable Library as it did, but it would be much more valuable if its importance had been realised earlier. The opportunity of collecting old drawings and ornament and architecture was very quickly passing, and within a few years it would be almost impossible to go into the market and buy them. The Institute must not grudge the public those drawings that some of their kind friends took the trouble to collect and give to South Kensington. They were their drawings all the time, and the only thing that resulted from their being sent to South Kensington instead of to the Institute Library was that they had to share the use of them with other people.

Mr. Rudolf Dircks

said there was no reason to fear that the department of the Library with which the author had dealt would stand still, notwithstanding the energy of South Kensington, although he thought there was a fear that the collection would outgrow the present space. With regard to their collection of books, he ventured to say that the bibliophile who was also an architect would find very few shelves in the Library which did not contain something of interest and note. He could only hope that in the course of time some liberal benefactor might endow the Library with a sufficient sum to enable the Committee responsible for the book collection to deal more adequately with it.

Mr. W. H. Ward

said that Mr. Townsend had only touched upon the drawings in the Library, but there were a great many other treasures in the way of illustrated books, engravings, etc. The paper would have done great service if it gave those who were responsible for the finance of the Library some idea of its needs. The Institution of Civil Engineers spent something like 600*l.* per annum on books, nearly half of which went towards binding, and the Surveyors' Institution spent about 300*l.* The Institute spent the magnificent sum of 150*l.* a year, out of which about 40*l.* went for binding, and out of the remainder they had to purchase duplicate books for their loan library. If they could get 150*l.* allocated to spend on books for the reference library only it would be a great boon to the students and would add very much to the value of the collection.

Mr. Herbert Batsford

suggested that a more appropriate title for the paper would have been "Some Drawings in the Institute Library." Mr. Townsend dismissed the books with a few paragraphs, although he was sure it was not his intention to belittle the Library as a collection of books. He would like to see a paper by the librarian dealing with the splendid collection of books which the Institute possessed, which included the greatest folios that had ever been published on the subject of architecture.

The Chairman

said that on behalf of the Institute he wished to express his thanks to Mr. Spiers for his gift of drawings by the late Sir Henry Layard. With regard to the remarks of Mr. Ward, he could assure them that the Council of the Institute were fully alive to the importance of the Library, and they hoped shortly to be able to do more in that direction than they had done in the past. He had been greatly impressed by the marvellous beauty of the draughtsmanship shown in the drawings and the wonderful accuracy of the perspective, and if their students were to study those drawings they would see that some of the present-day draughtsmanship was not to be compared with that of the men of the former centuries.

Mr. Townsend

briefly replied, and acknowledged the help he had received from Mr. Dircks, the librarian, Mr. Keith, the assistant librarian, and Mr. Spiers. With regard to the drawings of Norfolk screens, probably the explanation of Mr. Strange possessing what he thought to be an absolutely unique set might be explained by the fact that the drawings in the Institute Library were manifestly tracings. Mr. Batsford had criticised him for belittling the books, but those who knew the Library as well as he (Mr. Townsend) did would know that to be far from his intention. The books in the Library were a huge subject, and he had preferred to take the lesser in his paper.

It was announced that the next meeting would be held on Monday, May 6, being the annual general meeting.

THE SOCIETY OF ARCHITECTS.

The sixth ordinary meeting of the Society of Architects for the Session 1911-12 was held at No. 28, Bedford-square, W.C., on April 11. Mr. Percy B. Tubbs, F.R.I.B.A., Vice-President, took the chair, in the unavoidable absence of the President.

The following candidates were elected as members:—Mr. F. A. Browne, Springfield, Chelmsford; Mr. T. Foley, Beverley, Yorks; and Mr. G. S. Valentin, London.

Mr. C. McArthur Butler, F.C.I.S., Secretary of the Society, then opened a discussion on "Some Principles of Professional Practice and a Code of Ethics."*

Mr. R. G. Lovell,

in moving a vote of thanks to the Secretary, congratulated him on the result of his efforts in calling attention to the matter before them. The idea of forming a Board of Professional Control was a very excellent one, provided an assurance was forthcoming that it could be got together promptly. If, with the object of gaining greater unity, they were to wait for the co-operation of all the allied societies, the Royal Institute, and the other institutions mentioned, he could easily foresee that the matter would drag on for as long as their previous negotiations with regard to Registration. The Society prided itself upon the fact that it was the forerunner of Registration, and he saw no reason why they should not adopt the same attitude with regard to the suggested code of ethics, and he thought the Council would be acting in the best interests of the profession by pushing the matter forward immediately.

Mr. A. O. Collard,

in seconding the vote of thanks, said he had listened with keen enjoyment to Mr. Butler's paper, and thought it would come as a surprise—possibly a painful surprise—to many architects that any such suggestion as a body to control professional practice and to institute a code of ethics was necessary or desirable. Many of them, he assumed, managed to get along in the profession without treading on other people's corns, and without committing any professional enormity, possibly for want of courage, but more likely by reason of a high moral rectitude. There were two broad divisions of misdemeanour—that against a brother professional, and even worse conduct against the public. Regarding the latter, there was the Common Law to deal with such matters, and he did not know whether Mr. Butler suggested that the Common Law should be set in action against offenders by the proposed Board or whether the latter was merely to control the action of members of the profession in connexion with their own brethren. He wondered whether the architectural profession was on all fours with those other great professions of law and medicine. He agreed that public attention was sometimes drawn to cases in which members of those professions were seriously dealt with, but he thought that in nearly every case it was for offences against the public, so that he did not know whether they could base their reason for wishing for such a controlling body, on the professions of law and medicine. Mention had been made of a schedule of the principles of practice and a code of ethics. Was it suggested that there should be two distinct schedules? Was not a schedule of the principles of practice the same thing as a code of ethics? He thought with Mr. Butler that it was a very doubtful advantage to have any fixed charge whatever, and that it would be better to leave it open so that a man could charge whatever he thought himself worth. There should be nothing to prevent a man charging 10 per cent. if he thought he could get it, as they were well aware that in certain special work a man might have trained himself thoroughly and the value of his work be worth two or three times as much as the ordinary scale gave him. It was rather severe on young architects to suggest that they must not compete with regard to fees or undercut to secure work. He knew that some of the public thought they had a perfect right to offer a young architect less than they would an older man, although he might be the more skilful designer, and he did not see how that could be met. It seemed a little hard that young architects should not be allowed to work at a lower figure, bearing in mind the fact that many of them were able to work at home, and so avoid the heavy charges which some of them had to bear before they made a penny. Some hard-and-fast line should be drawn to define what were and what were not honorary services. It had often happened that an architect gave his services gratuitously, but after his expenses had been paid there was really very little difference. A man should not be able to obtain work on apparently honorary terms, doing some other man out of the work, and yet reap some benefit from it. He noticed that expert services should command payment proportionate to the responsibility and difficulty involved, but who was to be the judge of that value and responsibility? Naturally, they themselves knew what it was worth, but was it suggested that architects should be the judges of their own value? That was the point upon which the Courts came into conflict with them, and was also the reason why the Courts sometimes ignored the Institute's scale of charges.

Mr. W. H. Seth Smith

said they had met to consider their moral obligation not only as individuals, but in their corporate capacity as a class of public servants; and this not merely from the point of view of expediency or custom, but as he understood the author of the paper to imply, from the loftier standpoint of character as formed on the universally acknowledged but little obeyed axiom of doing to other men as we would they should do to us. This principle might be interpreted thus:—We do not desire to benefit ourselves at the expense of the interests and rights of others, whether clients or builders, *e.g.*, we will not use our corporate powers (statutory or otherwise) to restrict the freedom of any man to employ any amateur instead of one of our profession if they prefer to do so. He did not know of any greater want in the architectural profession than a well-written manly book on this subject, approved by the Councils of the various societies, which could be put into the hands of every student as a text-book on this vital question. He claimed for the British professional unions (as distinguished from trade unions) that the vastly-improved public esteem and confidence or status they enjoyed is due to their having in the past laid down and pursued a policy based, broadly speaking, on the following lines:—

(1) They have endeavoured not to limit the freedom of individual members beyond the necessary protection of the equal rights of his fellow-members.

(2) They have never attempted to force employers to remunerate their services at a fixed or unreasonable rate. The cynic might reply that they have not been strong and united enough, but the fact that fair payment has been forthcoming in spite of this corporate disability is proof of their sweet reasonableness!

* See our issue for April 12, p. 421, for an abstract of the paper.

(3) No one was granted membership whose training and skill was below the standard the Society set up, and this educational policy was diligently organised and improved.

(4) A standard of moral etiquette was demanded. No commission was to be accepted from third parties. Members were expected never to depreciate the qualification of their colleagues or to tout for employment where others of their calling were retained, etc.

(5) No limitation of the numbers of members or of their hours or output of their work was ever attempted. It was realised that the man of exceptional talent and endurance was entitled to translate his superior powers into proportional wealth; or that the man with heavy domestic responsibility to burn the midnight oil.

(6) No inducement to join the Society was offered other than the advantage that knowledge gives and the fact that corporate action in resisting injustice was more powerful than individual effort.

(7) The question of remuneration was the last point dealt with, for the reason that to insure the confidence of employers, and the consequent increase and permanence of employment, freedom of contract was necessary, and the public must be convinced that it served their interests best to employ those who had strenuously fitted themselves to be experts, and whose claim to the profession was acknowledged by their own class—their rivals.

It was assumed, and he thought justly, that clients were willing to pay reasonable fees if the advantages were clearly commensurate. The policy was, in short:—

(*a*) To benefit the public by giving the very best of services.

(*b*) To benefit their members by fellowship and by due preparation for professional duty, and thus enable them to reap the confidence, work, and pay which invariably result from such policy.

(*c*) By organised resistance to frustrate attempts on the part of individuals, corporations, or of the Legislature to impose unfair or unjust conditions on their members. Should such moral or legal resistance be abortive, the obvious and final resort was the corporate withdrawal of service. This weapon the medical profession had been obliged for the first time (this winter) to threaten to use, and architects, though not so immediately affected by democratic employment and democratic legislation, have had to adopt in a more limited degree by their recent agreement not to enter competitions under conditions unfair to their members.

Mr. Butler's suggestion that the R.I.B.A. code, as presented in the *Kalendar*, was very meagre and insufficient, might, he thought, be admitted. Convinced and confirmed Registrationist as he was, he was not so sure that any Registration Act which they might, and he believed should, obtain before long, would enable them to make more public or to enforce such a code of morals as was suggested. The great value of statutory Registration would be, as Mr. McArthur Butler premises, the bringing of the at present detached architect under a commonly accepted code of architectural etiquette, but legislation directly or indirectly compelling any man to join a professional body would be a gross breach of the liberty of the subject, and should never be suggested in applying for a Registration Act. As Benjamin Kidd says, "Every party in the State, nobles, middle classes, and middlemen has endeavoured in its time to identify the State with its own interests. The quarrel of society with each of them in turn in the struggles of history has been that they have all endeavoured, when they held the State in their power, to exact from the community more than they were entitled to for services rendered in terms of social utility. To hold the community up for the most they can extract from it." Let them see to it that no picture of this class selfishness laid them open to future censure.

Mr. Arthur J. Martin

(President of the Institute of Sanitary Engineers) said he was sufficiently in touch with the architectural profession to be interested in the matter. He thought he could take it that the interests of their two professions were identical. His opinion was the somewhat unconventional one that they should not lay too much stress upon the interests of their respective professions. After all, they both existed for the service of the public, and a code of ethics could only be justified so far as it protected the interests of the public. The great question appeared to him to be that no person should be at liberty to represent himself as an architect or engineer without possessing the necessary qualifications for the title. Personally, he could not see any reason whatever why an incompetent man should be at liberty to practise in either of these professions any more than he was able to as a solicitor, medical man, or dentist. In their professions, just as much as those he had mentioned, the incompetent man was a danger to the life and health of a large number of people. It was not a matter for the professions to determine, but one which the general public had a right to demand. What that qualification should be was another matter, whether it should be limited to those who had undergone a recognised term of pupilage, or what not, the guiding principle should be, not that the principal work should be restricted to a limited number of hands, but that it should enforce that minimum of professional qualification which was absolutely necessary in the interests of the public.

Mr. A. S. E. Ackermann

said he thought more attention might have been drawn to the professions of law and medicine, from which they might learn a very great deal from their experience. Some years ago he had had occasion to make inquiries of the British Medical Association in regard to the question before them, and he was astonished to find how deeply they had gone into what was more or less an unwritten law. The vast amount of work done by the British Medical Association had nothing to do with Registration, but was purely and simply moral persuasion, and, although their membership was but two-thirds of the whole medical profession, yet they were in such a strong position that if two practitioners who were not members of the Association had a difference which in the ordinary course of events would lead to the Law Courts, they would involuntarily go to the Association for the settlement of their dispute. Solicitors were tied down to certain maximum charges, and their interests were otherwise properly looked after, but they were not bound to charge the maximum fees.

Mr. A. Alban H. Scott

said that most of the discussion had turned on the question of architects' fees, which he thought a great pity, because architects usually looked upon their fees as a secondary consideration, and did their work for the work's sake. With regard to the remarks which had been made as to the principle of payment by commission being an immoral arrangement, no doubt it was an unhappy one, but the young architect, he thought, fully realised that his career would be made not by his financial income or by piling up the cost of the work, but by getting economical buildings for his client and making, and afterwards maintaining, a proper reputation. In the course of their work architects had to deal with specialists and structural engineers, and there was an undoubted tendency at the present day for everyone to more or less specialise, which meant professional unions. The aim of the paper seemed to be exactly the same as that of the labour market, namely, to get national federation. The legal and medical professions had it to a certain extent, and there was no doubt that professional combination had resulted in nothing but good both to the public and to the respective professions. Similarly architects would benefit by a greater professional unity.

After some remarks by Mr. A. Lawrence Cox, F.S.I.,

The Chairman

summed up the discussion, and said he personally hoped that a code of ethics would be adopted, and that the Council of the Society would appoint a Committee to inquire into the matter. The discussion that evening would be of the greatest possible assistance to them. With regard to illicit commissions being no longer necessary owing to the recent Act of Parliament, he, the speaker, thought it had made matters worse if anything, for as matters were originally only one man was considered to be in the wrong, and he was the receiver of the commission, but under the Act both giver and receiver were condemned, and so, as the lips of both were hermetically sealed, there was less likelihood than ever of such things becoming known.

A vote of thanks to Mr. Butler was then put to the meeting and carried with acclamation.

Mr. C. McArthur Butler said he would reserve his reply for the *Proceedings*.

RECENT WORKMEN'S COMPENSATION CASES.—II.

In continuation of our recent review of decisions under the Workmen's Compensation Act we have now to refer to a few cases which relate mainly to practice.

Termination of Incapacity.

In the case of Hargreave *v.* Haughhead Coal Company, Ltd., the House of Lords had to consider the case of a miner who, on February 18, 1910, met with an accident to his right eye which necessitated its removal. Compensation was paid to September 15, when the employers applied for a review. At the hearing, on November 12, it was proved that the man's incapacity had ceased and he was fit to resume his occupation as a miner, but that he had incipient cataract in the left eye which would subsequently incapacitate him from work; this cataract, however, was in no way due to the accident. It was also proved that his condition on September 15, when the payments were stopped, was the same as at the date of hearing. It was a Scotch case, and on these facts the Sheriff Substitute terminated the compensation as from September 15. The House of Lords held that the mere fact that the workman had lost one eye, increasing the risk of blindness, did not entitle the man to have the award kept open, and that the order had been rightly made. This case illustrates the inequalities of the Act, as it shows that, as applied, the test of capacity is hardly satisfactory. This becomes apparent if the above decision be compared with that of the Court of Appeal in Cory Brothers, Ltd. *v.* Hughes, noted the *Builder*, September 15 last. A man had sustained an injury to his left hand, which however did not eventually prevent him from using it in certain forms of light work. He was given light work, but some time afterwards was prevented from continuing it by reason of heart disease wholly unconnected with the accident, yet he was awarded compensation. The Master of the Rolls said: "I cannot bring myself to doubt that the man is disabled in the labour market by reason of the accident from earning wages which even with his bad heart he might otherwise have been earning at the present moment." The distinction between the two cases is that in the latter case the man had never recovered his earning powers, whereas in the former case the man was held to have done so; but having regard to the position of a one-eyed man in the labour market since the passing of this Act, when all employers are afraid to engage him because if an accident happens to his remaining eye he will be entitled to compensation as incapacitated for life, the case is a hard one, besides being somewhat illogical, for if an accident occurs to the man's remaining eye his total incapacity will not be due to that accident, but to that accident plus the former accident, yet in such an event the original accident would not be regarded (see Noden *v.* Galloways, Ltd., the *Builder*, November 24, 1911). In such cases to a layman it would appear that a nominal award of 1d. to keep the claim alive would be the proper order, but, as the law stands, in certain circumstances it favours one-armed men more than one-eyed men. On this subject the case of Ball *v.* William Hunt & Sons, Ltd. (the *Builder*, April 7, 1911), may also be consulted. In that case a second accident rendered obvious a loss of sight which had occurred from a previous accident. The man's earning capacity remained the same, and the majority of the Court of Appeal held appearance in his class of employment, an edge tool moulder, not to be essential to employment. From the cases, however, it is quite clear that if the loss of an eye can be shown to affect earning capacity then the compensation should not be terminated.

Form of Award.

In Higgins *v.* Poulson a man was suffering total incapacity from an accident. His employers were willing to pay full compensation during total incapacity, and the County Court judge made an order for the weekly payments "to continue during total or partial incapacity, or until the same shall be diminished, increased, or redeemed in accordance with the provisions of the Act." This is the form of award provided by the Workmen's Compensation Rules, Appendix I., Form 24; but the employers objected to it on the ground that they were only willing to pay full compensation during total incapacity. The Court of Appeal held the award to be correctly drawn up, as this form

enabled it to be enforced as a County Court judgment. Should any change in the circumstances take place the course for employers to adopt is to apply for a review under Schedule I., par. 16.

Registering Memorandum of Agreement.

In Popple *v.* Frodingham Iron and Steel Company a man, on August 16, 1911, met with an accident, and on August 30 his employers agreed to pay him 16s. 9d. as compensation from the date of the accident, and to continue during total incapacity. On December 9, 1911, the workman applied to have a memorandum of this agreement recorded, but the County Court judge found that at that date the man was not totally incapacited, and he refused to record the memorandum. The Court of Appeal held that the agreement ceased to be operative when total incapacity ceased, just as much as if it had been an agreement to pay to a definite date, and the memorandum ought not to be recorded. The law under the Act of 1897 was different, and this case denotes the alteration made by the Act of 1906.

Varying Apportionments.

The Act of 1906 introduced an important reform in respect of awards made to dependents. Formerly these could not be varied, and often the money in consequence was not expended to the best advantage; but now by Schedule I., par. 9, where children are neglected or circumstances have altered, power is conferred upon the Court to vary the apportionment. This power has been exercised in Ivey *v.* Ivey, in which case the Court of Appeal held that where a widow died leaving an unexpended portion of compensation which was claimed by her next-of-kin, the Court had power to reapportion the sum amongst her children dependents of the deceased.

Correction of Award.

As regards slips or mistakes made in an award, in John Mowlem & Co. *v.* Dunne the Court of Appeal held that the judge has power to alter the award until it is signed and sealed under Rule 28.

Evidence.

In a claim by dependents of a deceased blacksmith who had died from sceptic poisoning, caused, as it was alleged, by an accident, statements made by the deceased to the employer's manager to the effect that he had a whitlow on his thumb were held by the Court of Appeal, in Tucker *v.* Oldbury Urban District Council, to have been rightly excluded, because dependents have a statutory right to compensation and do not derive their rights through the deceased; the deceased was no party to the action, and it was not shown that the statements were to the knowledge of the deceased, or, in fact, contrary to his interest.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association.

At a meeting of the Birmingham Architectural Association on the 12th inst. the Vice-President (Mr. G. Salway Nicol) read a paper on the Association's visit to Holland. The great charm of Dutch buildings, he said, is due to the fact that they are such a complete expression of the character and ideals of the people. Their domestic work particularly has much to teach us in the simple and direct way they obtain their effects. For their more important buildings, such as the "Studhuis" at Middelburg, they generally employed a phase of the Gothic style directly inspired by similar buildings in Belgium, but at the same time the detail is full of native feeling. The Abbey buildings at Middelburg and the Town Hall and Church at Veere were shown by many sketches made by the members, and the great influence of Dutch work in England in the XVIIth century pointed out. The great attraction which Holland has for architects at the present time is largely due to its beautiful architecture.

Leeds and Yorkshire Architectural Society.

A general business meeting of this Society was held on Thursday, April 18, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., in the chair. The Hon. Secretary, Mr. Wm. Whitehead, A.R.I.B.A., read the Report of the Council for the past year. The total membership of the Society on March 31, was 182, comprised of thirty-two hon. members, seventy-four members, and seventy-six Associate members.

The Hon. Treasurer, Mr. R. Fielding Farrar, presented a financial statement for the year, showing a balance of 57*l.* 19s. 1d. The report and balance-sheet were adopted on the motion of Mr. J. E. Braithwaite, A.R.I.B.A., seconded by Mr. Moreton.

The following officers were elected to serve on the Council for next session:—

President—Mr. A. E. Kirk, A.R.I.B.A.; Vice-Presidents—Mr. G. F. Bowman and Mr. J. F. Walsh; Hon. Treasurer—Mr. R. Fielding Farrar, A.R.I.B.A.; Hon. Librarian—Mr. W. Peel Schofield, A.R.I.B.A.; Hon. Secretary—Mr. Wm. Whitehead, A.R.I.B.A.; Members of Council—Messrs. W. J. Morley, F.R.I.B.A., C. B. Howdill, A.R.I.B.A., G. W. Smithson, A.R.I.B.A., J. C. Procter, A.R.I.B.A., G. J. Combs, A.R.C.A., Douglas Bowman (Associate member).

A vote of thanks was accorded Mr. Sydney D. Kitson on his retirement from the President's chair. It was remarked that he had worked hard during his term of office, and with a spirit of comradeship that had been pleasant for everybody.

GENERAL NEWS.

Royal Institute of British Architects.

An exhibition of original drawings in the possession of the Institute is being held in the Institute Galleries during the present week from 10 a.m. till 8 p.m. (Saturday 10 a.m. till 6 p.m.). The exhibition will close on Saturday, the 27th inst.

Knebworth Garden Village.

The first sod of the Knebworth Garden Village on the estate of Lord Lytton was cut on Saturday last. About 1,000 acres at Knebworth have been set aside and a comprehensive scheme of development has been prepared by Mr. Edwin L. Lutyens, acting in conjunction with Mr. Thomas Adams, now Town Planning Adviser to the Local Government Board. The working out of the plan and the detailed plotting is being carried out by Messrs. Pepler & Allen. The development of the garden village is being undertaken by Garden Villages, Ltd., of which Lord Lytton is President. A feature of the scheme is the formation of a Co-partnership Tenants' Society, named Knebworth Tenants, Ltd., which is arranging to build cottages with good gardens round the village green. These cottages are to be let at 5s. 6d. and 6s. 6d. a week, and each has three bedrooms and a bathroom.—The ceremony was performed by Mrs. Cecil Harmsworth, Sir T. Sydney Lea, Bt., Chairman of Garden Villages, Ltd., presiding. He said that what was necessary in such schemes was the co-operation of the landlord and his tenants. A notable feature of the scheme was the co-partnership tenants system, under which the profits went to the reduction of rent.—Mr. Cecil Harmsworth, M.P., said that the garden city movement was one of the romances of the time.—Lord Robert Cecil said that at Letchworth they had what was so far the only complete example of a garden city, and they hoped to see something of the same kind established at Knebworth. It was on those lines that they were destined to find—he would not say the whole solution—but some part of the solution of the greatest social problem of modern times—the housing problem. The great difficulty was to provide good houses at a price which those who lived in them could afford to pay. The problem was quite as urgent in rural districts as in urban. It was on the lines of co-partnership that we had the best chance of looking for the solution of most of the great social problems. He had the greatest reverence for the old economists with their suggestion of the division of labour. Division of labour was, no doubt, an economic principle of great importance. But, carried to the extent to which it had been carried in this country, it had destroyed all human interest in the methods of labour. Unless we could find some means of reuniting humanity with labour the outlook in this country was very black. The principle of co-partnership was the most hopeful means of dealing with the problem.

Cambridge University: New Buildings.

The Lords of the Treasury have provided for the formal transference, in April of next year, of the Solar Physics Observatory to Cambridge University, and have allocated sums of money for the purchase of additional land, the cost of new buildings and equipment, and the provision of instruments and apparatus. The Development Commissioners have established a Research Institute for the Cambridge Board of Agriculture, and propose to make a grant of 18,000*l.* on behalf of an extensive addition to the School of Agriculture buildings. Other schemes in progress comprise a new Forestry Laboratory, to be erected on the Downing College land, concurrently with a new code of regulations affecting the probationers, and their courses of study, of the Indian Forestry Department, which will now be brought into closer relation with timber merchants, builders, and others, and so establish more active co-operation between contractors and merchants, and the work of that department.

St. Olave's Church, Mile End New Town.

The vestry of St. Olave's, Hart-street, E.C., are about to close the Church of St. Olave in Hanbury-street, E., in view of the fact that the population having become mostly Jewish the services are very sparsely attended, and it is proposed to transfer to other needy parishes the annual subsidy of 600*l.* derived from the income of St. Olave's, Hart-street. St. Olave's, Mile End New Town, was built by the rector of the City parish, for 500 sittings, after the designs of Sir A. W. Blomfield, and consecrated in 1875, the endowment being provided out of the funds of the parish of St. Olave, Hart-street.

The National Nautical School, Somersetshire.

The King has expressed his regret that he cannot visit Portishead next month when the Chapel of the National Nautical School is to be dedicated by the Bishop of Bath and Wells. He will be represented by H.S.H. Prince Louis of Battenberg, who will inspect the school and give away the prizes to the boys. The school was built from the designs of Mr. Edward Gabriel (Messrs. Edmeston & Gabriel), who also designed the chapel, which is now nearing completion. Messrs. Cowlin & Sons, of Bristol, were the contractors for the school buildings, and Messrs. Saml. Martin & Sons for the chapel. H.S.H. Prince Louis of Battenberg has fixed the date for his visit on May 14.

Royal Scottish Museum, Edinburgh.

Steps are being taken to make extensive enlargements and improvements of the Museum. It is intended to expend 6,000*l.* upon a new administrative block, and about 48,000*l.* upon an enlargement, to double the capacity of the Natural History galleries by the erection of three upper floors. Other galleries are also to be enlarged, embracing the Machinery Hall. A south-eastern lecture hall is to be erected, and the principal hall will also be extended.

Crystal Palace Engineering School.

The "Wilson Premium" for the best paper read before the Crystal Palace Engineering Society (affiliated to the Society of Engineers, Incorporated) during the present session has been awarded by the Council to Mr. E. C. Coke, for his paper on "The Electrification of the L.B. and S.C. Railway." Other papers read during the session were "Railway Signalling," by Mr. S. A. Hall; "Macadam and other Roads," by Mr. J. D. Deane; "Town Water Supply," by Mr. A. H. Talbook; and "Internal Combustion Engines," by Mr. E. C. Whelon. The premium was presented to Mr. Coke by Rear-Admiral Gordon Wilson Moore, C.V.O., Director of Naval Ordnance, on the occasion of the 118th distribution of certificates to the above School on Wednesday, April 17, at which he presided.

COMPETITION NEWS.

Designs for Monument, Canada.

H.M. Trade Commissioner reports that the Public Works Department invite designs for a monument to be erected at Ottawa to his late Majesty King Edward VII. The monument, including pedestal, is to cost about 35,000 dollars (about 7,200*l.*). Designs must be in the form of sketch models in plaster, made at a uniform scale of 1½ in. to the foot; they should be sent to Mr. Eric Brown, Director of the National Art Gallery, Ottawa.

Canada, and must be delivered by October 1. Communications regarding the competition should be addressed to the Secretary, Public Works Department, Ottawa, Canada.

Regent's Quadrant.

In connexion with the competition instituted by the proprietors of the *Builder* for a new façade to the Regent's Quadrant, we would remind competitors that any inquiries should reach the Editor by the 29th inst. Replies will be published in our next issue.

Sunk Arena and Bandstand, Hastings.

With reference to the "Note" on this competition in our last issue (p. 445), we are informed officially that the Hastings Corporation have withdrawn the offending stipulation, and will return deposited cheques on receipt of competitive drawings. The date for sending in designs has been extended to May 18.

Middlesex Hospital, Berners-street.

Mr. Edmund Davis, a Governor of the Middlesex Hospital, has generously arranged for the rebuilding of the entrance with a view to mural decoration. The plans, by Mr. Keith D. Young, F.R.I.B.A., provide for four wall-spaces, lit from the roof, each measuring 5 ft. 8 in. high by 10 ft. 11 in. broad. The architect proposes a dark wooden dado, preferably of teak, and a moulding for the paintings either of the same material or of some other, at the discretion of the painters, and that outside the moulding should be a plain surface of white or light-coloured plaster. Plans are on view at Crosby Hall, Chelsea, showing the arrangement and lighting.

The subjects, it is suggested, should be symbolical, such as "The Good Samaritan," or might be cheerful scenes of convalescence, in the country or by the sea, or scenes of ordinary life at different times of the year.

Each competitor is limited to one design, which must be sent to Crosby Hall by May 21. Co-operation between several designers is permitted.

Mr. Davis, who is a well-known connoisseur, offers 100*l.* for the execution of each painting from a design approved by him. In the event of a design being accepted and not approved of by the Middlesex Hospital, the sum of 50*l.* will be given in lieu of the execution of the work.

Public Elementary School, York.

The first premiated design for the Knavesmire Council School is by Mr. John T. Proffitt, M.Inst.C.E., Central-buildings, Memorial-road, Walkden, near Manchester. The second design is by Mr. E. R. Barrow, F.R.I.B.A., Lennox House, Norfolk-street, Strand. The third design is by Mr. J. A. O. Allan, 25, Union-terrace, Aberdeen. The assessors were Messrs. T. Mellard Reade & Son, of Liverpool.

Cardiff Football Stands.

The result of the open competition for new grand stand, etc., for the Cardiff Rugby Football Club is as follows:—First premium (30*l.*) to Mr. Leitch, of Liverpool. Second premium (20*l.*) to Messrs. R. & S. Williams, of Cardiff. Third premium (10*l.*) to Messrs. Ivor Jones & Percy Thomas, of Cardiff.

BOOKS.

Architecture: An Introduction to the History and Theory of the Art of Building. By W. R. Lethaby. (Home University Library.)

When it was announced that the promoters of the Home University Series had confided the subject "Architecture" to an author, and assigned him the space comprised within the green covers of one of their handy little pocket volumes in which to develop the theme, imagination boggled at the pictures called up, of Fergusson brought up to date, carefully desiccated, pounded, pressed, and seasoned to taste —the whole history of the Mistress Art from the cave-dwellers' lair to the sky scraper—neatly packed into 250 duodecimo pages! One knew not whom the more to commiserate, the author doomed to carry out the process or the reader who should attempt to get his teeth into the indigestible viand. Happily neither are in need of our pity, and both rather claim our congratulations. The works issued in this admirable series have nothing in common with the cram-book. The plan is that each volume shall be a "new work inspired by knowledge of the latest research and critical thought" and one in which "the best voices of contemporary scholarship" shall be heard. "Each . . . [is] to constitute a vivid introduction to its subject, throwing into relief its fundamental principles and ideas, to be an incentive to further study rather than a dry text-book." With this last end in view a compact bibliography is appended to each volume.

In the selection of Professor Lethaby the editors have been peculiarly happy, for he is incapable of producing pemmican, and no architectural writer more fully merits the adjective "vivid." While none knows better than he how to pass in review a vast range of topics, he never allows the trees to conceal the wood, and while eliminating the unessential and marshalling the serried ranks of the selected facts he ever avoids the least danger of aridity by providing green oases of enthusiastic description—delightful because delighted—or interspersing humorous and penetrating *obiter dicta*. Here is an example:—"A self-conscious appeal is likely to become a disease of art, the true appeal is a fact. Barns, waggons, and lighthouses do not appeal, they *are*, or I should say *were*, for I saw a lighthouse some months since on which no expense had been spared to make it æsthetic, and it illuminated the whole problem."

There was a time when, as it is rumoured, the burden of Professor Lethaby's teaching to architectural students was "Burn your books." He has slightly altered his position nowadays, and we are allowed to read our books, provided that we do not attempt to do again anything we see in them. Archæology indeed looms large in these pages, and no more competent guide than our author could be found to conduct us rapidly, while missing nothing that we should see, through the history of ancient and mediæval architecture. The chapters are unequal in length and diverse both in scope and method of treatment, but all have valuable lessons or at least provide food for thought. Professor Lethaby is perhaps at his happiest when he explores the dawn of history in the Eastern Mediterranean or traces the achievements of Greece and of the Early Christian and Byzantine Schools, or when he points out the debt owed by European architecture to those varied and fascinating phenomena of Oriental Art which he groups together under the apt title of "The Eastern Cycle." The relatively ample space which he has assigned to Egyptian "Monuments, Methods, and Ideas" may appear, as he himself admits, excessive, while, on the other hand, his dismissal of all Gothic architecture in two short chapters occupying between them less than thirty pages is a little tantalising. In so brief a work the less vital branches of this as of other subjects are necessarily rejected, and we are restricted to France and England, but how differently we fare in the two countries! The English chapter is not only fuller, as indeed is right in a work intended for English readers, but also more systematic and more closely packed with well-digested information, resolving itself to a large extent into a valuable essay at a more reasoned system of chronological classification. In the preceding chapter on France, on the other hand, it would be hard to find a concrete statement of facts, a date, or even a name. It is a dithyramb on the "Art of energy," a lyrical outburst glowing with the glory and the triumph of that wondrous Middle Age and its craftfulness. If it does not inform greatly, it cannot fail to inspire.

As might be expected, the Renaissance comes off but ill at our author's hands, and, on the whole, we are glad he restricted himself to seven pages! It is "a style of boredom . . . it tends to be blind, puffy, and big wiggy." "As a whole it seems to be the art of an age of indigestion." But Professor Lethaby is always entertaining, and we readily forgive him these quips in view of the charming way he has of making them. Nor must we overlook the essential fairness which enables him to allow some merits even to the "pestilent art." "The first enthusiasm of the Renaissance must have been a wonderful experience when men like Donatello ["Donatello" observe, not "Brunelleschi"!] awakening to the idea 'We are Romans,' explored the Forum and broke into the Great Baths." "The great gift of the Renaissance would seem to be the scientific spirit, and we probably owe to it larger ideas of civic order and hygiene." "Its arts to some degree reconsidered first principles." Certain individual works of the Renaissance are even "beautiful" in his eyes.

In the last chapter, on "The Modern Position," we have him at his most characteristic. It must be read to be appreciated, and, whatever we may think of the views set forth, it will prove as delightful and stimulating reading as any other part of a book which is alive from title to *Finis*, and suggest two thoughts for each one it expresses. It is an astonishingly able performance, showing a rare combination of encyclopædic knowledge and critical insight with the difficult arts of selection and of expressing results in limpid and flexible English. None surely can read this delightful essay—and none should omit doing so—without a feeling of personal indebtedness to the author.

In regard to the series as a whole, we venture the hope that it may be possible to supplement this necessarily rapid survey by the issue of volumes dealing more fully with each of the main great periods. There is surely a demand among the wide public to which this series is addressed for volumes on the Byzantine, the Gothic, and the Renaissance Schools, to say nothing of more ancient history.

Pompeian Decorations. By R. A. Briggs, F.R.I.B.A. (London: Batsford. 1912. 25s. net.)

The very first sentence of the Preface of this book contains a statement which anyone acquainted with some of the more monumental works on Pompeii must examine with critical hostility:—"Owing to the absence of any process that could faithfully reproduce the drawings, no book has hitherto been published which shows with fidelity the beautiful and gorgeous colouring of the mural decorations of Pompeii." He goes on:—"Two works on the subject were produced by lithography some years ago at a high price, and before the three-colour process was invented or brought to its present state of perfection; but they show very inadequately the beauty of the decorations and the delicacy of their form and colouring." Well, these remarks with their implications are substantially untrue. To those who know and marvel at the wonderful publications of Signor Niccolini and Herr Zahn, but especially that of the first named, the inevitable reflection, on turning over the leaves of Mr. Briggs's book, will be: "If the former men and methods were inadequate, how much more so this later one! Where is the advantage of a perfect three-colour process if it be used but to put more faithfully before us the pink prettiness we have here; what the compensation for the velvet depth and atmosphere of a view done under the direction of Niccolini, or the verisimilitude with subtle opalescence and effects of light of one of his plates of details, in these most young-ladylike sketches by Mr. Briggs?" And, turning to reproductions of some of the "principal decorations, which *in many cases* are drawn to scale" (!), of what avail these scraps and patches? On Plate I. six shreds of mosaic, being part of the decorations of a column, feebly indicated at the side; on another (at random) part of a ceiling, pretty enough as far as it goes, but what of the whole? And so on, interspersed with meagre details poorly drawn in pencil—details which have been ever so much better done fairly recently by Mr. S. C. Watt. But supposing the colours are accurate reproductions (they look faded)? We will go so far as to say that they are probably accurate enough as far as Mr. Briggs's drawings are concerned, since we have some confidence in Mr. Batsford and those who work for him. But are Mr. Briggs's colours more reliable than his drawing, which is always feeble and in some cases definitely wrong? No. Let those who tackle big subjects do so seriously and thoroughly, or leave them alone. And let those who can do neither refrain from introducing their casual labours with slighting references to the directors of works which put their own to shame.

CORRESPONDENCE.

The R.I.B.A. and Registration.

SIR,—In reference to the letter from the Institute Members' Club, which appeared in the *Journal* of the R.I.B.A. of the 15th inst., we should like to point out that the question of Registration with which it deals is one so profoundly affecting the welfare of the profession that it should not be allowed to die through the apathy or indifference of the responsible guardians of the trust and obligations imposed upon them by the general body of the Institute. Nobody regrets more than ourselves the futile efforts made by the R.I.B.A. to deal successfully with a great problem which is of vital interest to every practising architect. These futile efforts were the result of an adoption of a foolish compromise which satisfied neither side, and subsequent events have shown that the compact made five years ago was an unworkable one. In these circumstances we now feel free to take an independent course and to definitely and finally throw over our allegiance to the policy of compromise then forced upon us, with which we have never pretended to be really in sympathy.

We consider that the R.I.B.A. scheme, even with any considerable modification of its details, could never become law, for it is ludicrous to suppose that any Government would permit the Institute to become the sole examining body for granting diplomas, or allow it to have sole jurisdiction over the profession of which it forms so small a part. For instance, the University of Cambridge has inaugurated a School of Architecture and instituted examinations on a higher and more comprehensive scale than those of the Institute. Is it likely that this ancient seat of learning, one of the two oldest educational centres in the kingdom, with its two Parliamentary representatives, would submit for one moment to the proposed dictatorship of the Institute?

Again, is it reasonable to assume that the University of Oxford, which will probably follow the sister University in founding a course of study in architecture, with its prestige, power, and influence behind it, will stultify a more than probable future educational extension by passively submitting to the philandering scheme of the Institute?

Surely, having regard to the fact that the policy of the R.I.B.A. is bound to bring about the active opposition of the distinguished Parliamentary representatives of these Universities, whose views on educational questions would be likely to be accepted by Parliament almost without question, there would be no chance of the Institute's Bill becoming law unless the equitable recognition of these and other educational bodies were freely accorded.

As a melancholy example of the short-sighted policy of the Board of Architectural Education, whose action was subsequently confirmed by the Council, we may quote the case of Cambridge University :—

Certain Universities of recent formation and without Parliamentary representatives which have adopted the R.I.B.A. regulations in regard to architectural study were regarded as "recognised schools," and, as such, obtained certain privileges—*i.e.*, exemption from the Intermediate Examination, etc. —whereas Cambridge, with a higher standard of education and powerful influence in both Houses, was not accorded a similar exemption. The absurdity of this exclusion is more apparent when certain other facts are taken into consideration, such as the privileges accorded to Liverpool and Manchester, which were granted because these Universities taught "Design," whereas Cambridge does not pretend to do so.

The reason for excluding Cambridge is not quite clear, inasmuch as "Design" is only an optional subject in the Intermediate Examination, and the confusion of ideas becomes absolutely chaotic when it is remembered that the leading opponents to Registration have declared over and over again that "Design" cannot be taught, and therefore, we should have thought, could not become a subject for examination.

However, the question of education is one of far too serious a nature to be allowed to be treated thus lightly and illogically, consequently, as a preliminary proceeding, we think the Institute would be well advised to approach the older Universities on the subject of architectural education in a far more friendly and conciliatory spirit than it has yet shown, with a view to enlisting their guidance and support. Further, it is folly for the Institute to imagine that it has the remotest chance of securing Parliamentary recognition for its members without due assurance that its proposals will not encounter active opposition of the Surveyors' and Engineers' Institutions, to say nothing of the many Borough and County Councils, all of which bodies will assuredly have to be placated.

In short, the Institute must remember that it is acting for the welfare of a large profession, of which it forms only a part, and not for the individual glorification of its members.

There is much spade work to be done by the Institute before any Bill can be drafted, and if the R.I.B.A. would condescend to set about this preliminary work instead of forming itself into committees to draft Bills which have no earthly chance of ever becoming the law of the land, the Council would be embarking on a course of profitable work. The continuance of its policy of spending its time and irritating its more serious members in futile efforts to obtain Parliamentary recognition without first preparing the ground seems to us to be nothing more or less than trifling with a stupendous problem which has yet to be solved.

A. W. S. CROSS.
GEORGE HUBBARD.

How Many Houses to the Acre?

SIR,—Referring to the "Note" upon my letter to the *Times* in your issue of April 19, it seems to me that the contributor of your "Note" is mistaken in assuming that the limitation of the number of houses to the acre is merely a question of maintaining a certain fixed relation between the cubic contents of building and the area of ground around that building. This, indeed, is one of the elements, but only one. The other, and perhaps on the whole more important matter, is to limit the number of families living upon the acre in order to secure to each family sufficient ground to give opportunities for the cultivation of a garden and for suitable recreation for the children of the family. From this point of view the size of the dwelling in which each family lives is, comparatively speaking, unimportant in determining the area of ground desirable for the family. In practice, therefore, I think that a simple limitation of the number of cubic feet of building to be erected on each acre would be found to be almost as crude in relation to some aspects of the problem as the simple limitation by means of a flat rate of the number of houses, irrespective of their size, is undoubtedly crude in relation to other aspects of the problem.

On the whole, therefore, I think it will be found that the system, which is now fairly generally being adopted by enlightened owners of land when trying to fix suitable limits, to put in the lease of such land to a society wishing to develop it upon right lines, is much the simplest and most satisfactory, and that is by means of a scale fixing a maximum number for houses of different sizes.

Moreover, it has this advantage, that it complies with the form of the present Housing and Town Planning Act, which gives power to limit the number and character, but does not give power irrespective of the number and character to fix the maximum number of cubic feet of building which may be erected.

RAYMOND UNWIN.

The Newer Responsibilities of Architects.

SIR,—In your report in the issue of April 19 upon the proceedings at the Royal Institute of British Architects on the 15th inst. it might be assumed, from the omission of any report of my reply at the conclusion of the discussion, that I accepted the numerous criticisms, both legal and lay, which were passed upon my paper. Will you, therefore, allow me space to repeat what I stated at the meeting, namely, that I found myself very considerably at variance with those critics, and much regretted that time did not permit of my replying properly to them?

I do not propose to encroach on your space by any attempt to repair the omission here, but may perhaps mention that anyone sufficiently interested may find a report of my observations in the next number of the R.I.B.A. *Journal*.

EDWARD GREENOP.

Hastings Bandstand Competition.

SIR,—Your readers have occasion to thank you for your frank remarks upon this competition in your issue of the 19th inst.

I am satisfied that the general public will not view with approval the attitude of the promoters, who not only adopt a most wasteful system of competition, but seek to make an actual profit from the overburdened professional by charging each of those competing an entrance fee of a guinea, which is not to be returned.*

Anything more unworthy on the part of a public body I can scarcely conceive, and one wishes they could more intimately know the circumstances of those who will compete.

The Corporation invite numbers of struggling men at a cost to each of them in money and labour of from 20*l.* to 40*l.* to compete for two prizes of the value of 15*l.* and 10*l.*; no promise is made that the work shall be given to the man whose design is accepted, nor any pledge that it shall not be handed over to be carried out by a Corporation official without any skill or knowledge of architecture whatever.

Experience teaches us that these invitations tempt from fifty to a hundred men to embark upon a lottery where the money and labour expended by them cannot be estimated at less than a thousand pounds, which for the most part must be thrown away.

Is it possible that the inhabitants of this beautiful town will permit such things to be done in their name? The terms practically exclude any architect of means or repute from offering his services to add to the beauty of the place.

There is another aspect of the matter, and that is that Hastings has already lost too many of its attractions through ill-advised action in matters of this sort.

The East-hill—the hill that has been painted by so many great painters, some of whom lived beneath its shadow—has been entirely destroyed as a picture by a lift running up its front; a lift surrounded by a sham Gothic castle, and the skyline of the hill is broken by the brick shaft of the sewer outfall works. The hand of the Road Surveyor and Engineer has had too free a play. The magnificent sea-front is disfigured by some of the most gigantic advertisement displays to be seen in the country. Truly the beauty of the place can only be preserved "at the price of eternal vigilance."

It is scarcely possible to believe that this can have occurred in a Borough where a few years ago the fine public spirit of the place sent abroad a student from the Paris School of Fine Art to study and design for them one of the best Town Halls of the time.

I trust, Sir, that before it is too late the Corporation will see that they have everything to gain by entrusting their work to the man whose design is accepted, and in dealing even in a generous manner with a profession whose members cannot be charged as a rule with being wealthy.

CHRISTOPHER M. SHINER.

INTERCOMMUNICATION COLUMN.

Treatment of Brickwork.

SIR,—Can you give us any information about the best treatment of brickwork from which salt is drying out? The brickwork has been done very carefully with cement. The bricks are pressed facings, and in this dry weather what should show as dark red bricks is almost as though it had been whitewashed. We fear if this salt which has dried out is allowed to sink in again there will be a repetition of the disfigurement in succeeding years. What do you suggest as the best treatment? Washing is not entirely effective with plain water, though we are trying this. Can you suggest a treatment that would be effective in one operation without injuring the work in any way?

B. P.

Insect Nuisances.

SIR,—In a new house many small insects, of the kind sometimes found in old books, have made their appearance. Can you give me the cause and any cure for this? There is a considerable amount of wood panelling in the house; could they have come in this?

O. P. M.

* See p. 483.

EDITORIAL SUMMARY.

"The British School at Rome" is the title of our leading article, which deals with the Royal Charter which it is proposed to grant to the School.

A second article appears on p. 476, entitled "Hospital Criticism."

In "Notes" columns (p. 476) will be found observations on: "The London Society"; "The Cockburn Society"; "The Aftermath of the Strike"; "The Institute Drawings"; "Indian Native Craftsmen"; "The York House Water Gate."

An article on "The Exhibition of the International Society" appears on p. 477.

A meeting of the R.I.B.A. was held on Monday, when a paper was read by Mr. C. Harrison Townsend on "The R.I.B.A. Library and some of Its Contents." An abstract appears p. 478.

A report of a recent meeting of the Society of Architects, when a discussion on "Principles of Professional Practice and a Code of Ethics" took place, is given on p. 480.

An article on "Recent Workmen's Compensation Cases" will be found on p. 481.

In "Architectural Societies" (p. 482) will be found short reports of: "Leeds and Yorkshire Architectural Society"; "Birmingham Architectural Association."

Book notices (p. 483) include: "Architecture: An Introduction to the History and Theory of the Art of Building"; "Pompeian Decoration."

In Correspondence Column (p. 484) will be found letters on: "The Newer Responsibilities of Architects"; "How Many Houses to the Acre?"; "The R.I.B.A. and Registration"; "Hastings Bandstand Competition."

Notes on some Magazines of the Month appear on p. 4 6.

The Monthly Illustrated Engineering Review (p. 487) contains: "Lighting by Air-Gas"; "Pure Cement Concrete as a Lining for Kilns"; "Colloidal Nature of Cement"; "Foundation Beads"; and Notes.

The Building Trade Section (p. 491) contains: "The Modern Bricklayer and His Work"; "The Mediæval Carpenter"; "Government Contracts"; "Projected New Buildings in the Provinces," etc.

Some notes on the Ideal Home Exhibition at Olympia are given on p. 494.

"The Sculptor's Assistance to Architecture" is the title of a paper read before the Leicester and Leicestershire Society of Architects, an abstract of which appears on p. 496.

Legal Column (p. 498) includes notes on: "The Finance Act: Site Values"; "Trade Union Law."

MEETINGS.

FRIDAY, APRIL 26.

The Society of Architects.—Twenty-eighth annual dinner, Holborn Restaurant. 6.30 p.m.

The Institution of Civil Engineers.—Lecture on "The Principles and Practice of Accountancy in relation to Engineering Design and Work," by T. Frame Thomson, Assoc.Inst.C.E. 8 p.m.

Royal Society of British Artists (Suffolk-street, Pall Mall, S.W.).—Mr. A. Wallace Rimington, R.B.A., R.E., on "Some Little-Known Sketching Grounds." The chair will be taken at half-past eight o'clock by Mr. Alfred East, P.R.B.A. The lecture will be illustrated by lantern slides.

SATURDAY, APRIL 27.

The Royal Institution.—Lectures on "The Architecture of the Renaissance in France, 1494-1661," by Professor Reginald Blomfield, A.R.A., M.A., F.S.A.: I.—"1547-1574: Architecture and the Court." 3 p.m.

Junior Institution of Engineers.—Visit to the Engineering Workshops and Laboratory and Electrical Laboratory of "The Polytechnic," 307-311, Regent-street, London. 3 p.m.

MONDAY, APRIL 29.

Royal Society of Arts (Howard Lecture).—Capt. H. R. Sankey on "Heavy Oil Engines."—I. 8 p.m.

The Surveyors' Institution.—Mr. G. T. Loben, F.S.I., on "Some Principles in the Valuation of Land and Buildings." 8 p.m.

TUESDAY, APRIL 30.

Institution of Civil Engineers.—Annual general meeting of Corporate Members only, to receive the Report of the Council, and to elect the Council and Visitors for the ensuing year. 8 p.m.

WEDNESDAY, MAY 1.

Royal Archæological Institute.—Mr. Alfred C. Foyer, M.A., F.S.A., on "The Monumental Effigies by Nicholas Stone." With lantern illustrations. 4.30 p.m.

Royal Society of Arts.—Mr. W. Burton, M.A., on "Ancient Egyptian Ceramics." 8 p.m.

Guild of Architects' Assistants.—Annual general meeting, Prince Henry's Room, 17, Fleet-street, E.C. 7.30 p.m.

THURSDAY, MAY 2.

Society of Antiquaries.—8.30 p.m.

The Institution of Electrical Engineers.—Discussion on "The Causes Preventing the More General Use of Electricity for Domestic Purposes." 8 p.m.

SATURDAY, MAY 4.

The Royal Institution.—Professor Reginald Blomfield, A.R.A., M.A., F.S.A., on "The Architecture of the Renaissance in France, 1494-1661." III.—"1594-1661: Architecture and France." 3 p.m.

Edinburgh Architectural Association.—Visit to Glasgow: (1) The Cathedral; (2) Mitchell Library.

ILLUSTRATIONS.

The R.I.B.A. Pugin Studentship.

THESE are two of the drawings submitted for the Pugin Studentship, 1911, the author, Mr. Philip Dalton Hepworth, being awarded a prize of five guineas by the Council of the Royal Institute of British Architects.

The Cathedral at Senlis.

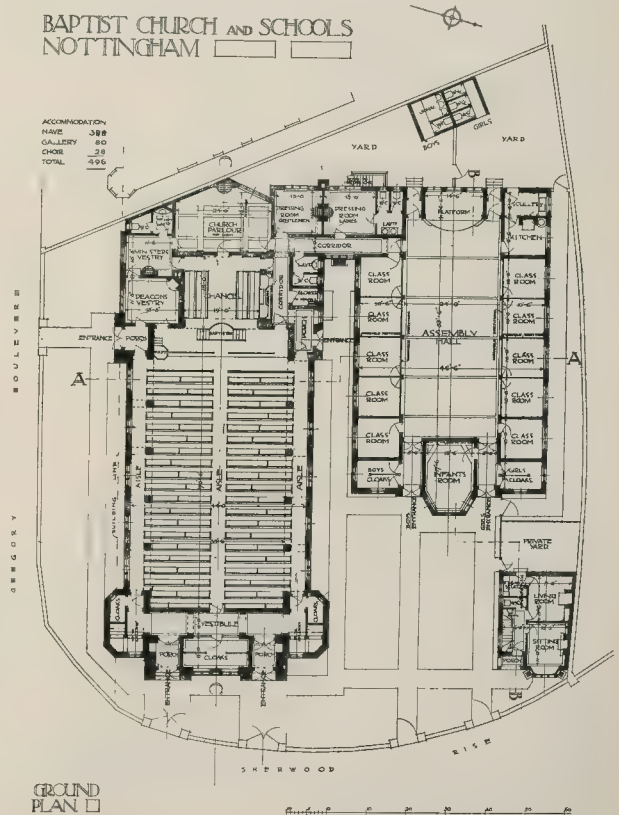
The first Cathedral of Senlis was slowly built from 1115 onwards; the disposition of it can still be made out. The original vaulting is sexpartite. The picturesque Romanesque shafts and carved caps in the interior much resemble those in Auvergne Church. The church was largely remodelled in the Flamboyant period, to which this transept belongs. Here and there is Renaissance feeling. The south-west spire is one of the most perfect in France, and there is exquisite carving in the north façade.

Bury St. Edmunds: The Abbey Gateway.

The Abbey gateway, Bury St. Edmunds, was commenced in 1347 to replace an earlier Norman gate, destroyed in 1327 in riots with the townspeople, apparently sadly frequent in the town of Bury.

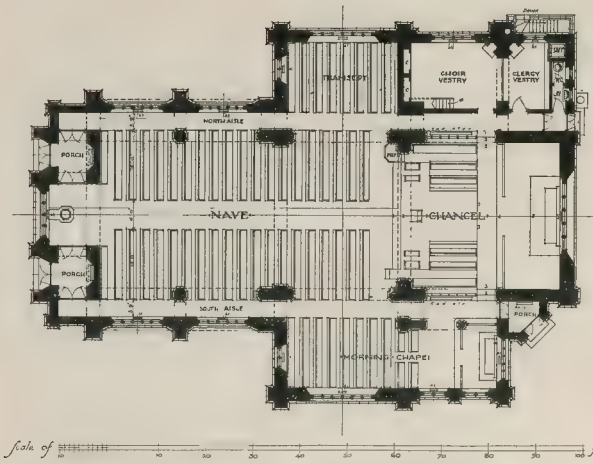
There are three fine bays internally, and fine carving is noticeable everywhere. A most interesting account of the Abbey and the great Abbot Sampson is to be found in the chronicles of Jocelyn of Brakeland, in the end of the XIIth century. Of the great Abbey, once the second in England, only a few fragments remain. The well-known Norman tower was one of the other gates. Interesting Georgian domestic work is to be seen everywhere in Bury, especially charming little shop-fronts, ironwork, etc.

Baptist Church and Schools, Nottingham.



THE design for these buildings was selected by the assessor, Mr. Herbert W. Wills, in a recent competition, and are to be erected on a site at the junction of the Boulevard and Sherwood Rise, Nottingham. The external walling will be in square rubble Bulwell stone in courses averaging 4 in. deep; the stonework to doors, windows, plinths, etc., will be in Ancaster stone.

The internal face of walls are to be finished stucco. The arcade and internal stone dressings are in Bath stone.



The roofs of the church and schools are in pitch-pine, the boarding Carolina pine and covered with hand-made sand-faced tiles.

The doors, seats, and other fittings are to be in Austrian oak. The chancel will be paved with black and white marble. The glazing throughout will be leaded lights.

The heating will be by low-pressure hot water; the ventilation by fresh-air inlet panels placed in the outer walls, and concealed extract ventilators in the apex of the roofs.

By Messrs. Sutton & Cressey.

Second Premiated Design, Church of St. Luke, West Hartlepool.

The church provides a total accommodation for 524 as follows:—Nave, 388; gallery, 96; choir, 40. Accommodation for 400 children is provided in the schools.

The architects are Messrs. Ernest R. Sutton and F. W. C. Gregory, of Bromley House, Nottingham.

Church of St. Luke, West Hartlepool.

In our issue of March 16 we illustrated the first premiated design, that of Messrs. Lofting & Cooper, and now we illustrate the second premiated design by Mr. J. H. Morton, F.R.I.B.A., in the recent limited competition, of which the assessor was Mr. W. D. Caröe. The site of the church is at the junction of Tunstall-avenue and Hart-lane, and the church is to have 500 sittings, with morning chapel. A central tower is to be incorporated in the design, but is only to be carried out as far as the eaves of the nave at present. The building is to be erected in stone.

MAGAZINES AND REVIEWS.

The article by Sig. G. T. Rivoira in the *Burlington Magazine* is mainly devoted to an attempt to establish the date of the church and tower of St. Regulus at St. Andrews as the XIIth century. This has long been a matter of doubt to the antiquaries, and even now we doubt if Sig. Rivoira's conclusions will pass unchallenged, though supported by the following cogent considerations:—

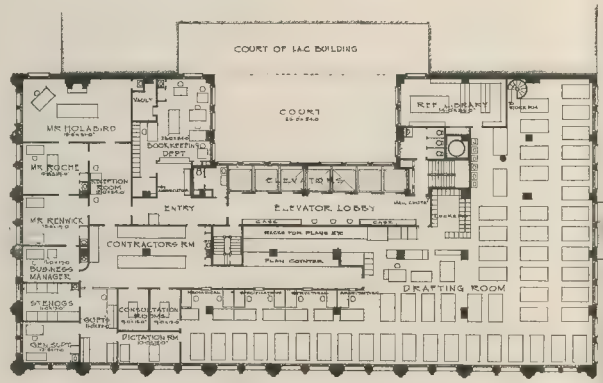
"(*a*) At no time between the VIIIth and the XIth centuries were English, Scotch, or Irish builders in a position to execute such perfect masonry as appears in St. Rule's. My long acquaintance with the ancient remains in these countries justifies me in making this statement. The reverse can only be maintained by arbitrarily giving them earlier dates. In this way a hypothetical date has been ascribed to buildings such as the Round Towers of Ireland, which have been placed at any time between the Vth and XIIth centuries, but, in my opinion, are not older than the Xth or XIth, the oldest (*e.g.*: those of Glendalough, Monasterboice, Antrim) being built of roughly-hewn stones and rubble set in mortar, and provided with very rude openings. Nor is this all, for even in the time of Queen Margaret, the saintly wife of the warlike Malcolm III. (1057-1093), any masons that the Scots could have called in from the North of England would have been incapable of executing the work in St. Rule's. The church towers of Billingham, Jarrow, and Ovingham prove this.

(*b*) In England church towers with multiple windows of artistic form in the bell chamber made their first appearance, to judge from the existing specimens, in the first half of the XIth century, and then only in a rude form like that at Earl's Barton. It is only after the Norman Conquest that they assume a more finished appearance.

(*c*) Engaged angle-shafts at the sides of openings did not appear in these countries before the XIth century. One of the earliest instances is in St. George's Church, Kirkdale (1055-1065)."

The illustrations of decorative sculpture at St. Andrews accompanying this article are of exceptional interest. The series on principles and evolution of furniture-making by Mr. A. Romney Green, of which the first instalment appears in this issue, opens with the consideration of the basic principles of design in regard to materials, and the examples illustrated are given with the intention of enforcing the author's views on the question.

The *Studio* has an article by Mr. Selwyn Brinton on the American sculptor, Daniel Chester French, who is responsible for the large groups decorating the New York Customs House. Recent designs in domestic architecture, a feature in this magazine, include "The Moorings," by Mr. T. E. Collcutt, some work by Mr. T. H. Mawson and Messrs. Parker and Unwin, with illustrations of an architect's house and studio, near Vienna, by Franz Krásny. The other illustrations include several architectural subjects by various artists, ably rendered.



The *Connoisseur* for April starts a series of articles by Ethel M. M. McKenna on the contents of the London Museum. In this first instalment china, domestic utensils, and embroidered clothing are dealt with. Among the notes some interesting examples of old furniture are illustrated.

Mr. Henry Vivian's summary of recent literature on "Garden Cities, Housing, and Town Planning" is a feature of the *Quarterly Review*. Mr. Vivian urges that there should be more co-operation between local authorities, landlords, and builders, so that the best use may be made of land under development. For instance:

"The organisation of London and the urban areas around it is on this matter as unscientific as it could well be. Large sums of money, it is true, have been spent in preparing schemes for main roads, but there is no adequate authority to see them carried out. We have scores of authorities with conflicting aims and interests, each unconsciously—indeed, in some cases, it is suggested, consciously—frustrating whatever effort at improvement the other is making. Take almost any main artery leading out of London. Look at the jumble of property which is being run up on each side of it. In twenty years from now these roads will be in many parts too narrow by from 25 ft. to 50 ft. for the traffic they will have to bear. For the most part they will be shabby and undignified. Widenings will cost more per 100 yds. than they would have cost per mile ten years ago. The part which should have been dealt with, and ought at once to be dealt with, runs through districts which are being administered by perhaps half a dozen different urban public bodies. These have no plan to work to, and there is no central authority to impose any plan on them. Thus the efficiency, the comfort, and the health of a city which in a few years will have a population of ten millions is being sacrificed. Give home rule to localities by all means, but let it be on matters which do not frustrate the good of the whole. For certain large questions which affect Greater London as a whole, including the planning of main and secondary roads, the securing of open spaces, and the general disposition of the area over which the population of London will spread in the next fifty years, there should be a central responsible body, and whatever the local authorities do should conform to its general scheme."

Mr. Vivian's essay is worth reading throughout for its facts and suggestions.

The *Architectural Record* is largely devoted to a long illustrated article on the work, mainly of a commercial character, of Messrs. Holabird & Roche, of Chicago. As being of special interest to the architect we reproduce herewith the plan of this firm's own office, which occupies one entire floor of the Monroe Building. This indicates the scale and organisation of the busy architect's practice in the U.S.A.

Lay-out of Messrs. Holabird & Roche's Offices, Chicago.

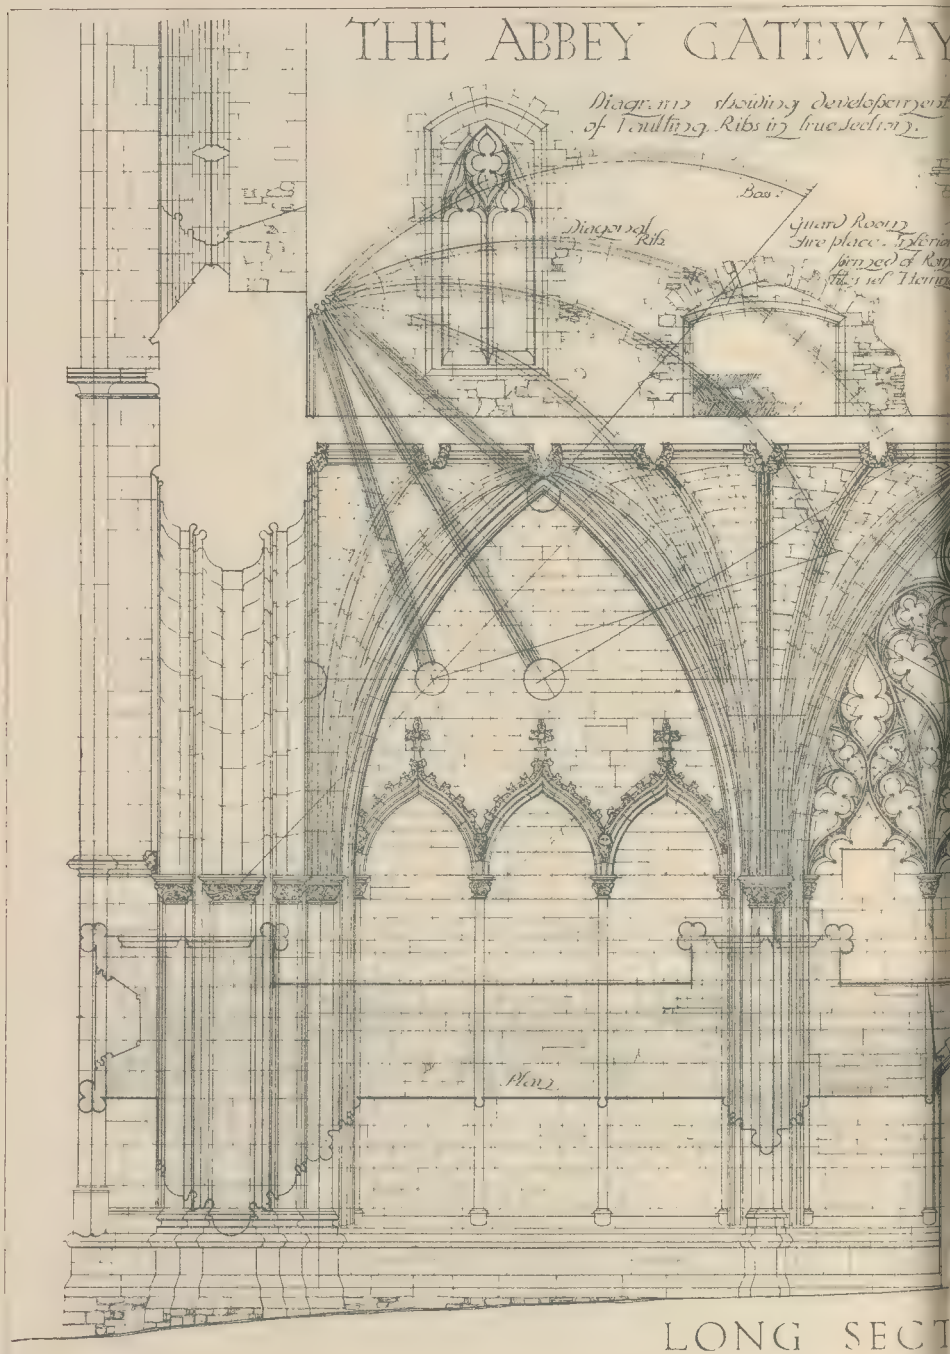
The Albert Memorial.

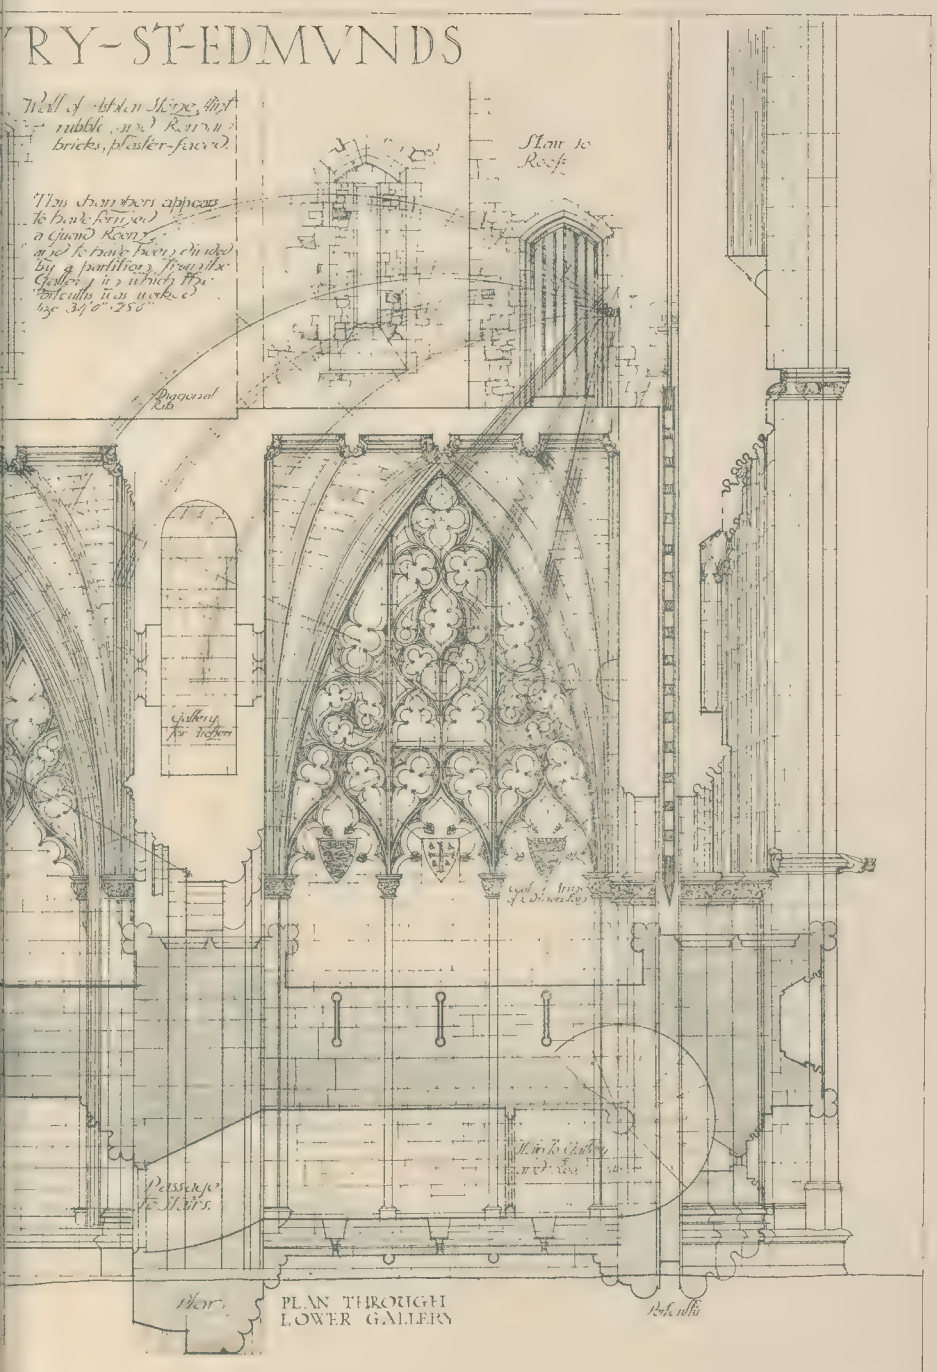
It will have been seen that our intimation of the abandonment of a monolithic obelisk was correct. The Queen's Committee, in their first Report, say of the block of granite which they have been considering:

"The length, which in the excavated portion already exceeds 115 ft., would, we consider, suffice for the intended obelisk. There appears, however, to be reason to apprehend that the width of the stone near the centre would be insufficient, according to the proportions of the most approved ancient examples, to be consistent with that height.



It is also by no means certain that the block referred to has the necessary thickness in those portions which are not yet cleared. An experienced contractor who has examined it has stated that nothing can be affirmed respecting the fitness of the stone 'until it be raised and turned out from its present bed.' For such operations a large outlay would be required; and we cannot but hesitate to recommend such outlay while we have not absolute certainty of a satisfactory result."

Afterwards they say:—



"While, therefore, we see no reason to conclude that success is absolutely unattainable, we believe that it would be accompanied by difficulties and by expenditure at present wholly incalculable. Nor can we refrain from expressing our serious doubts whether, even if the mere enterprise were successful, the ultimate effect would be such as to realise your Majesty's just and natural expectations."

MONTHLY REVIEW · *of* · ENGINEERING.

LIGHTING BY AIR-GAS.

ONE of the difficulties that had to be met, not so much now, however, as a few years ago, was the ifficulty of providing suitable lighting for emote country houses. Where expense was o object and a gas plant could be installed he remedy was simple, or where there was stream or waterfall a water-wheel could e employed to drive an electric dynamo; ut in a great many cases where economy ad to be studied, or water was not provided undantly by nature, the tenants had to e content with oil lamps and paraffin stoves r lighting and cooking.

Although paraffin lamps have of late years een very much improved in design, their se is always attended with grave risks from

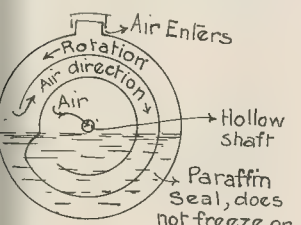

Fig I.

es, many lives, especially children's, having be debited to their employment.

Acetylene was the first attempt at a self-ntained system of gas production, but it ssessed many objectionable features, and st cost and upkeep rendered its general doption impracticable.

For half a century it has been known that trol vapour is highly inflammable, and when nfined and mixed with air was capable of ving a good light, but it has not been until cent years harnessed in such a fashion that can be employed with safety and the nger of explosion overcome.

The idea underlying the production is to intimately mix petrol vapour with air in such proportions that an inflammable mixture is produced and the proportions are 98½ per cent. of air to 1½ per cent. of petrol gas. This is delivered at the gas jets in the ordinary way and will not ignite in the ordinary way, but special burners have to be employed of the incandescent type. This mixture is practically odourless and is non-explosive. If it escapes into the room it is quite harmless, and further, as the air necessary for the light to exist is supplied in the mixture itself, the air in the room is not vitiated, a parallel to the ordinary electric light, and there are no products of combustion which are in any way injurious to furniture or pictures. As the machines producing the gas are small, a constant supply of air has to be provided, and the mechanical parts of the machine have to be carefully adjusted so that this is constant and bears the proper ratio to the volume of petrol vapour employed. For efficient working there are several factors necessary to a reliable machine, and in any machine the fewer the working parts the less the risk from breakdown. The machine being unattended, it must be capable of adjusting itself to the amount of gas required for the number of lights that may be in use. The machine should also be constructed that all the petrol used is properly vaporised with no waste resulting.

The machine should therefore be automatic in action and self-adjusting, and the working parts so simple that little attention is required and no skilled labour necessary once the machine is fixed. The apparatus being self-contained, the motive power should, once the machine has been started, be provided by the apparatus itself.

For this purpose the motive power is usually provided by means of a hot air engine heated by petrol vapour from the apparatus itself, or by means of a falling weight. The tank containing the petrol should be sealed and preferably should be filled by means of a pipe running outside the building containing the apparatus. The petrol is pumped from the tank into a chamber called the carburetting chamber into which it is admitted in the form of a spray, and ultimately mixed with air from an air-propeller. It then passes into a small gas-holder, from which it is delivered to the gas pipes, which may be of the usual type, and used in the ordinary way. The principal idea of all the machines is to pass a sufficient quantity of air into a chamber wherein it becomes properly petrolised to make it combustible.

One maker suggests the following as a standard test to be applied to any air-gas machine, the object being to see whether under varying conditions the supply of air-gas is equal to the demand and of uniform quality.

Run the machine with no burners lighted for five minutes and watch the blue test flame, then with one light burning for five minutes, and observe if the test flame remains uniform, then turn on one more burner and run the machine with two burners on for five minutes, and see if the test flame remains uniform in colour. Continue this up to twelve lights. Then turn on an additional ten at one time and watch the flame and see if it remains constant throughout. Then turn off the lights by tens until twelve remain, and turn off each of these one at a time, allowing five minutes' interval.

If the flame is constant throughout the machine may be considered satisfactory and sufficiently automatic to maintain a uniform quality of gas.

A more severe test is to turn on all the burners for five minutes with the main supply stock cock open, then turn off the main stock cock and see if the machine, after balancing, produces gas of uniform quality under both conditions.

The air is admitted in regulated quantities by means of a Root's blower, or as in the case of the Praed's patent air-gas machine, by a modification of the Wirtz pump. Fig. 1 will help to explain the working of this pump. There are four coils (one shown in section), which dip into a liquid seal. The air enters the outer casing freely, and as the coil revolves and its edge dips into a seal a certain quantity of air is cut off and can only escape through the hollow spindle of the coil, from whence it passes into the lower end of the carburetting chamber. The four coils are arranged so that these openings are at different points on the coil's circumference, so that in a sense there are no dead centres, air is constantly being supplied, the fresh-air trap forcing the air from the previous coil

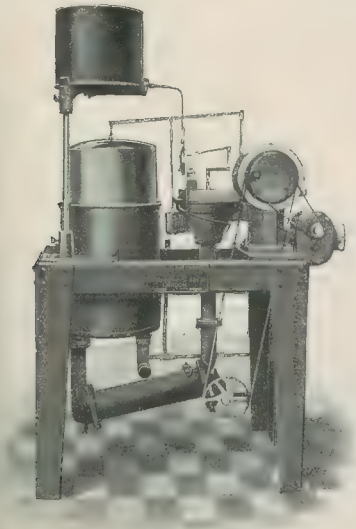

Fig. 2. 30-light Plant (The Machine Gas Company, Ltd.).

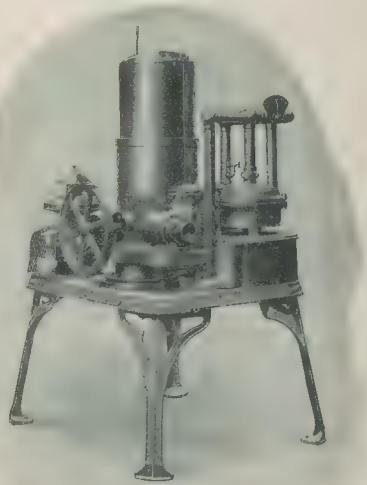

Fig. 3. The "Loco" Gas Machine (The "Loco" Vapour-Gas Light Company, Ltd.).

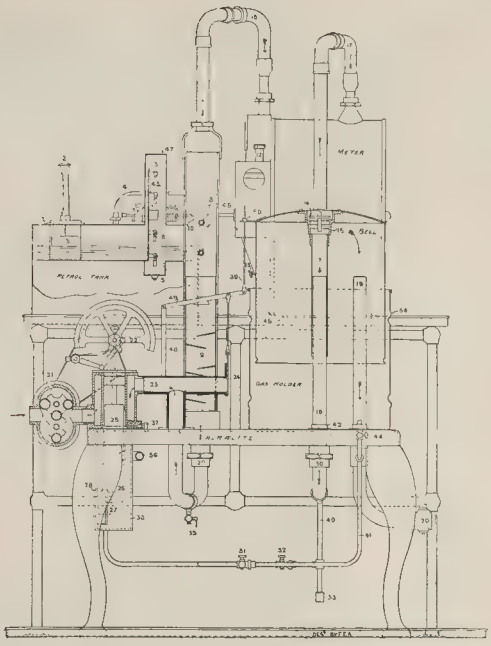

Fig. 4. Machine, by Messrs. Young & Co.

forward through the hollow shaft to the inner drum.

These machines take up very little room, about 3 ft. by 4 ft., and stand some 5 ft. high.

The cost of lighting by air-gas is shown by the following figures given by the "Loco" Vapour-Gas Light Company, Ltd. The prices are for maintaining a 100-candle-power light for ten hours, coal-gas being taken at 3s. per 1,000 cubic feet, electricity 3½d. per unit, petrol of specific gravity 695 at 1s. 3d. per gallon (present price 1s.).

	s.	d.
Acetylene	1	3
Electric incandescent..... .	1	2
Flat flame coal-gas	1	0
Duplex oil lamp		7½
Incandescent coal-gas		2½
Loco air-gas.....		1½

The prices of the machines vary according to the number of lights they are required to supply; a 20-light machine of 2,000-candle-power capacity or 200 cubic ft. per hour costing 31*l*. 10s. up to a 200-light plant giving 2,000 cubic ft. of gas for 200*l*. Cooking can be done by means of this gas by the employment of special stoves, boiling rings, and grillers, oven and stand costing about 5*l*., and rings 6s. each. There is no extra charge made on insurance by the insurance companies for houses in which this gas is used.

The three illustrations, Figs. 2, 3, and 4, show three makes of these machines, of which there are several on the market, and which will give some idea of the arrangements of their parts. Fig. 2 shows Cox's patent, made by the Machine Gas Company, Ltd., of 180, Arlington-road, London, N.W.; Fig. 3, that made by the "Loco" Vapour-Gas Light Company, Ltd., of Newman-street, Oxford-street, London; and Fig. 4 shows Messrs. Young & Co.'s machine, of 161, Victoria-street, Westminster, S.W.

FOUNDATION LOADS.—IV.

A CONSIDERATION frequently arising in regard to foundations is the desirability or necessity of increasing the normal bearing capacity of the soil by one or other of various expedients available.

The most obvious means of attaining the desired result is to increase the depth of the foundation level, for, as a general rule, the compactness of soil increases with distance below the surface in consequence of the superimposed weight. In the course of a discussion on bridge foundations Sir Bradford Leslie referred to the heavy unit loads imposed on the soil by several structures of that class, saying that while loads of from 8 to 11 tons were sometimes objected to as excessive it was simply a matter of depth. Taking the 4¾ tons per square foot on the foundations of Blackfriars Bridge as an example, the speaker said that if the foundations had been carried 100 ft. deeper the weight could have been increased to 9¾ tons per square foot.

While increased depth is often advisable, especially in clay, it must not be forgotten that by penetrating through a hard and dry crust a soft and moist layer may be encountered. In such cases some other alternative should be adopted.

In isolated situations it may be permissible to improve the value of the soil in the direction of load-bearing qualities by drainage, an earthenware drain around the site of the building somewhat below foundation level being usually sufficient for the purpose. But the designer must take care not to do anything that may affect the stability of adjacent structures.

The serious trouble that may be caused by the abstraction of water is illustrated by the well-known case of St. Paul's Cathedral. Many other mishaps which illustrate the sensitive nature of the soil could be cited, but we will only mention two in passing. One is that of a wall in the East India Docks, which, for a length of some 700 ft., moved both laterally and vertically in consequence of an underlying bed of sand having been affected by excavations about ¼ mile distant. Another is furnished by the settlement of a large building in New York owing to the pumping of water on the site to provide water for boiler supplies. It may be pointed out also that the foundations of several heavy American buildings have been affected by excavations at some distance away, but near enough to cause the flow of soft clay from under the footings.

In many parts of the United Kingdom there are places where unstable soil, sometimes of considerable depth, extends up to the surface, or up to the level at which foundation loads are to be carried. The architect then has to decide whether it will be best to adopt a suitable method of consolidation or to employ widespread foundations with the object of reducing the unit load to safe proportions.

Dealing first with methods of consolidation we will mention at the outset an interesting system described by M. Lefebre, and which has been applied with great success on the railway-line between Abbeville and Eu, and notably for treatment of the soil on which were erected various buildings for the new railway-station of Saint Omer, where the ground was of alluvial character with very low and variable resistance. The system consisted in the use of a series of concrete aprons built directly on the ground and loaded with any convenient materials, causing pressure greater than that to be transmitted by the proposed building. As settlement occurred additional loading was added as found necessary. When movement ceased the loading material was removed and the superstructure erected. Simplicity and economy are stated as the advantages of the system, the chief disadvantage being the time lost in waiting for completion of the settlement, which, however, is far more convenient to be dealt with before than after the construction of any building.

Another method of consolidation is to cover the surface of the soil with sand or gravel preferably deposited in a shallow excavation somewhat larger in area than the site of the structure to be built. The chief recommendation of material applied in this manner is that its internal friction and distributing power serve a purpose akin to that fulfilled by spread foundations, and one particularly useful characteristic is the capacity of the layer to obviate the effects of local weakness in the underlying soil. As Sir Benjamin Baker pointed out a few years ago, the bricks, rubbish and other made ground which have formed on the surface of bad ground in old countries itself acts in a manner very similar to that of an artificial sand or gravel bed. Colonel Espitallier, a French military engineer, states the cost of preparing foundations for fortifications on soft mud by spreading a layer of sand at 18s. 6d. per square yard, as against eight times the same rate for piles and six times for caisson work. No rules can be given for computing the requisite thickness of the sand or gravel layer, this being a dimension which should be determined in accordance with individual circumstances.

Sand piles have been used with benefit in many places for consolidating unstable ground. They are readily formed by driving a tube, immediately withdrawing timber piles and filling up the holes with clean, sharp sand, the effect of which is to maintain the compression caused by the process of pile-driving.

Plain concrete moulded in holes formed by driving has also been successfully adopted as an alternative to sand for compacting poor soils, the most recent development of this kind being that known as the Compressed system. That method, which has been employed largely by Continental engineers, requires expensive apparatus, consisting of a movable tower for hoisting and dropping pointed weights upon the site where the soil is to be consolidated. The perforating weight measures about 30 in. across the base, and falling from any desired height of to 70 ft. to 80 ft., not only penetrates the ground, but exerts a powerful compressive effect. When the hole has been carried down to a sufficient depth concrete is rammed into the lower portion by another weight, the effect of which is to force the material laterally into the soil and to form an extended base for the concrete pier. The latter is built up by a similar process of ramming, and varies in diameter at different points according to the resistance of the soil. Therefore, in addition to its consolidation of the soil, the system has the further advantage of providing a series of piers supported in part by a wide base and in part by friction and the mechanical bond afforded by the corrugated sides of the concrete.

Timber and reinforced concrete piles afford means of effecting consolidation in accordance with principles which have been applied in building construction from very early times. In clay and kindred soil short piles are effective for the purpose of increasing the bearing power, but in soft and sandy soil it is sometimes necessary to employ long

driven through the upper strata to a bed arder material. Frequently, however, kin friction of piles driven to refusal ied upon for the support of very heavy

cords concerning the frictional resist- of soils are particularly variable and not ich practical use to those who propose ploy piles for the purpose of consolida- Nevertheless, they are of considerable st as showing the important addition e bearing power which can readily be ed by driving piles into poor ground. m the data collected by Dr. Corthell d that in ten cases of cylinder piers the ge frictional resistance was 540 lb. per e foot, gravel having the maximum of lb., and mud the minimum of 300 lb. twenty-three masonry piers, the fric- resistance ranged from 300 lb. per e foot in sand and gravel to 1,000 lb. per e foot in sand and clay.

king the average value of, say, 560 lb. quare foot of pile surface, we get for in square pile the effective resistance of per foot length. Consequently, it will en that a few piles from 20 ft. to 30 ft. are capable of affording support for very derable loads, which could not be im- on treacherous soil without such aid.

ally, we may appropriately mention er method of consolidation resembling and-layer system in principle, although a form of foundation construction. We particularly to the raft or foundation f reinforced concrete moulded to cover ntire site, transferring the load uni- y to all parts of the soil and constitut- platform upon which the building may id to float. Resting on a raft of this the structure is free from the risk of subsidence, and its entire weight is d in compressing and consolidating the eneath. A certain amount of subsidence ays anticipated and provided for in the s, so no ill consequences follow a small nt of vertical movement.

e design of foundations for different s of buildings to be erected upon soil rying nature is a subject too large for sion in the present review. It is one, ver, deserving special study in the at day, when new methods of building ruction are being developed in all parts e world for structures of almost every The intimate relation between founda- and foundation loads is too obvious for l comment, and we need only add the k that in dealing practically with each t experience and sound judgment are ess important aids than reliable data heoretical knowledge.

COLLOIDAL NATURE OF CEMENT.

MILIAR as cement is to architects and ers, and much as its properties have investigated by engineers and chemists, not yet be said that the nature of this ial is fully understood, or that the tions taking place during its setting and ning are clearly recognised.

ong recent investigators Professor Roh- of Stuttgart, has thrown useful light ese subjects. He shows that in the g of cement two phenomena are evi- d in the initial stage : (i.) The formation lloidal matter which presently coagu- (ii.) the hydrolytic separation of m hydrate, which under the influence bon dioxide becomes calcium carbonate. rst phenomenon is the base upon which he plasticity, expansibility, water-tight- and fire resistance of reinforced con- and the second phenomenon, Professor nd states, is the cause of the non- sion of steel embedded in concrete, and protection against, and absorption of, fforded by concrete.

adaptability of concrete for being ed into varied forms is attributed to lasticity resulting from the presence of lal matter. In order that the plastic rties of cement may be fully developed ecessary in preparing concrete to use an proportion of water, as colloidal sub- are only separate from the cement the addition of water. But it should ted that if all the colloidal matter is lated and all water retained by the results of chemical reactions the concrete loses all plasticity.

Moreover, the presence of colloidal matter is regarded by Professor Rohland as essential to the adhesion bond between concrete and embedded steel. Some authorities attribute this bond to the direct adherence of concrete hardened upon the surface of the metal, others to the grip resulting from contraction of the concrete, and others again to the formation of calcium ferrite.

Professor Rohland considers the cause of adhesion to be rather that colloidal matter disengaged in the presence of steel coagulates instantly with intensity, enveloping the metal and clinging to it energetically. Neither crystalline nor amorphous substances are capable of the same effect and it is the property possessed by cement of assuming the colloidal form, that Professor Rohland believes to be the true cause of the adhesion between concrete and steel.

The impermeability of concrete is likewise attributed to the present of colloidal matter filling up the pores that would otherwise afford facilities for the passage of water. Nevertheless, all mixtures of concrete are not satisfactory from the standpoint of impermeability, a property that can only be attained by proportions which reduce voids to a minimum, and by thorough tamping. Experience shows that concrete need not contain more than 50 per cent. of mortar for properly graded aggregate. The proportion of cement should fill the voids in the sand and be sufficient to form an adequate quantity of colloidal matter at the time of mixing in presence of water. The matter coagulated by the reactions taking place during the setting of the cement acts similarly to glue or size in filling up interstices in the concrete.

Professor Rohland also attributes the low heat conductivity of concrete partly to coagulated colloidal matter, but points out that resistance to fire is not fully developed until water has been completely assimilated and the material has hardened thoroughly. The views to which attention is directed in this article may not have been generally adopted in this country, yet it is worthy of notice that the colloidal aspect of cement has received considerable study on the Continent for years past.

PURE CEMENT CONCRETE AS A LINING FOR KILNS.

MR. VALEUR has found that pure cement concrete possesses many advantages over other materials which have been used as linings for cement kilns. It is only called upon to resist the mechanical wear and tear of the sintered cement mass, which exerts no chemical effect upon it. The concrete is composed of two to three parts by weight of hard burnt cement clinker (the size of grain being from 2 mm. to 2 mm.=0·08 to 0·8 in.) and one or two parts by weight of ground, slow-setting cement, and is mixed with just enough water to cause the mass to cohere when pressed together. When such freshly-prepared concrete is heated to a temperature corresponding to a red or white heat it hardens quickly, remains hard at high temperatures, and retains its form and hardness, whether it be heated slowly or rapidly, in the sintering zone of a Dietzsch kiln in full work. The concrete begins to set in about an hour, and only about as much as can be used in that time is prepared at one time.

By using an iron ring about 40 cm. = 16 in. smaller diameter than that of the kiln as a mould, a concrete lining 20 cm.=8 in. thick can be conveniently rammed into the whole length of a rotary kiln. Such a rim of concrete 2·5 metres=10 ft. wide can be formed in a day and left to set overnight; the next morning the moulding ring is moved and a second concrete rim rammed against the first. Experience shows that no special care is needed in heating the kiln to its full working temperature and condition. A layer of cement concrete only 10 cm. = 4 in. thick, which was tried in the sintering zone of a rotary kiln for a period of fourteen days and then cooled, showed that a thin layer of cement had formed on the concrete and split away again on cooling, and the mechanical wear and tear amounted to 3 cm. = 1·2 in.; otherwise the concrete was intact.

As the molten basic cement does not act chemically on the concrete, it does not adhere to the latter as it does to a fireclay lining, except as to the cohesive effect of the ash contained in the coal used for firing.

A cement-concrete lining will last from three to six months in the sintering zone of a kiln, and is also suitable for the end shoot, which can be relined with concrete in an hour without interrupting the work, whereas relining with fireclay necessitates stopping and cooling the kiln. The concrete answers well not only with rotary kilns, but also with other types, such as the Dietzsch and Schneider. The lining can also be composed of blocks of concrete, kept ready for use, and mortared in with cement. The cost of repairing the concrete lining is much less than that of a fireclay, being only about 3s. 6d to 4s. 2d. per foot, against 68s. 3d. for fireclay lining, and the former is more durable. In actual practice the cost of repairing by the two methods compared as follows, per barrel of cement produced weighing 374 lb. :—

Lining employed in Kiln.	Dietzsch Kiln.	Schneider Kiln.
Fireclay lining...	0·60	0·3
Cement concrete lining	0·08	0·09
Saving per ton of cement =6 barrels, in pence...	3·12	1·26

The process has been adopted in twenty-six works, and is patented in Germany and other countries.

REINFORCED CONCRETE.

A LECTURE on the subject of reinforced concrete was delivered by Mr. E. P. Wells, J.P., Concrete Institute, on March 18, at the London County Council School of Building, Ferndale-road, Brixton, S.W. The following is a summary of the lecture :— The practical side of reinforced concrete, Mr. Wells contended, was of the utmost importance in view of the poor quality of workmanship ordinarily employed. The increase in the use of reinforced concrete since 1900 has been greatly due to the fact that architects, engineers, and others had become convinced of the possibilities of the material. It had been proved to be more economical than steel-frame construction used in buildings, in some cases a saving of from 15 to 20 per cent. being effected. The design of reinforced concrete opened out a great field for efficient instruction therein, which the London County Council School of Building was giving.

In reference to drawings, the lecturer advised the use of single lines, varying in thickness, for showing the reinforcement, the advantages being in preventing confusion, in being more quickly seen, in not tiring the eyes so readily as two lines, and in saving time.

Referring to materials, he stated that cement should be kept free from dampness, cold, or damp air, and stored in airtight bins, and that it should be tested directly it was delivered on the site of the works, and then, if quick use was required, three-day tests should be made. For soundness the Chatelier tests were sufficient.

An instance was referred to of some church foundations where, the cement having been hydrated before use, the concrete showed dampness throughout its entire length, and was easier to excavate after being down twenty years than the clay underneath it. The present-day cement was more liable to hydration than that of twelve to fifteen years ago, owing to its greater fineness. The sand used in concrete should be absolutely clean and free from dirt, and the grains should not be the same size; this would result in the concrete being more homogeneous, impervious to moisture, and stronger. Great care should be exercised in the selection of the water, which should be thoroughly clean and free from vegetable matter and salts that were deleterious to concrete; salt water itself did no harm, but it was advisable not to use it, owing to its hygroscopic nature. The steel employed should conform to the British Engineering Standards Committee's specification, and tests should always be made periodically to ensure that the quality did not fall off. It was advisable to have cubes

of concrete made on a job, and to test them, whatever the time of the year, keeping one set under laboratory conditions, and another under the same conditions as those under which the work was carried out. That would form a gauge as to when the concrete on the works reached the strength required to take up the stresses for which it was designed, so that it should be known when it was safe to remove the centering. The centering should not be made of light material, otherwise on removal it might be found that the sides would have bulged out and settlement taken place throughout the work. This was not only ugly, but required extra expense in plastering. Centering should be so constructed that it could be removed easily without having to cut out the timber. In some cases it was more costly to pull down than to put up. The area of the base plates under struts should be sufficient to carry all the loads on them, or else settlement would occur, which probably result in large sheer cracks in the beams over the supports and destruction of the adhesion between the steel and concrete. Once concrete was put into place it should on no account be disturbed. The centering should be left up for a minimum period of three weeks, except for floor slabs and the sides of beams, which might be removed within seven days, but should the compression tests disclose a low crushing, then the centering should be left in place from four to six weeks, or even longer. Efficient superintendents were essential if the work was to be carried out in the manner designed; lack of attention in this direction often resulted in serious accidents.

Referring to the placing of steel, the lecturer had sometimes employed small concrete blocks, slightly dovetailed in section and lightly reinforced, which were laid at the bottom of the beam casing, thus ensuring that the rods were the proper distance from the bottom and sides of the boxes, and preventing any displacement from the calculated positions required.

The concrete should be of a wet nature to enable it to flow readily round the reinforcement, and to do away with excessive ramming and liability of damage to the reinforcement. An advantage of using dry concrete was that it attained its maximum strength at a much earlier period than that of a wet nature, but at the same time oxidation of the steel might set in, due to the concrete being too porous, and also the adhesion in most cases would be weakened.

If, on removing centering, large aggregate were found on the surface with an insufficient amount of sand, then such portions should be covered with a wash of cement grout, and a one-to-one sand and cement mortar forced into the interstices and finished off with a wooden float. A mistake as regards floor finishing with granite or granolithic was to adopt too high a finish for the work, the consequence being that the initial set was broken up before the surface was completely finished. The remedy was to once trowel the floor and then leave it. But if a smooth surface were required it should be rubbed over with holystone and sand.

After the whole works were completed final testing by loading over at least two bays to an excess of 50 per cent. beyond that for which it was designed was often done. If the work had been carried out efficiently then the deflection of the floor noticed should, after the load had been taken off, be entirely recovered and return to its normal state.

ENGINEERING NOTES.

Reinforced Concrete Chimney at Short's-gardens, Drury-lane.

A CHIMNEY-STACK recently constructed by Messrs G. Trollope & Sons and Colls & Sons, Ltd., to distribute the exhaust from several internal-combustion engines, demonstrates the convenience of reinforced concrete in the design of tall chimneys. The shaft in question is 144 ft. 9 in. high by 5 ft. diameter outside, the flue having the diameter of 2 ft. 6 in. If built of brick and designed in accordance with sect. 65 of the London Building Act of 1894, the chimney would have been at least 12 ft. in diameter, a dimension which was impracticable in this case owing to the small space available. Consequently only two alternatives were open—(1) a self-supporting steel shaft and (2) a reinforced concrete chimney. As the former could not be approved as a permanent structure by the County Council, the latter was necessarily adopted. The following particulars are taken from an article in *Engineering* by Mr. Oscar Faber, A.M.Inst.C.E., engineer to Messrs. Trollope & Colls.

The lower portion of the chimney up to the flue entrance is 1 ft. 3 in. thick, and above that 6 in. thick, with a 5-in. firebrick lining and an air space 4 in. thick between it and the outside shell. Vent-holes near the flue entrance provide for an induced current of air in the space between the lining and the shell.

With the object of counteracting the stresses due to expansion, timber rings are embedded at intervals on the inside face of the concrete shell—a method patented by Mr. Faber and first adopted at the Burham Works of the Associated Portland Cement Manufacturers, where it appears to have been quite satisfactory.

The foundation was taken down 15 ft. below basement level, which itself is 14 ft. 9 in. below ground level, and, as it was necessary to underpin existing walls, it is in the form of a solid concrete block measuring 16 ft. 6 in. by 14 ft. by 15 ft. The firebrick lining consists of special bricks with a raised rib, 2 in. by ⅜ in., fitting into a corresponding recess in the next course; other special bricks with side projections having been used at intervals of 10 ft. apart to keep the lining concentric with the outer shell. About ⅜-in. clearance was left between the projections and the shell to allow for expansion.

Adhesion between Concrete and Steel.

IN the paper on "Reinforced Concrete Columns" read by Mr. W. C. Popplewell, M.Sc., A.M.Inst.C.E., to the Institution of Civil Engineers, a feature is the section relating to the bond between concrete and embedded steel. Tests conducted by the author were made by pulling the end of rods embedded to depths of from 10 in. to 40 in., and the results obtained showed frictional resistances ranging from 243 lb. to 614 lb. per square inch of the surfaces in contact. In the case of the more deeply embedded rods the steel outside the concrete gave signs of failure, while the embedded metal was unaffected and showed no sign of movement. The experiments indicate that the grip of concrete cannot be maintained for long after the steel has begun to yield in tension. As steel is never stressed in practice up to more than about half the yield point there is no reason for fearing slipping of the reinforcement in beams, and it should be noted that in the case of compression bars the effect of stress is to increase the diameter of the steel and so to increase the frictional resistance to slipping.

Arica to La Paz Railway, South America.

THROUGH traffic for the distance of 280 miles is now opened across the Andes by the joining of the rail-ends near the frontier between Bolivia and Chili. The construction of the line was begun by the Chilian Government seven years ago; in 1909 Messrs. Sir John Jackson, Ltd., contracted to complete the works within three years, and to supply rolling stock, for 2,950,000*l*. The railway will be formally inaugurated on August 6. It has the metre gauge and passes through a waterless barren tract by steep gradients, rising to an altitude of 14,000 ft. About 25 miles of the line has a rack-rail.

Yield Point and Elastic Limit.

REPORT No. 56 of the Engineering Standards Committee is a leaflet containing definitions of the terms "yield point" and "elastic limit." It may not unreasonably be thought that such definitions are unnecessary as they are to be found in most text-books on applied mechanics and the strength of materials. But as requests had been made to the Committee for standard definitions they very properly decided upon the issue of the present report. The definition adopted for elastic limit is as follows: "The elastic limit is the point at which the extensions cease to be proportional to the loads. In a stress-strain diagram plotted to a large scale it is the point where the diagram ceases to be a straight line and becomes curved." This definition is not free from objection, for the reason the law of proportionality between stress and strain does not apply perfectly to all materials fulfilling the conditions of elasticity as generally understood, and it would be ferable to define the elastic limit as the poi which a marked permanent set occurs in course of testing. For practical purp however, the standard definition may allowed to pass, because, as the report st it is impossible to determine the limit in ordi commercial testing. The definition adopte yield point is: "The yield point is the p where the extension of the bar increases wit increase of load." It should be noted that point is beyond the elastic limit and is re ascertained by the rapid augmentation of pl deformation that occurs. As the pl yielding of a material destroys its prac value for structural work the yield poi important as fixing a stress limit quite pendent of that determined by applying a f of safety to the ultimate resistance of the material. The definitions may serve the u purpose of emphasising the difference bet the two limits, which are sometimes wro thought to be synonymous.

Tests of "Dentile" System Flooring.

ON March 7 last some f recently constructed on "Dentile" system for Midland Carriage and Wa Works, Birmingham, Messrs. H. Arnold & builders and contractors, Doncaster. subjected to load tests with very satisfac results.

The system in question, which is contr by the Indented Bar and Concrete Engine Company, Ltd., was described and illust in our issue of April 12, where readers find all necessary details.

The first test was conducted upon an app mately square floor, measuring 17 ft. 10 i 16 ft. 7½ in., reinforced in two directions calculated for the working load of 10 per square foot. The test load specified 150 lb. per square foot, or 50 per cent. in e of the normal loading. The material empl consisted of cement in bags, amountin weight to 20 tons, and representing 15 per square foot.

Deflection was carefully measured by a sh vernier placed below the centre of the floor, it was observed that the deflection incre very gradually during the progress of the up to 0·07 in.

While the full test load was still in pos the centre of the floor was exposed by removal of a bag of cement, and five h blows were delivered upon it with a pie timber 18 ft. long by 9 in. by 12 in. in section. This was lifted to a height of 2 f 3 ft. and banged upon the floor by the u efforts of five men. The severe impact had no apparent effect on the floor, in the fo cracks or other signs of damage.

The second test took place on a floor ar 16 ft. 7½ in. by 13 ft. 10 in., reinforced in direction of the shorter dimension only. full test load of 150 lb. per square foot, equ 50 per cent. in excess of the normal caused deflection to the extent of no more 0·01 in.

The successful nature of both the tes sufficient to indicate the reliability of "Dentile" flooring, a convenient featur which is the absence of projecting beams long spans, thus facilitating ceiling treatmen plastering or any other suitable method.

Electrical Wood Seasoning.

A NEW process of wood se ing, which is said to be wo in France, is given in American Consular Re The process is given as foll A large tank is filled with a solution conta 5 per cent. of resin, 10 per cent. of borax, just a trace of carbonate of soda. At bottom of the tank is a large lead-plate nected to the positive pole of a dynamo. this plate the timber is stacked until the ta full. Then another plate is superimposed the timber and connected with the other p the dynamo—the negative one.

The result is that when the current is tu on it passes through the stack of wood, plate to plate, and in its passage it is said the sap is driven out and the resin and takes its place, being deposited in the cell interstices. After this operation is comp the timber is taken out and dried. It is ready for use. The result, it is claime highly satisfactory, for no matter how the timber is before treatment, after treat it is said to be completely seasoned.

THE BUILDING TRADE.

E MODERN BRICKLAYER AND HIS WORK.

LONG-STANDING complaint against trade unions is that they induce the workman to retard progress of his work instead of his employer the full benefit of his . This complaint is so widely made ome explanation of it should be forth- g. The question has recently been dis- with especial reference to the brick- industry, and some persons have had mpression that the unions had pre d rules restricting the number of bricks laid in a day. It does not appear that of this kind have been officially sanc- by any of the unions; but the im- on prevails that trade-union influence sponsible for the alleged tardy per- nce of bricklayers' work.

Cwilt's "Encyclopædia of Architecture" we read that "A bricklayer, with the ance of one labourer, can, if he be so d, lay in one day about 1,000 bricks in on walling, but the trade unions now nt him from laying more than about ird that number." Present-day in- s among builders have elicited the nation given below. It may be re- d that the best results, both in speed uality of work, are obtainable when the er of men employed is small. Careful on of men, personal knowledge of them, ose supervision of their work are more lt when large contracts are under-

lying to inquiries, one builder says he men will not lay more than 300 in a day "unless you watch them." l others concur in stating that 500 is the usual daily average in plain g. An experienced foreman assures us o man can lay 1,000 bricks in an eight- day; the utmost is 500. "You may 0 if you pick your man." An old ayer tells us that he has laid 700 in walls, where the facing forms only a proportion of the work. With another r the average was 500 in forming chim- which, we all know, is "tricky" work; e has known 700 laid quite easily in walls. Another says that he has a l man, paid 1s. 2d. per hour, who can 500 bricks in a day; but the crowning of information comes from a general an, who declares that he has seen two ayers dispose of 7,500 bricks in eight while building a party wall. It is le that some of our readers may en- n us further upon this subject.

t be true that the modern bricklayer ot build at the same speed as his fore- s did, we should be led to expect that re leisurely work would be better done. far does experience confirm this ex- ion? Upon this point we quote the ing observations by a correspondent, pparently speaks from experience:— can judge the brickwork of sixty years hen we see it demolished to-day, and re it with the work that is being ed before our eyes. It cannot, of , be maintained that there was no ' work in 1850 or thereabouts; but yone watch the destruction of walls in l-class building of that date, and he e that the perpends are almost invariably with mortar, while in modern work this her the exception than the rule. Ob- the modern bricklayer building a wall. his last course of bricks he spreads a bed of mortar ready for the next . Each facing brick then receives a of mortar about an inch wide next to ont. All the other bricks are placed the bed without any mortar being l upon them. For filling his perpends ricklayer depends upon grout, which he over the bricks from a tin can. The unless frequently stirred up, is of un- consistency; but at the best, when it is t can only partly fill the perpends, leaving hollow spaces between the bricks, and a certain quantity of superfluous water, which dries out of the wall in time."

The alleged dilatory execution of work, apart from any official action of trade unions, might be expected to result from the existence of an organised combination, which necessarily assumes that all its members are, as workmen, equally competent. Where all are paid alike, the tendency for all is to give equal value for money received, and the doctrine that "every man has a right to an equal share of work" may induce men to leave some work undone for others to do. But a common complaint against the unions is that, while insisting upon an equal rate of wages for all members in any given trade, they afford no guarantee as to the efficiency of the labour to be supplied. Upon this point we may seek enlightenment from the rules of the Operative Bricklayers' Society. Here it is provided that a person desirous to enter the trade must do so before the age of seventeen, and must be legally bound apprentice. A candidate for membership of the Society, if between the ages of eighteen and twenty-one, must be able to prove that he has worked at the trade for three years, if of the age of twenty-two, for four years, and so on in like proportion. Members proposing and seconding a candidate for admission are required to "give such information as to his antecedents as will enable the branch officers to make such inquiries as may be necessary."

Although the last-named rule is open to a somewhat elastic interpretation, it may be fairly presumed that the Society, as at present constituted, does all in its power to ensure that none but competent bricklayers shall obtain membership. But something more than this appears to be needed. Two bricklayers can propose a third for election to the Society, but if all three believe, *e.g.*, that perpends can be properly filled with grout instead of mortar, there is scope for radical reform. We ought to feel that when union bricklayers are employed the highest class of workmanship is obtained, higher than is obtainable from the best of non-union men; and the unions should take a pride in making us feel this. Also, as regards celerity in work, if there is to be an unwritten rule governing the number of bricks to be laid in a day, it should prescribe the minimum rather than the maximum number.

THE MEDIÆVAL CARPENTER.

THE carpenter in the Middle Ages was a well-known member of city and village life. His position was apparently in those days far higher in the social scale than is the case to-day. An instance of a carpenter holding the position of churchwarden of a London parish is to be found in the records of the Church of St. Mary-at-Hill, published by the Early English Text Society. The main details of the will of another London carpenter, Thomas Warham by name, may be seen in Sharpe's "Calendar of Wills." Warham's will was made before 1482, and in it we see that he possessed sufficient property to bequeath a house and four gardens near Cornhill, in addition to other property.

With respect to the work of a mediæval carpenter many remaining records show us that it was, as it is to-day, of a very varied character. We find the following description of some work done by carpenters on a house at Hanworth, near Hounslow, in the time of Henry VIII. The original document is in the Public Record Office (Exch. Acc. 464-19):—

"Carpentares at viid. the day, Workyng as well to fell, hew & square xxii loodes of Elme tymber there felled, also in the workyng of vi loodes of ocken (oaken) tymber of store there lying, the which tymber mad Jyestes, bordes & planckes for stables & loftes to ley hey on; also to make a payre of stayres at the looge & xiiii bedstedes . . . gates, postes, with many other nessessaryes."

The bedsteads would be of the common four-poster and half-tester type.

In a manuscript at the Record Office (Exch. Acc. 474-12) we find set down details of work done in the Tower of London. Here we see that the carpenters employed made "ladders," "cradulles," "handebarrows," and "gynnes."

In MS. 488 22 we see that carpenters worked on windows and carts.

With regard to wages, the carpenter was very comfortably situated, if we bear in mind the fact of the far greater purchasing power of money then than in the present day.

In the erection or repair of a large building a considerable number of carpenters would be employed. Of these the chief warden would be paid at a rate of about 5s. a week and the warden 9d. a day, the ordinary carpenters getting 5d., 6d., 7d., and 8d. Apprentices were paid, according to their abilities or experience, at the rate of 5d., 6d., and 7d. a day. Richard Dee, working near Ewell, in the time of Henry VIII. got only 4d.

In MS. 479-11 is an entry describing the selecting and marking by the master carpenter of certain trees to be cut down. In this work on these trees subsequently the master carpenter received 12d. a day and the rest 6d.

An interesting entry in MS. 488 26 refers to the tools of carpenters:—

"To William Alawe, Watyrman (waterman), for bryngyng the said carpenters and their tulles and instruments."

In 1517 a number of carpenters crossed a ferry every day to get to their work, the fees to the ferryman being paid by the employer. the carpenters crossing every day from May to Michaelmas (MS. 488-16).

An outline of the life of a mediæval carpenter taken from mediæval records was printed in the *Builder* of July 21, 1911.

LONDON MASTER BUILDERS' ASSOCIATION.

A COUNCIL meeting of the London Master Builders' Association was held in the Council-chamber, Koh-i-Noor House, Kingsway, W.C., on Thursday, April 18, when the President (Mr. James S. Holliday) presided.

The President reported that the Special Committee and the Law and Parliamentary Committee had met, and would in due course submit their reports to the Council.

Correspondence relating to priced schedules with tenders, provisional sums in quantities, etc., was read and instructions given.

Various other trade matters of interest were considered.

Messrs. Messers. Ltd.. were elected an Associate member of the Association, and the following firms were nominated for membership:—

1. Messrs. H. J. Carter, Ltd., as ordinary member.
2. Messrs. Bovis, Ltd., as ordinary member.
3. Mr. J. B. Smith, as Associate member.

BUILDING PLANS AND BUILDING PROSPECTS.

SO FAR as the returns of the plans deposited with the local authorities afford any indication of the condition of the building trade and its prospects, the outlook is not promising, and it is to be hoped that labour unrest will not make matters worse. The sum total of all plans deposited in the first quarter of 1912 is 3,487,425*l.*, as compared with 4,093,467*l.* in the corresponding quarter of last year. This is a decrease of 606,042*l.*, or 14·8 per cent. Decreases are shown in every class of building except workshops and factories, and in these the increase is 25·7 per cent. All districts show a decrease with the exception of Lancashire and Cheshire and Yorkshire. The decrease in dwelling-houses is very marked—463,486*l.*, or 23·5 per cent.—and it appears to occur in all districts.

GOVERNMENT CONTRACTS.

THE following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works, Department:* Steelwork for reinforced concrete piles, Devonport—Britannia Reinforced Concrete Engineering Company, Ltd., 196, Deansgate, Manchester; works services; caissons for lock, docks, and basin, Rosyth—Sir William Arrol & Co., Ltd., Dalmarnock Ironworks, Glasgow; foundations for steel oil tanks —Mr. G. Hall, Back Hilton-road, Aberdeen; reinforced concrete pier, R.N.O. Depôt, Crombie—Messrs. R. Bruce & Sons, 25, Greenside-place, Edinburgh; sluices and their roller paths—Sir William Arrol & Co., Ltd. Dalmarnock Ironworks, Glasgow; steel oil tanks—Messrs. Clayton, Sons, & Co., Ltd., Moore End Works, Hunslet, Leeds; three pairs of aeroplane sheds—Mr. W. Harbrow, South Bermondsey, S.E. *Admiralty, Contract Department:* Water-closets and gear—Messrs. Shanks & Co., Ltd., Tubal Works, Barrhead, Glasgow; Messrs. Doulton & Co., Ltd., Albert-embankment, Lambeth, S.E.; Leeds Fireclay Company, Ltd., Wortley, Leeds; Messrs. G. Howson & Sons, Ltd., Eastwood Sanitary Works, Hanley, Stoke-on-Trent; Messrs. Wallace & Connell, 65, McAlpine-street, Glasgow; Messrs. J. Stone & Co., Ltd., Deptford, S.E. *War Office:* Works services: additional story, R.A.M.C. Barrack Block, Shorncliffe—Mr. T. T. Denne, Walmer; aeroplane repair shop, South Farnborough—Mr. W. Harbrow, South Bermondsey, S.E.; airship shed, Army Aircraft Factory, South Farnborough—Messrs. Hill & Smith, Ltd., Brierley Hill, Staffs; alterations to married soldiers' quarters, Winchester—Mr. J. Hunt, Gosport; alterations to recreation establishment, etc., Town Barracks, Exeter—Messrs. Worksop.—Alterations to Wheat-Sheaf Inn for the Worksop and Retford Brewery Company, Ltd.

Wrotham (Kent).—School: Mr. W. Robinson, architect, Caxton Houe, Westminster, S.W.

METROPOLITAN ASYLUMS BOARD.

At the sitting of the Metropolitan Asylums Board on Saturday the following matters were dealt with:—

Long Reach Hospital.—The Finance Committee reported having received from the Works Committee an estimate of 1,500*l.* of the cost of works in connexion with the adaptation of the shore buildings at Long Reach Hospital for smallpox purposes, and certain fire-resisting works in connexion therewith. It was decided to apply to the Local Government Board for authority to incur the expenditure.

Millfield.—The Works Committee reported having instructed Mr. H. Howard, surveyor, of Littlehampton, to prepare a plan with draft, specification, and estimate of cost for the construction of a substantial concrete sea wall for the protection of the Board's sea front at Rustington.

Works.—Subject to the approval of the Local Government Board the following tenders were accepted:—Messrs. Bristowe & Co., 11, Tothill-street, Westminster, 697*l.* 19*s.* 2*d.*, for road and paving repairs at North-Western Hospital; Mr. S. Lane, Wimbledon, 219*l.*, surface drainage works at Park Hospital; Messrs. J. Linfield & Sons, Ltd., Littlehampton, 205*l.* 10*s.*, for painting works at Millfield; Messrs. J. M. Jackson & Sons, Ltd., Blackwall, E., 2,400*l.*, for relaying the upper deck of the training-ship *Exmouth* with teak; Mr. L. Kazak, Belvedere, 2,161*l.*, for works at Long Reach Hospital.

FOREIGN AND COLONIAL.

Building Material, Drainage, etc., Works, Roumania.

The British Acting-Consul at Bucharest (Mr. L. Schondorf) reports that a Bill was presented on March 26 to the Legislative Assembly for the raising of a loan of 30,000,000 francs (about 1,200,000*l.*) for the construction of a new municipal palace and the carrying out of drainage, road, and other public works at Bucharest.

"The Ideal House," Olympia.

THE IDEAL HOME EXHIBITION.

NATURALLY the dominating feature of the Ideal Home Exhibition at Olympia is the "Ideal House" placed in the centre. This house, built from the prize design by Mr. Reginald C. Fry, in conjunction with Mr. H. Clarke, jun., is really a remarkable achievement in construction, having been erected by the builders, Messrs. H. & G. Taylor, in exactly ten days. As regards design, the general proportions are pleasant and satisfactory, though here and there a somewhat fussy bit of detail catches the eye. These, however, seemed to enhance its popularity rather than otherwise. Internally, the same criticism applies. While the general arrangement is good, it would be better suited to a house of somewhat larger size, and the cramped effect is accentuated by the amount of detail employed. A house on this scale should be simpler; flat plaster ceilings give more sense of space than the beam ceilings adopted in this case, and in other respects the detail is too ambitious for the scale of the work.

It must be admitted that the rooms would have looked far better if even ordinary care had been exercised in the selection of the furniture, particularly that on the first floor, where the difficulties of height have been ignored, and wardrobes shot in, too high to stand against the wall, dressing-tables blocking out half the light, and bedsteads leaving only just room to squeeze round them. This unsatisfactory impression it gives cannot in fairness be laid at the architect's door, as the rooms are not a bad size, and could in most cases be comfortably arranged.

Leaving this central feature, we notice a little way beyond a massive and dignified block from the hand of Mr. Robert Atkinson which houses the various types of heating apparatus exhibited by Messrs. J. F. Phillips & Son. The warming systems are two in number: (*a*) The "Economiser" system of central heating by moist warm air, illustrating the method of warming, cleansing, and humidifying the air supplied to a building for combined warming and ventilation; (*b*) the "Aero" system of central heating by hot water, showing the very small pipes required.

Methods of automatic control are also shown:—(*a*) Automatic control of the air admitted to the building by the "Economiser" apparatus; the temperature being controlled by a liquid thermometer placed in a room, opening or closing ventilators, when the temperature reaches predetermined points. (*b*) The temperature of the water in the "Aero" system controlled by a similar thermometer fixed in the same position.

Near this is Messrs. Cornes & Haighton's well-known "Model Cottages" combination. It is fitted between the kitchen and scullery, economising space, coal, and labour. The copper is heated by the kitchen fire, providing a supply of hot water to a porcelain enamel cast-iron bath in the scullery bathroom. The heat from the kitchen fire passes round the radiating front and back of the copper, and the copper is accessible from the scullery. Hot water, which is on the low-pressure system, can be drawn in the scullery for domestic purposes.

Not far away, in the south-west corner, is the exhibit of the Interoven Stove Company, whose neat little range secured the highest award for improvements in house fittings at Gidea Park. This register grate can be converted in a few seconds into a complete cooking range with oven, boiler, and hot plate.

The Coalbrookdale Company and the Eagle Range Company show selected types of ranges, and Messrs. Bratt, Colbran, & Co. patent "Heaped" fire, with various design interiors and mantels.

Examples of the Falkirk Iron Company's m factures specially applicable to domestic coo and heating include the "George" ra Barker's Generator, in two sizes, the pate A. H. Barker, B.Sc., B.A. (Lond.), an exce system of heating small houses—one fire thoroughly heat a villa at absolutely mini cost; the "Era" anthracite stove in sizes; the "Pelham" fire grate; and a ho controlled-combustion stove burning ordinary coal, anthracite, or coke.

and Decoration Section will be noticed also the exhibit of the Silicate Paint Company.

Messrs. Sissons Brothers & Co. show rooms, decorated in Hall's distemper, as follows:—

In the dining-room the beams supporting the ceiling are stained dark oak, and the panels between the beams are covered with a stencilled design based on the vine, with a Scottish heraldic shield placed so as to form a diaper over the whole ceiling. The design was first stencilled on a ground of neutral brown of medium depth, in light shades of purple pink for grapes, yellow-green leaves, and bright brown stems; the background was afterwards stencilled in soft greenish-blue, leaving an outline of the original neutral brown running along each side of the design, and close to the beams is a narrow border showing at intervals a chequer of black and brown. Over the mantelpiece, in the centre of the room, is shown "Autumn," a seated figure. Around the frieze pass figures of young women and young men beneath trees laden with fruit, some dancing, others carrying baskets of gifts and fruits to "Autumn." The *motif* in the boudoir has been taken from the peacock. On a wide frieze is a free design of peacocks and blossom, painted after the Japanese manner on a cream-coloured ground. The walls are panelled with wood, stained grey. The panels are heliotrope. The ceiling is geometrically panelled. A simple stencil is on the big circle close to the edge.

The effect aimed at is one of delicacy of colouring, freedom of treatment, and airiness.

Messrs. Arthur Sanderson & Sons show a room decorated in a simple manner, as a background for pictures or rich materials. The samples displayed consist of the choicest silk flocks, chintz patterns, leathers, and imitation silks. All the doors are of Gilmour construction.

Messrs. Thos. Parsons & Sons exhibit includes "Endelline" and "Endelflat" enamels, varnishes, and other materals for use in artistic decoration; their stand has been designed primarily to show off to the best advantage a selection of the new "Trans-ol" friezes. Within the stand is a large apartment in which a complete scheme of decoration—including a "Trans-ol" frieze—is carried out in detail.

These friezes are really transfers executed in oil-colours. They can be applied to any washable surface; and after the paper backing has been moistened and stripped off they have the effect of hand-painted friezes. Architects will, we think, welcome "Trans-ols," as their own designs for ornamentation can be transferred and the whole scheme of decoration thus kept absolutely under their own control.

The materials employed in the decoration of the "Ideal House"—"Endelline" enamel, "Opako" lead-free undercoating, varnishes, stains, and colours—were supplied by this firm.

The panelling and parquet flooring shown by Venesta, Ltd., give an indication of the possibilities of this useful material; and next to this, close to the main entrance, are some interesting models of houses to ½-in. scale by the following architects:—Mr. G. J. Hagger, Mr. H. G. Cherry, Mr. De Lacy-Aherne, Mr. A. C. Morris-Edwards, Messrs. R. C. Fry and H. Clarke, jun., Mr. B. Berkeley Wills, Mr. H. W. Pye, Mr. G. E. Clare. The five first named have been executed by Mr. John B. Thorp.

Messrs. D. Anderson & Son, Ltd., with their "Marosa" wall lining, like marble, have an attractive exhibit in the Sanitation and Ventilation Section. Here also are to be seen bath-rooms and fittings from the Farringdon Works (Messrs. Pontifex & Sons); the Lion Range (with improved raising fire and new design of boiler fine), by Messrs. McDowall, Steven, & Co.; porcelain-enamelled baths, etc., by Messrs. O'Brien, Thomas, & Co.; grates, a new slow-consumption range, mantel registers, and cognate fittings by Messrs. Wilmer & Sons.

In the Hygiene and Cleaning Section demonstrations may be seen on the stall of the British Vacuum Cleaner Company, Ltd., who show how efficiently their labour-saving contrivances can be worked.

Not the least interesting section of the exhibition is that devoted to furniture by such well-known craftsmen as Mr. Charles Spooner, Mr. A. Romney Green, Mr. C. F. A. Voysey, Mr. George Walton, Mr. G. Ll. Morris, and others.

Dining-room with Decorated Frieze.

Mr. C. H. B. Quennell, in a brief introduction to this work, makes the following remarks :—

"The craftsmen probably wish that they could have had longer time for preparation; they have been invited to exhibit their work and they have done so. It is not put forward as being at all extraordinary, but it may be taken as voicing the ideals of a group of men who are striving earnestly to maintain craft traditions and do interesting human work. For this reason, apart from æsthetic considerations, it is extremely valuable. That there is any work at all of this sort to be found is wonderful, because it has been produced in direct antagonism to all the economic doctrines of the moment. In certain cases there have been concessions; inasmuch as machinery has been employed in part. Just so much has been done by its aid as would tend to reduce the cost, without too much loss of interest. On the other hand, there are exhibits which are as purely pieces of craft work made by hand on the bench, as those produced by Chippendale and his men, and with the same sort of tools."

A word should be said for the Dutch village annexe which, under the care of the artist, Mr. W. L. Bruckman, is a picturesque and suggestive feature of the exhibition.

THE SCULPTOR'S ASSISTANCE TO ARCHITECTURE.

A MEETING of the Leicester and Leicestershire Society of Architects was held on the 8th ult., in the Room, No. 5, St. Martin's East, Leicester, when Mr. W. Gilbert, of the Bromsgrove Guild, read a paper on "The Sculptor's Assistance to Architecture." In the course of his remarks, which were illustrated by lantern slides, he said :—

"It is not my intention to attempt to express to you more than one thought, or more than one phase of thought, in the development of this vast subject; the argument I shall endeavour to present is that while the architect must be paramount a responsibility as overwhelming in its turn rests with him towards the sculptor. It has been truly said that the country which produced great architects produces great sculptors. History has time and again proved the truth of this assertion. And if our decorative work does not fit our buildings the responsibility rests not with the sculptors, who can only deal with the opportunities given them by the architects, but with the architect who has failed to grasp the immensity of his task, to produce his building in such a manner as to obtain the best from colleagues who are not merely experts in production, but erudite in judgment. I think it is Ruskin who says a great architect must be a great sculptor and a great sculptor a great architect. I do not think this axiom was ever intended to be taken literally, but was intended to convey the absolute necessity for the closest working together of these two in the development of a scheme in minds equally proved in the fine ethics of fitness and taste. I believe that this phrase was intended to convey that there should be the broad basis of learning which would encourage the architect —as at Nancy—to analyse the power of the men at his disposal, seeking those who could most readily enter into the expression of his scheme. Studying the work of Jean Lamour, not only in the screens of Nancy but in the beautiful staircase in the Palace—now the Hôtel de Ville—in the cathedral church, or, again, in the little balconies "ouvrages en araignées," exquisite in beauty of detail and graceful curve, one sees dotted about the town (his own house, Rue de Notre Dame; balconies, Place Royale). I could not help feeling that this triumph of an artist, while obeying the architect in the main lines of the scheme, was yet the result of a man allowed to enter freely into his work with real delight in the expression of the confidence of Emmanuel Heré towards him.

While realising that Heré was the pupil of that great master of elegance, Boffrand, I should be unable to believe that the executed screens could ever be the slavishly copied detail of the architect, even if Lamour did not himself say, "Il faut être de l'art pour comprendre combien il faut de justesse pour profiler et contourner ces pièces"; even if, in addition, the evidence and assertion of Lamour himself or the portrait of the smith—a present from Stanislas—which has come down to us showing the grilles as a background, were wanting as to the part he took in this great scheme. The wisdom of the architect for his own great name was the choice of the artist to assist him, and while Heré planned his Place with great constructive lines—mapping out his scheme to suit to the greatest advantage the powers of the men at his disposal—he sought only to guide with gentlest persuasion his highly-strung and nervous team.

He allowed Lamour to enrich it with the triumphs of the forge; he allowed Barthelemy Guibal and his pupil, Cyffié the Flemand, to charm us with the beauty and originality of their groups of Neptune and Amphitrite paying their court to Stanislas the King; and Joseph Sontgen the Westphalian to adorn with children the Place de la Carrière.

The freedom of his men spontaneously brought happiness and joyousness of expression. This personal accent was obtained not by the delivery of drawings, but by instilling into the men working that peculiar and imperceptible adjustment of their capabilities and knowledge to his guiding hand; and the architect, great in himself, commanded the loyalty of the artists who responded to the architectural conditions awaiting them.

Again, I cannot believe François Gamain, treacherous or weak-minded man as he was, to be merely a transcriber of Gabriel's drawings, and this staircase of the Petit Trianon, most opposite in its characteristic of monotony and formality to the exuberance of Lamour's work, must have been, to a large extent, the work of Gamain's brain though working under the quiet scholarly influence of Gabriel.

He seems to have impressed Louis XVI. to such an extent by his ability as to obtain the friendship that monarch fully bestowed on the smith. A great proof of the smith's competence, for it must be remembered that this friendship was gained at a time when not only Louis XVI., but Marie Antoinette, Mme. de Barry, and, in fact, the members of the whole Court, adopted art as the fashion, and interested themselves in matters of taste, this, too, at the end of a period of 200 years in the cultivation of taste in these same circles. It is hardly likely that such personal friendship would have been bestowed where the man was merely a skilful tool—a mere servant of the architect.

I most emphatically do not wish to be misunderstood. I do not foolishly depreciate the architect's part of the work, for in all periods of large coherent art the influence of the architect has been extraordinarily powerful—I have just shown you it was as great at Versailles as at Nancy. It was as great in the building of the Escorial at Madrid as at Versailles. No one will dispute the importance of the strong personal character of Herrera, but due credit must be given to the Italian Flecha and his Spanish carvers, and Leoni the Milanese, who developed the train of thought originated by this master.

The architect has his province—how great a one it is the sculptor knows. The man who is successful, though, is he who trims his work to the intellect of the men he is working with, seeking their advice and peculiar knowledge, not fettering them by hard and fast suggestions, but sympathetically explaining to them the scheme he desires to work out, the expression he wishes to convey, enthusing them with the same ideas, seeking their knowledge, their experience, their skill in carrying forward the art they, equally with him, love and care for, realising that they, as well as he, did not entirely labour for the love of the wealth it may bring.

I have spoken of the artist at the discrimination of the architect, but am I appealing for too ideal conditions? I think of another instance when in the past assistance was sought of sculptors, and they were not found wanting in their work.

You all know the Landhuis van der Vryen, or, rather, the remnant that exists of that fine building in Bruges by Van der Poele, and you will remember the fireplace in the Council Chamber, before which you will have stood marvelling at its completeness, its richness, and stately beauty. Can anyone fail to appreciate the story it tells of the pomp and magnificence of the rulers of the old Flemish capital when Charles V., the Count of Flanders, was Emperor of half Europe? It expressed pride in ancestry pride in victory, and conquest accomplished. Can anyone look at this and, thinking of the period, doubt its success?

Well, now, this work was the result of competition, but a competition arranged with such scrupulous care and anxiety to get the best work. In these days sculptors were architects and architects were sculptors, but apart from this the competition arranged by the municipality was for the best work, irrespe of price so long as it fulfilled the purpose. know that some fine competitors, archi and sculptors, entered for this competi We learn that the successful compet Lancelot Blondeel, submitted a large dra and that John Roelandts prepared his mo that the decision was arrived at after deliberation, and that all the compet received a recompense for their trouble. mark the scrupulous anxiety to obtain the work—the successful competitor is sent to towns, to study and to consult sculptors experts in material. The herald Toison is consulted. You see the very hi authorities are consulted; the Council con and I would venture to tell you, rightly con that there is absolute necessity if the real is wanted that those most competent to with the work must handle it. Their must be right, it is expert knowledge require, and not merely even skilful work ship. Toison d'Or is consulted, his fee is Would anyone of these counsellors drea going to a man of lesser repute, less erudite, lesser knowledge? No. And why? Be the Council recognise that the resources man of lesser knowledge would be unw of their town, that a fault in heraldry w expose their fireplace to the unspea contempt of those competent to judge. work is not intended to please and satisf most ignorant, but the most learned who view it. Then understand the anxiety equally impelled them to retain the se of the most accomplished sculptors. sculptor's work had to be also the best and accomplished which could be given—Guy Beaugrant was the selected sculptor; it wa a competition of price. Is it difficult to that an error of taste and accomplish on the one part of the sculptor would have just as much an offence to their eyes as in the heraldry?

Is it difficult to realise the royal cont which would have been freely expressed error in heraldry or at a badly carved There is only one right treatment to be and that is in proportion to the knowledg skill of the sculptor. Treatment is gov by knowledge and not by price, and any treatment but the most accomplished shou useless to your purpose. If you cannot this degree do not parody it in your bui and accept the similar medicine the chea eager to dispose of because it is to his g profit, or, rather, I should express it, less in its drugs to produce. In this manner past was good work encouraged. The bad was burnt or destroyed publicly befor sculptor's doors.

I think it will undoubtedly be said thi expression of a sculptor's highest eloq is the avowal of his religion, the confession faith in all its mysteries. Donatello imagined carving the pillars of the market but he gave his finest thoughts to the ser the Church. To anyone who saw the coll of beautiful pictures in Bruges some yea at l'Exposition de la Toison d'Or it would come to them as a revelation of the piety which inspired those painters in a era of a great nation. If this be realise it will be easy to remember that the scu work—the assistance the sculptor gi architecture—is in a large measure still actual position for which the sculptor de namely, in the buildings themselves. The to see the greater part of their work w take ourselves to it, and in the same spirit which animated these sculptors execution of their work seek to learn thoughts, remembering the times and con under which their work was done.

Art seems to me to owe a vast debt statemanship of men like Philip Le Be Colbert. It may have been the pric love of pageantry, or the desire to exce neighbours which urged the rulers in high to encourage the artist, but I cann thinking that it is rather their statesm and far-seeing ideals for the prosperity country which persuaded them in respective periods to such efforts to ma work of their artists known in count and wide. Artists are attracted for the the artistic education and opportun express their art afforded. This happ Milan under the Sforza, when the was being built at Nuremberg, in churches at Florence, in Rome, in Mad have reminded you, at the time of the

anted further authority and spoke of
lo not your thoughts fly to Dürer,
and innumerable others who felt that

their very existence in art depended on their knowledge which was to be sought in lands other than their own and in contact with other individualities?

A school, I feel, works in such harmony that those who acknowledge the direction often excel, not the direction, but the skill of the direction; and in such harmony did these sculptors, Girardon, Adamainé, and Tubi, and the others, work that undoubtedly they often did what Le Brun wanted better than Le Brun could have done it himself; but, on the other hand, there is undoubtedly no design Le Brun did not inspire. And so with the work of Caffieri, Verbeckt, Pajou, Oppenordt, and others. Undoubtedly De Cotte, Gabriel, and Manssart inspired them with the air of grandeur and dignity, that these men gave the touch of life and breathing to the building which M. de Nolhac says contains the condensed genius of a whole race, but which, I would venture to say, contains rather the condensed genius of whole periods of art, and that art the best efforts of the whole of the Western nations.

And as it was at Versailles and in France generally in the XVIIth and XVIIIth centuries so were the sculptors of the Netherland celebrated in the XIIIth, XIVth, and XVth centuries, and both received pupils from other lands, and in return, attracted by the rich rewards offered for the fame of their work, attracted themselves to foreign courts in Spain, Italy, France, Germany, and Sweden.

Finally, may I say a few words as regards a statement which is by no means one free from contempt? One often hears the cry that we are decadent in our art, that reputation is only to be now obtained by copying the old work. We talk about our love for the antique until we are frightened from doing anything fresh. We admire the great masters of the Versailles school, as we should, with reverence and wonder, desiring their work and seeking by every means to obtain it, forgetting that if their work had been treated with indifference that great school could have had no existence. We know, however, that such was not the case, for the work of these men was anxiously waited and credited with due praise, for we have only to obtain the records of the time and we read of the enthusiasm aroused by Coustou and Pigalle—Coustou, who repudiated the abject submission to what were less "idées de la belle antique"; Coustou and Pigalle, whose Venus and Mercury, as Lady Dilke points out, were termed by Mathais Oesterreich (Ersterych): "Les plus belles statues modernes de la collection du roi."

It cannot be said that these men were ignorant of classic art, but they learnt from it and put into it the ideals and life of their time, and so should we, and not be driven to a desire for mere antiquarian accuracy in our rendering of any style, whether Adams, Georgian, Classic, or Gothic. Great and scholarly opportunity provokes great art, and while probably the art of the Greek sculptor will never be equalled, we should be careful not to hastily decry our time. We should examine art and in the aggregate, and doing that I am sure we should find that even in our own miscalled time we are doing something; it is the custom of the day to lament the decadence of the present time and deplore that we have no art of the Greeks or of the Romans, but the word decadence is not to be assumed as the same thing as decay. It is often a misplaced word for evolution or transition between two artistic systems. Carpeaux's work on the Louvre during the Second Empire, Dalou's great group, must be judged by generations to come rather than by ourselves. The work is too close on to our own time.

It may or may not be true that the sculptor's art in the aggregate is decaying. If it be true, then the sculptor must not bear the entire blame, for the sculptor can only work in the opportunity afforded. The sculptor does not determine the style of the period; political and special ideas determine habits, and habits determine style. It may be that the growth of interference of women in the architect's province, which towards the end of the XVIIIth century reached so great a pass, obliterated the architect's desire, and so his keenness for this part of his work.

"A pencil, paper! Quick! I have found a way to build my house!" cried Catherine de Viveonne Marquise de Rambouillet excitedly, as we are told, one evening after she had slept a long solitary in deep meditation. We are told also that her wants being attended to she skotched out a plan; and, lo and behold, so superior was it to all French architectural design of the period that houses were built according to her ideas throughout France! Can you wonder, then, if it be true that architects began to prefer to leave the internal decoration of the house alone, and so cut off at once one of the most important portions in which the sculptor could bring assistance to architecture? It is not given to every woman to have the same strong and perfect taste and perfect understanding of style held by Madame de Pompadour.

Direction is desirable to sculpture, but it must be with knowledge, and that in no slight degree, and the architect must have the courage of conviction even as Gabriel had when he contested Louis XVI. in favour of retaining Boucher's decorations.

We have now to regain, even if we had not to create anew, the cunning which has at various times existed in Great Britain in the skilled workman. There are plenty of resources, and although the task may be difficult, we must not underrate the difficulties when we see the presentation gifts to royalty so atrociously bad in refinement and workmanship. To obtain the standard set by the French Court of the XVIIth and XVIIIth centuries will be hard work; it would be interesting, however, to know whether there was so much wire-pulling then as now, and whether the objects of the local tradesman were satisfied by a commission at the expense of the work. I would rather imagine that the stately beauty of the conception was the first consideration, and that as to whether the local tradesman was benefited in any way by a commission for work which he did not produce was a matter which would have appeared the height of absurdity. To produce a remedy he who would speak the truth must have one foot in the stirrup. If these fungi of commercial traditions are cut away, if once again the artist is considered by the architect not to be the servant humbly carrying out his wishes, but a co-equal, receiving the broad outline and indication of the style desired to be followed in the interior and exterior decoration of his building, I can then imagine that with his restored self-respect that artist will not be found wanting in the wide margin of interpretation such as was allowed to the men in the past whose names have come down to us as the masters of their art. Harden energy into strenuousness and earnestness of labour, and again we shall see men work equal to that of Verbruggens at Antwerp and Brussels. Again great truths silently taught will appear on our buildings.

Again the tomb will not be merely a receptacle to place the dead out of sight. Again the church and the house and the street will contain living thoughts, and artisanship will combine with hope and grow and develop into a living art with that scrupulous perfection of finish which alone can give lasting charm. Again we shall see the veracity of the Greeks, the incomparable grace and delicacy of Hardi and Van Cleve, imperceptibly guided by the hand of the architect, with the personality instilled into them, as I have shown you at Nancy and elsewhere, by that adjustment to their capabilities and knowledge of the guiding hand, arriving at your work with the swift skill and hand of the masters. He is the safest in working who holds firmly to his own sense of what is fitting and lovely in decorative art.

Do not, however, dismiss a thing of its style—there is something beautiful in every style. It is only blindness which prevents its being seen and thought out by iron on iron or iron on stone, the sound of human labour, the smoke of the forge quickening the life pulse of the artist with his art, wife and mistress to him, dreaming of no other pleasure than in the conquest of fine form or the erection of a new and beautiful monument, breaking the marble's stubborn sleep in recovering by strenuous labour and purpose in restless energy and untiring vigilance the splendour of bygone times. And when again, as M. de Perate of the Château de Versailles, says, a Gabriel and a Robert de Cotte arises we shall again have a De Cressert, a Caffieri, and a Gouthière."

SUNDAY-SCHOOLS, NEWPORT.

The Wrenford Memorial Sunday-schools are being erected at a cost of about 3,300*l.* from the designs of Messrs. Habershon, Fawckner, & Co., architects, of Newport and Cardiff. The contractor for the work is Mr. C. H. Reed, of Newport.

LEGAL COLUMN.

Water Supply.

A case, Bristol Guardians *v.* Bristol Waterworks Company, which we noted in the Chancery Division (the *Builder*, November 24, 1911), was carried to the Court of Appeal, where the decision was given on April 1. For some time the Guardians of Bristol had obtained a water supply from the defendant company by measure at the rate of one shilling per 1,000 gallons for use in the workhouses, children's homes, and for offices. Committee rooms, etc., which latter were situated in St. Peter's Hospital. In 1910, however, they claimed a supply at an annual rate under sect. 66 of the Bristol Waterworks Act, 1862, which is as follows:—"The company shall at the request of the owner or occupier furnish to every occupier of a private dwelling house or part of a private dwelling-house . . . a sufficient supply of water for the domestic use of every such occupier at annual rents." There are a number of statutes regulating the supply by this company, and, in addition, the sections of the Waterworks Clauses Act, 1847, are also incorporated, except where they are expressly varied by the provisions of the Private Acts. It is curious that legislation relating to water supply is always so complicated that it almost suggests confusion of thought usually associated with stronger elements. In the present case the Court characterised the legislation as almost unintelligible, and the Court of Appeal were divided. The curious result of the legislation may shortly be stated to be that, although under the Waterworks Clauses Act the owner or occupier of any dwelling-house can demand a supply for domestic purposes on certain conditions, the Private Acts only empower the owners or occupiers of private dwelling-houses to demand such a supply, and contain no provision as to the charges to be levied in other cases. The majority of the Court held that these houses were not private dwelling-houses, and that the owners or occupiers could only claim to be supplied by way of bargain. Lord Justice Fletcher Moulton, who dissented, did not hesitate to say that there was an obligation imposed on the company by the Waterworks Clauses Act to supply water to all houses for domestic purposes, and that if the Acts under which the company obtained its powers contained no provision as to the rate to be paid the householder could demand a supply even without payment, but that as here the plaintiffs had offered to pay the full rate chargeable for any dwelling house they were entitled to judgment.

We cannot part with the case without drawing attention to one point which has a bearing on other Acts of Parliament. Lord Justice Vaughan Williams, in his judgment, is reported as having said:—"Another consideration which weighs with me is this—If the word 'private' is disregarded and treated as of no effect, the owner of every warehouse or factory which requires a small amount of water for sanitary purposes will be bound to pay the water rate calculated on its annual value, in addition to a special charge for any water used for trade purposes. This will throw an enormous burden on the inhabitants of Bristol."

Now, has not this "enormous burden" been laid upon the inhabitants of London by the Metropolitan Water Board Charges Act? In Colley's case (the *Builder*, November 17, 1911) the House of Lords held that in addition to the charge by meter for water supplied to a factory for trade purposes the Water Board could also levy a charge based on the rateable value of the premises in respect of water supplied to the workpeople for domestic purposes, *i.e.*, for lavatories, washing, etc. This decison created no small stir among those carrying on business in London, and has been the cause of agitation; but so far no remedial legislation has been obtained.

The Finance Act: Site Value.

An important decision under the Finance Act has just been delivered in the Scotch Courts. The appellants were trustees under a will of certain property in Glasgow. On the death of the testator a provisional valuation for the purposes of increment value duty was made as minus 545*l.*—that is to say, the total value or gross value was placed at 3,775*l.*, but the assessable site value after the deductions allowed by sect. 25 of the Act (4,320*l.*), left a deficit of 545*l.* The Referee under the Act had accepted the view that this minus quantity represented the original assessable site value under the Act, but all three Judges of the Appellate Court held that in such circumstances the original assessable site value must be held to be nil. They negatived the idea that the Act could be construed mathematically or algebraically, and held that the assessable value must be positive and not negative. The site value represents the owner's interest in the land; that might be nil, but could not be less than nothing. It really seems a self-evident proposition, but we have reason to believe that many valuations have been placed at a minus quantity, and, therefore, publicity should be given to this decision, which is of great importance.

If a minus quantity be accepted and the value of the land improves, or the charges on it are lessened, an attempt would certainly be made on a future "occasion" to claim increment value duty; but from this decision it is clear that until the gross value exceeds the sums to be deducted there is no assessable site value at all under sect. 25, sub-sect. (4).

Trade Union Law.

The Divisional Court has recently, in the case of Thomas *v.* Portsmouth A Branch of the Ship Construction, etc., Association, had to consider the effect of the judgments delivered in the House of Lords in Russell *v.* Amalgamated Society of Carpenters, which we noted the *Builder* April 5 last. In the Portsmouth case the claim was in respect of certain sick benefit which a member of the branch claimed from the union. The union set up the fourth section of the Trade Union Act, 1871, and this raised the question whether or not the society, by its rules, was an illegal society, as it was contended if its objects were not illegal then the protection of the statutes did not apply, and the Courts could entertain the action. This point has been raised in numerous cases noted by us, and notably in the second Osborne case, with which we dealt, the *Builder*, March 24, 1911, and in Gezney *v.* Bristol Trade and Provident Society.

In the present case the Divisional Court held that the rules were much the same as in the case of Russell *v.* Amalgamated Society of Carpenters (the *Builder*, April 5 last), and therefore the society was illegal as being in restraint of trade, and the section applied to take away jurisdiction from the Courts; but the real importance of the decision lies in a point taken before the Court, which was not argued before the County Court Judge. It was said that the recent judgment delivered in Russell's case in the House of Lords laid down the proposition that whether or not the society was an illegal society by being in restraint of trade, yet by reason of sect. 4 of the Trade Union Act, 1871, the Courts were deprived of jurisdiction where "any agreement for the application of the funds of a trade union to provide benefits to members" was being enforced. The Judges of the Divisional Court so read the judgments delivered by two members of the House of Lords.

The judgments in Russell's case have not yet been reported in the "Law Reports," and a full report may throw additional light on the question; but it will be satisfactory if the interpretation placed upon these judgments by the Divisional Court is confirmed.

Readers of our Legal Column must have been struck by the useless litigation that has taken place in determining whether or not the rules of trade unions are illegal as being in restraint of trade, and whether as a consequence members can sue the unions or unions can sue their members in respect of agreements mentioned in sect. 4 of the Trade Union Act, 1871. The matters detailed in sect. 4 relate to the internal arrangements of unions and their members, and although in certain cases, of which Osborne's case was a typical example, members may incur hardship at the hands of their unions without a chance of redress in the Courts, yet it must be remembered that under the Trade Disputes Act the public have been deprived of their legal remedy against the unions where unions or their members commit torts or do certain acts in contemplation or furtherance of trade disputes, and if men join the unions they must take the rough with the smooth; in other words, if they, as members of unions, occupy a privileged position outside the law as regards the general public, they cannot complain if they cannot have access to the Courts when disputes come between the unions and themselves.

The Trade Union Acts of 1871-1876 are in general terms, and we have always failed to see how the distinction was drawn in the Courts between those which have rules in restraint of trade and those whose rules do not infringe that principle.

LAW REPORTS.

Sydenham Dust Problem.

THE problem as to whether a local authority is compelled to collect house refuse from front or back door, according to the preference of the householder, was discussed further at Greenwich Police-court on Wednesday, when the Lewisham Borough Council were fendants on an adjourned summons.

The complainant was Mrs. Julia A. Le No. 1, Collingtree-road, Sydenham, alleged that the Council had failed to c her house refuse after receiving forty-hours' notice on two occasions in Marc

It was agreed that for six years the Co had made the collection from the back but that the dustmen had commenced to to the front on the plea that the road le to the backs of the houses was in a dang state.

Mr. Frank Patteson, solicitor, who i owner of the house, conducted the case fo tenant, and said he had caused the back to be repaired, although he was not liab to do.

Since the first hearing of the case magistrate (Mr. Hutton) had paid a vi the premises. Mr. Ponter, for the Co had agreed to collect from the back d the adjournment without prejudice.

Mr. Ponter now stated that further re had been carried out, and the Council willing, so long as the road was kept in state, to collect from the back.

Mr. Hutton: I should like to tell you is in my mind. So long as the road is i state in which it was when I saw it I the dust is placed in an accessible positi should be very glad to know you had co an amicable understanding. Will you be tent to have the case adjourned *sine d* will Mr. Patteson withdraw?

Mr. Patteson replied that he would co if the Council paid costs.

Mr. Hutton pointed out that there woul be such costs as would have been incur another solicitor had been instructed.

Mr. Ponter offered, on behalf of the Co to contribute 2*l.* 2*s.* towards the costs, bu Patteson declined to accept this, and th was fought out.

William Gawthorne, one of the Co dustmen, gave evidence that the old syst collecting at the back was awkward, and they went to some of the houses they very long way to go.

Mr. Hutton intimated that he coul allow any references to houses other tha one mentioned in the summons.

The Borough Surveyor (Mr. Ernest Putten) said the alteration in collectio made under his orders, as he considere road slippery and dangerous.

Mr. Hutton said he thought the might meet the Council by permittin front door to be used in bad weather, bu on the dates in question there could hav collection at the back. He would fin Council 2*s.* 6*d.* and 3*l.* 3*s.* costs on th summons.

The second was withdrawn.

LONDON COUNCILS.

Battersea.—Various works are to be out to the roadway of Clapham Commo at an estimated cost of 4,170*l.*, which i the provision of a drain, 12 in. by kerbing set on concrete both sides of the and the making-up of the carriagewa tarred slag macadam. The woodpaved ca way of Church-road is to be repaired at mated cost of 630*l.* Repairs are also carried out to four other roads in the B at an estimated cost of 267*l.*

E. Habershon, 30, Green's-end, Woolwich, for the erection of a warehouse at the rear of Nos. 47 and 49, New-road.

OBITUARY.

Mr. E. Hoole.

The late Mr. Elijah Hoole, of "Lastingham," Hornsey-lane, N., was elected in 1869 an Associate, and in 1874 a Fellow, of the Royal Institute of British Architects; last year he was placed upon the retired list of Fellows. Of his architectural works, the following have been illustrated in the *Builder*:—Industrial dwellings in Wentworth-street, Whitechapel, as part of the late Metropolitan Board of Works' scheme for the Goulston and Flower and Dean streets area (November 15, 1886); Red Cross Hall and the cottages, in Little Suffolk street, Southwark (November 9, 1889); Wesleyan Chapel and Schools, Kitto-road, Peckham (June 8, 1889); and the parochial buildings, with parish hall, gymnasium, and school of cookery, in Sewardstone-street, Victoria Park, for the vicar and wardens of St. James the Less, Bethnal Green (October 19, 1901). He was the architect for Toynbee Hall and Lambeth dwellings; Ridley House, with young men's club, residential quarters, etc., for the parish of St. James the Less, Bethnal Green (1904); houses in Glenforth-street and Lower Woolwich-road, Greenwich; the South African War memorial in St. Saviour's Cathedral, Southwark; the restoration in 1891-2 of Wesley's Chapel and House, in City-road, at a cost of nearly 13,000*l.*; the Bermondsey Wesleyan Settlement, Farncombe-street; and the Mission Hall for St. Martin's Church, Gospel Oak (1907).

Mr. C. B. Fox, M.Inst.C.E.

The death, on April 16, in Toronto, is announced of Mr. Charles Beresford Fox, M.A., aged thirty-seven years. Mr. Fox, a member of the firm of Messrs. Wragge & Fox, and elder son of Mr. Francis Fox, C.E., was a grandson of Sir Charles Fox, C.E., and, until lately, a partner of Sir Douglas Fox & Partners. He was educated at Harrow and Trinity College, Cambridge. He was for a while assistant engineer for the extension of the Great Central line from Quainton-road into London, and was then entrusted with the building of the bridge across the Zambesi, at Victoria Falls, for the Cape to Cairo railway. He was subsequently employed upon the Simplon Tunnel, the Nile irrigation works for the Egyptian Government, and many other large undertakings. Last year he married a daughter of Mr. James A. Wheeler, of Merrynook, New Brunswick, New York.

Mr. J. Hogan, M.Inst.C.E.

The death is also announced of Mr. John Poidevin Lemon Hogan, aged fifty-nine years. Mr. Hogan was a pupil in the Thomason Engineering College, Rorkee, and in 1873 entered the Public Works Department of India. Seven years afterwards he was transferred to the railway branch; in 1899 he was appointed a superintending engineer, and in 1901 was made Junior Consulting Engineer for Railways to the Indian Government. Mr. Hogan retired from the service five years ago.

PATENTS.

APPLICATIONS PUBLISHED.*

7,252 of 1911.—James Lees: Manhole and lamphole covers for roads.

7,623 of 1911.—Benjamin Corrick: Road material or road treating material.

8,105 of 1911.—John Murray Leighton: Construction of concrete piles.

8,802 of 1911.—George Bainbridge: Fastening device for use with doors, windows, and the like.

8,925 of 1911. –The Coalbrookdale Company, Ltd., and William Stewart Malcolm: Kitchen-ranges, cooking-ranges, and the like.

9,768 of 1911.—William Henman and William Beasley Heap: Hearths of fireplaces.

10,967 of 1911.—John Robinson Tate and Frank Tate: Apparatus for detecting leakage in pipe lines and the like.

10,978 of 1911.—Arthur Illidge: Sash-fasteners.

12,611 of 1911.—John Leitch: Draw-off tap.

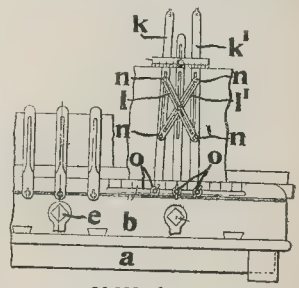
14,795 of 1911.—Carron Company, Thomas Bamforth, and George Pate: Interior or register grates or stoves with movable canopies.

16,032 of 1911.—William Thomas Carling: Boilers and flues for open fire-grates or fire-places.

22,818 of 1911.—Alfred Lill: Door-closing apparatus.

24,125 of 1911.—Clara Nichols: Water-heating fittings for gas and like stoves.

25,628 of 1911.—Wilhelm Siller: Radiators for heating buildings and the like.



27,636 of 1911.—Frederick William Garner: Joints and couplings for pipes and tubes.

29,121 of 1911.—George Baillescu: Valve for mixing hot and cold water or the like.

SELECTED PATENTS.

26,029 of 1910.—William Hulbert and Charles Henry Hulbert: Cutting shaped bricks.

This relates to a machine for cutting a bar of clay expressed from a pug-mill into arch, camber, and other shaped bricks, and com-

26,029 of 1910.

prises a frame *a* carrying clamping-rails *b* with pivoted arms *k*, *k*¹, adjustable by slotted links *l*, *l*¹, and clamping screws *n*, *o*. A bar of clay on a pallet is placed on the frame *a*, clamped between the rails *b*, and a brick is cut off by means of a bow cutter passed externally down the arms *k*, *k*¹. Templets are attached to the arms *k*, *k*¹ for cutting special shapes. The rails *b* are moved towards and away from each other by screwed shafts, and the pallet is moved forward by rack gearing operated by a shaft *e*.

26,471 of 1910.—Coates Downing and Allan Pye: Chimney-tops.

This relates to a chimney or ventilating shaft, which is divided into two or more curved branches, which meet in an open-ended vertical tube above. The branches may be of D or oval section, and the tube may be bell-mouthed, or have two or more funnel mouths or louvers.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv. Contracts, iv. vi. viii. x.; Public Appointments, xix.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

MAY 1.—**Rhos Ruabon.**—PAIR OF WORKMEN'S COTTAGES.—Premiums of 10*l.* and 5*l.* Assessor, Mr. Raymond Unwin, F.R.I.B.A. Particulars from Mr. G. Meirion Griffiths, Rhos Ruabon.

MAY 1. — **Wombwell.**—SWIMMING BATHS.—The Wombwell U.D.C. invite designs in competition for public swimming baths, to be erected in Hough-lane, Wombwell, Yorkshire. Three prizes of the value of 40*l.*, 30*l.*, and 20*l.* respectively are offered for the designs placed first, second and third respectively by the assessor. See advertisement in issue of February 16 for further particulars.

MAY 15. **Portland.**—COUNCIL OFFICES.—The Portland U.D.C invite competative designs and plans for Council Offices. See advertisement in issue of March 8 for further particulars.

MAY 18.—**Hastings.**—SUNK ARENA AND BAND-STAND.—Cost not to exceed 4,500*l.* Premiums, 15 and 10 guineas. Particulars from the Town Clerk, Hastings. See "Competition News," p. 483.

MAY 21.—**Middlesex Hospital.**—DECORATION OF VESTIBULE.—See "Competition News," p. 483.

MAY 22.—**Southend-on-Sea.**—HAMSTEL COUNCIL SCHOOL.—Architects practising in the borough only. Premiums, 25*l.*, 15*l.*, and 10*l.* Particulars from the Education Office, Municipal Buildings, Southend-on-Sea.

MAY 25. — **Lymington.** — PUBLIC OFFICES. — Thirty and fifteen guineas for second and third designs. Assessor, Mr. R. F. Gutteridge, F.R.I.B.A. Particulars from the Town Clerk, Lymington.

JUNE 1.—**Dunfermline.**—INSTITUTE AT NETHERTOWN. Cost not to exceed 7,000*l.* Premiums of 20*l.*, 15*l.*, and 10*l.* Assessor, Mr. E. A. Jamieson. Particulars from the Secretary, Carnegie Trust, Abbot-street, Dunfermline.

JUNE 3.—**Sheffield.**—CRIPPLES' HOME.—Limited to local architects. Mr. E. M. Gibbs, F.R.I.B.A., and Mr. F. E. P. Edwards, F.R.I.B.A., assessors.

JUNE 14. **Regent's Quadrant.**—DESIGN FOR TREATMENT Premiums, 25 guineas and 25 guineas divided. Adjudicators, Mr. E. A. Rickards and Mr. Alan E. Munby. See "Competition News" issue of April 19 (page 453).

JUNE 28.—**Hale, Cheshire.**—TOWN PLANNING SCHEME.—Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale.

JUNE 30.—**Padiham.**—TOWN HALL, BATHS, ETC.—Premiums 40*l.* and 20*l.* Particulars from Mr. J. Gregson, A.M.Inst.C.E., Surveyor's Office, Padiham.

JULY 1.—**Dusseldorf.**—A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

JULY 1.—**Port of London.**—NEW OFFICES.—Limited to those mentioned in "Competition News," issue of April 12 (page 424).

AUGUST 30. — SAXON SPELT PRIZE. — Fifty guineas; with medal, is offered for assay on a hospital subject. Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

OCTOBER 1. **Ottawa.** MONUMENT TO KING EDWARD VII. Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa.

NO DATE.—**Birmingham.** BATHS.—Twenty and 10 guineas for second and third designs. Applications for conditions to be sent to the Superintendent Engineer, Kent-street, Birmingham.

* NO DATE.—**Cardiff.**—MODEL COLLIERY TOWN.—A South Wales colliery company offers a prize of 20*l.* for the best scheme for a model colliery town. See advertisement in this issue for further particulars.

NO DATE. **Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in Competition News, December 1, page 635.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

APRIL 27. **Blackhill.**—HOSPITAL.—For erection of the Richard Murray Hospital. Mr. J. Eltringham, architect and surveyor, Blackhill.

APRIL 27. **Crediton.** — LAVATORY, ETC.—Erection of a dressing-room, lavatory, and covered playground at the school. Plans and specification with Mr. S. Dobell, architect, of Exeter.

APRIL 29. — **Bradford.** — SCHOOL.—Erection of new school for deaf and physically defective children, Lister-lane. Drawings and general conditions of contract seen, and quantities and form of tender from the City Architect, Town Hall, Bradford.

APRIL 29. — **Carluke.** BUILDINGS. The Caledonian Railway Company invite tenders for the construction of new station buildings at Carluke. Drawings at the offices of the Company's Engineer, Buchanan-street Station, Glasgow. Specification and schedule on deposit of 2*l.* 2s.

DESIGN FOR THE FAÇADE OF A PALACE. BY MR. S. CLOUGH.

DESIGN FOR A ROYAL MEMORIAL CHAPEL. BY MR. S. CLOUGH.

Cottage at Letchworth: Garden Front. (*See page* 508.)
Mr. J. Algernon Hallam, Architect.

THE ROYAL ACADEMY EXHIBITION.

ONCE more the circle of the year brings us to the opening day of the Royal Academy Exhibition, nd once more the tacit demand is ade that we shall take stock of the osition of British art as presented to s by its official authority. We may rotest and scoff at the title of the Royal cademy to determine the importance or herwise of any new development, but, ter all, it is only a matter of a few years r the forces of innovation to make eir way to the walls of Burlington ouse, even though it sometimes means far longer period before the innovator is lmitted within the ranks of the great who are selected to guide the artistic destinies of the nation.

In practice the Royal Academy is representative of the general conditions of art—of just a brief four or five years ago—and with this proviso in mind we may fairly regard it as a comprehensive exposition on which to base our conclusions as to British art in our own day.

In one respect we are somewhat handicapped; the differences of individual method probably appear more insistent than they would to a critic of another nationality. Thus we may call to mind the Chinaman's dictum that all Europeans look alike to him, while to the European the Chinamen are, to say the least, all brothers. With our own work we lose the type in the varieties, and find it difficult to pick out this or that as peculiarly representative of the national characteristics in art.

The work of the British artist seems to cover the widest range of eclecticism, embracing the points of view of many schools of other nationalities and other centuries. And this is true no less of our sculpture and our architecture than of our painting. To paraphrase Bernard Shaw, our recognised expert in paradox, the character of British art is that it has no character; we fail to see a definite

trend based on a recognised tradition and aiming at some unity in its development. In a way this variety lends interest, but it certainly does not make for strength and vigour. In comparison with other schools our British art is apt to look amateurish and tentative. Assuredly the individual rises above the mass, and genius from time to time breaks its way through an unfavourable environment, enabling us to look without shame on our art of the past 150 years; but we are not solely concerned with genius. If everything were to be referred to our posterity of the next century, this might be admissible, for by that time the lesser men will have dropped into obscurity and only the few giants will remain. Our arts, however, have another function in relation to contemporary life—a function of expression that cannot be dependent on the few, but must be exercised by all who are engaged on work which, to a greater or less extent, involves the exercise of artistic faculties; and it is among these that our annual exhibitions display a lack of direction in ideal. With the man who paints your portrait, quite as much as with he who designs your country house, it is of the first importance to derive strength from fellow-workers possessing to some extent aims and aspirations in common.

Now it is in this respect that the weakness of British art is most apparent. Mainly owing to the disorganised state of our educational methods, but with other minor causes contributing, we see our art meandering along, philandering with this or that influence, and only too often justifying the criticism that it is nerveless and forceless compared with other schools. It has seemed to us desirable to put these reflections before our readers as the result of a first glance round the walls of the Academy before devoting attention to the study of the work of individuals.

Reserving consideration of other sections for future articles. we shall limit ourselves this week to work of a public character in the Architectural Room. The room this year is hung so as to divide itself simply and clearly into three sections—the wall facing the entrance displaying mainly ecclesiastical work; the left-hand wall domestic work; and the remainder buildings of a public or official character.

Taking these latter in numerical order, we come first to Professor Pite's elevation of the south end of the Burlington Arcade, a design showing a very skilful adaptation of the new first floor to the old ground-floor façade.

Messrs. Belcher & Joass are represented by a shaded elevation of their design for the Royal Society of Medicine headquarters, one of the best we have seen from these hands in recent years, and by other work to which we shall refer later on. Mr. Lutyens's design for the Theosophical Society's building, Tavistock-square, with its two projecting wings and deeply-recessed central block crowned by a dome, forms the subject of a brilliant architectural water-colour by a well-known hand. The rendering of this architect's Johannesburg Art Gallery also suggests a charming group, but on closer inspection the design seems to fall in half and rather to suggest two buildings placed back to back.

Mr. S. K. Greenslade has a delicately-drawn bird's-eye view of his National Library of Wales, and near this may be seen a spirited study for a Royal Memorial from the hand of Mr. E. A. Rickards, of Messrs. Lanchester & Rickards, who also show a sketch of their Edward VII. Memorial, Bristol, backed by the Classic portico of the Victoria Rooms. Four of the designs submitted in the final competition for the Manchester Art Gallery may be seen, namely, those by Messrs. Adams & Holden, Messrs. Warwick & Hall, Messrs. T. Worthington & Son, and Mr. Robert Atkinson, whose huge drawing has a prominent place at the right-hand end of the room. Messrs. Worthington's design bears the palm among these for dignity in its conception and the graceful refinement of its detail.

Professor Pite's design for the Pearl Life building is reminiscent of Greek Thomson in its handling, and is treated generally in a broad and impressive spirit—albeit somewhat freakish in the design of the entrance doorway. We regret that another competition design for this building, by Messrs. Cross & Hubbard, shows signs of haste and lack of consideration in the working out, and a consequent coarseness in detail that is unusual in the work of these architects.

We noticed a detail by Mr. Walter Cave for a building in the Haymarket that struck us as a very satisfactory and well-proportioned design for its purpose. Mr. Ralph Knott sends an interior of the London County Council Meeting Hall, and Mr. Burnet two studies of lifts and staircases in the British Museum. The drawings of the National Museum of Wales by Messrs. Smith & Brewer show numerous improvements on the original competition design. Details of the Lincoln Free Library, by Professor Reginald Blomfield, A.R.A., show a carefully studied and interesting little building, while near it is another library detail by Mr. E. Cooper for his building at Homerton.

A large drawing of Oxford-circus shows its appearance when completed from the designs of Mr. H. Tanner, jun., and a bird's-eye view by Mr. Adrian Berrington shows a project for an "Imperial London," the realisation of which is, we fear, much more remote.

THE PROTECTION OF ANCIENT MONUMENTS.

THE Second Reading of the Ancient Monuments Protection Bill was supported by Lord Curzon in an admirable speech, which appears to us to place the matter in the right light, and to call attention to certain of its aspects which are not perhaps generally recognised by the community at large. As he rightly says:—

"The whole attitude of this country and of the civilised world generally had changed towards archæology in recent years. We, and all civilised countries, regarded these national monuments as part of the heritage and the history of the nation. The case in England was different from that of any other country for the reason that these ancient monuments were dear, not only to ourselves but to our offspring who had gone to our Dominions beyond the seas. They were part of their heritage and part of their historical traditions. The duty of keeping these monuments up was, therefore, not merely a national duty but was almost an Imperia duty. The number of historical monumen was greater in England than in almost any oth country, but they had only to study the recor to see that the number was diminishing fro year to year, almost from day to day. Ever where a certain amount of destruction w wrought by the ravages of time, but even mo was caused by indifference, vandalism, and t heedless utilitarianism of the day. We we far behind any other civilised country in t world, not only the greatest, but even t smallest, in the matter of the preservation these records of the past. In other countri the laws were much more stringent. T Governments took powers to assume t charge of buildings, to superintend and condu repairs, and of compulsory expropriation."

We notice that, apparently to disar criticism, Lord Curzon states that "t Bill did not touch inhabited houses, s that there was no invasion of the sanctit of a man's home." Lord Crewe als "thought the Bill went as far in th respect as public opinion would be willin to go." There is no doubt a difficult here which everyone must recognise ar be willing to make allowance for, but, the same time, it is necessary to reali that many of our most cherished ancie monuments are inhabited houses. It not quite clear to us whether the B permits their owners to pull them dow or to wantonly deface them, so destro ing their historic and artistic interes with no regard whatever to the co siderations so eloquently put forward Lord Curzon simply because they happ to be "inhabited," within the meani of the Act.

No doubt proper care will be taken defining this term, as if the mere presen of a caretaker in an otherwise uninhabit old house is to render it "inhabited," a so exempt from the provisions of the Bi the intentions of the Bill in this respe may easily be frustrated, and many o houses may become inhabited simply evade them.

We hope the Bill will be strengthen in this direction to the utmost limit t public opinion will permit, for, though quite agree with Lord Curzon th broadly speaking, the owners of histo houses have fulfilled their charge in spirit of public duty, yet the danger t he anticipates in the future in simil cases to Tattershall Castle and Temp Bar is equally to be apprehended he The Bill having acknowledged t principle that the right of the individu to do as he likes with his own property subject to the superior right of the Sta there seems no logical reason why t same principle should not apply eve where.

A suggestion, to which we hope pro consideration will be given, was made Lord Barnard that municipal authorit should be given the same powers as w proposed to be given to County Coun with regard to the preservation of anci monuments. There may, of course, other ways of effecting this object, l we are certainly of opinion that so thing should be done to awake interest of the Corporations of cou towns, and to throw upon them so responsibility for the care of the anci national treasures within their wa The apathy and indifference of many our towns is deplorable. If such a to as Banbury, for instance, has not eno civic pride to induce it to acquire preserve a well-known old inn of g historic and artistic value which stituted one of the chief objects of inte

isitors to the town, it seems time that e steps were taken to enlighten its ens. To give a more direct authority he citizens themselves than would be vised by the Council of the county in ch they were situated, might possibly luce good results. Lord Burghclere's estion that the definition of "monu-t" should be so framed as to include able objects is perhaps, in the present e of public opinion, a counsel of per-on; but, all the same, there are relics lected with our former Sovereigns or onal heroes now in the possession of ate owners which public sentiment d never allow to leave this country y legal means existed to prevent it. Bill, as Lord Crewe admits, does not ess to be a very far-reaching measure, we think he is right in his contention it contains elements of real value, there is no doubt that it is the recog-n of a responsibility which the State t long ago to have assumed.

NOTES.

Campanile Venice.

No doubt many of our readers who have naturally been perusing with interest the accounts in the daily of the rebuilding and inauguration ie Campanile at Venice will have astonished at the extraordinary e of the work involved. To be told "as long ago as 1906 the work of ation of the Campanile was recog-as urgent, especially at the south corner, which exhibited manifest of ruin," is puzzling enough when alise that years before that date the anile itself was nothing but a heap st and broken bricks. But as we on with growing amazement of the ing of the vaults of the Paradise Apocolypse, of the accurate and e casts that were taken of every before the scaffolding was erected, e marbles brought from the East he Conquest of Constantinople, and Byzantine Peacocks, we begin to that, with that intelligent interest the daily Press always takes in all rs connected with architecture, it een publishing broadcast a descrip-f the restorations of St. Mark's as if lied to the rebuilt Campanile.

yptian vations.

The results of the first half of the season's work of the British School of ology in Egypt are of unusual st to the architect. A large ery has been uncovered dating he earliest historic age down to the of the Pyramids, and probably ng the position of the northern l of the dynastic race before the ng of Memphis and the reign of

Apart from the pottery, figures, her objects usually to be found in ircumstances, the peculiar interest cemetery consists in the exceptional of preservation of the woodwork, of the beams and poles of the roof being still in position, and the of acacia wood being quite strong ound. As the *Times* correspondent

hough the Egyptian houses of that early ve all perished in the cultivated plain, ne precious pieces of house timber were found reused in the construction of the coffins. These pieces agree with Professor Petrie's explanation of the panelled or recessed decoration in buildings, as copied from timber houses, built of overlapping vertical planks. The planks have rows of tie-holes cut in the edges for lashing them together, so that they could slide one over the other when shrinking or swelling. Some examples were deeply weathered outside and burnt inside, showing that a house had been burnt down and the scraps used as waste for coffin building. We have thus preserved to us the examples of those wooden forms which were so generally copied in the early architectural decoration."

Although the forms of the early Egyptian stone and granite buildings have usually been considered to have developed from the wooden constructions which preceded them, we are not aware that any proof of this theory has ever before been discovered in the shape of the actual wooden remains. As a link in the history of the development of architectural styles this find is of striking importance, and leads us to hope for more from the same source when the results of the second half of the season's work is published.

The Competition for the Australian Capital.

The letter to the *Times* from the Secretary of the Institute should serve to make its attitude quite clear on the question of the competition for the New Australian Capital, and should remove any suspicion that English architects are not enterprising enough to take advantage of such a unique opportunity. Sir George Reid's letter was no doubt intended to convey the impression that the Australian Government are quite satisfied that the jury they appointed would command confidence in Australia; but that is not the question involved when English architects are expected to compete. They expect a jury which commands equal confidence here. We cannot refrain from again expressing our very great regret that an unfortunate position should have arisen which has prevented the best men in this country from taking part in a competition of this unusual interest and importance, and has deprived the Australian people of the advantage of their services. We do not, however, see that this deplorable situation is in any way the fault of the Institute or of the architectural profession. If the Australian Government cannot see its way at the eleventh hour to reorganise the whole competition on reasonable lines, it is at least to be hoped that so unfortunate a fiasco will serve as a warning for the future.

The Institute and the Society.

It is only natural that the rejection by the general body of the Institute of the proposals agreed between its representatives and those of the Society of Architects should cause a certain amount of feeling in the Society, and that this feeling should find expression in the speech of its President at the annual dinner. The whole incident is most unfortunate, and it is also unfortunate that it should be possible for the Council of the Institute to go so far with any measure in ignorance of the fact that it was so utterly opposed to the wishes of so large a number of its members. On the other hand, if these proposals were really acceptable to the majority of the general body, and Mr. Bond's suggestion that the real voice of the Institute was not heard at the meeting, is a true one, it seems equally unfortunate that the Institute is so constituted that proposals put forward by its Council and acceptable to the majority of its members should be at the mercy of a few energetic malcontents who take the trouble to pack the meeting. While it remains necessary to take the decisions of the general body of so large and widespread a Society in a room in which it is physically impossible for a majority of its members to be present at the same time, it is always possible to assert that the true voice of the Institute has not been heard at a meeting, and most difficult to deny the assertion. The Institute appears to have outgrown the arrangements thought sufficient in the original Charter. Although we gather from Mr. Bond's remarks that, so far as the Society is concerned, further progress towards fusion is doubtful, yet we are glad to see that he anticipates cordial co-operation with the Institute in everything that tends to the improvement and essential unity of the profession. This unity, we think, can be best secured by the fusion of the whole of the metropolitan architects in one central Society, and this end is worth some sacrifice on the part of the members of the senior Society. But if this ideal cannot be attained, two societies in harmony are better than two in antagonism.

THE ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

Mr. T. M. Rooke and Mr. Reginald Barratt devote their main attention to architecture in their numerous drawings at the exhibition of the Royal Society of Painters in Water-Colours. Mr. Rooke is perhaps most successful in his treatment of the sculptured screen of the west front of Exeter Cathedral. Much of Mr. Barratt's work is given to Indian subjects, but he appears to be more at home in his treatment of two Venetian scenes. For the rest, building at the exhibition is largely apprehended in its obviously picturesque phases: its ancient castles, its bits of odd thoroughfares, its thatched cottages, surrounded by immaculate and blooming gardens. The show has, however, other claims to interest. Mr. Sargent's sketch "Genoa" is drawn with spirit and freedom and a breadth of style which usually lifts his work into something of the grand manner; in this case it is the grand manner dashed off, as it were. Apparently quickly conceived in splashes of vivid colour, a tangle of vibrating lines, this sketch arrives at a spacious effect with extraordinary technical skill. Mr. Cayley Robinson is only represented by one work "Jeu d'Enfants," painted in his familiar method and with his sentiment for texture: the three figures are balanced in a pleasantly harmonious "arrangement," which is much more than a pose, while it is suggestive and good to look upon. Amid much of the jangle of modern painting the still small voice of Mr. Cayley Robinson, so quietly modulated and so reticently thoughtful in its utterance, the expression of an original and sure vision, becomes, we fear, a little lost. There are some works of symbolic or allegorical intention at the exhibition. Mr. Charles Sims, whose pretty fancy, as we know, delights in splashing cascades, rainbow hues, sombre leafage, and tiny cupids firing darts at fair maidens, is represented by two charming pictures. Mr. Sims's gift of fanciful presentment would seem, however, somewhat to fail him in the realisation of the principal figure in each of these pictures: her pose suggests the model, and her costume a series

Cottage at Letchworth: Entrance.
Mr. J. Algernon Hallam, Architect.

of detached garments evolved in the process of dressing rather than the romantic completeness, or incompleteness, more natural to idylls of this kind. The meaning of Mr. Crocket's large picture, which he calls "Transition," escapes us. We suppose that the infant in the centre provides the key. We might have attempted an exegesis had it not been for the baffling title. In any case, the picture has an unmistakable attraction; the composition, in a way, suggests the procession of the ages, the conflict of *autres temps, autres mœurs,* or other attitudes towards life or systems of thought. Both Mr. Sims and Mr. Crocket have a poetic sense of composition: a lyrical pictorial sense, which gets away from the definite limitations of the merely "subject" picture, and which makes for the higher abstract and decorative qualities in painting. Mr. Anning Bell is more obviously decorative, if not really so, in his Scriptural evocation of the procession to the Holy Sepulchre on the Monday morning; but his six figures suggest neither joy nor lamentation; the spirit of fine, artistic interpretation, even in its purely decorative aspect, is wanting in their formalistic and uninteresting impassiveness. Mr. Walter Crane, in his two Eastern subjects, an "Indian Dance" and "An Indian Air," seems to discover in himself an old or a new talent, which shows to greatest advantage in

ideas lending themselves to decora
detail and ornamentation. We do not q
understand why these two pictures have
hung below the line, while fluffy landsca
with photographic vistas are given place
honour. Mrs. Laura Knight has achieve
breezy success, of the "Diana of the
lands" type, in "The Flight," two girl
the downs watching a flight of birds;
Clara Montalba's schemes of colour in
Venetian St. Mark's and other Ita
scenes possess a peculiar richness
depth of tone which epitomises cer
qualities of the Renaissance painters with
atmosphere of Italy. The exhibition
tains many subjects drawn from N
Africa and the East. The bright sun

The loyal toasts having been proposed by he President and suitably honoured,

Sir G. Laurence Gomme, Clerk to the London ounty Council, proposed the toast of "The ouses of Parliament," and the Rt. Hon. Lord yre and Sele and Mr. L. A. Atherley Jones, .C., M.P., responded.

is Honour Judge Rentoul, LL.D.,

en proposed the toast of "The Society of rchitects," first presenting the President, on ehalf of the Society, with a gold medal as a emento of the high position Mr. Bond occupied the esteem of the members. Proceeding, e said that the nearest occupation to that of n architect was that of a tailor, for both med at the beautification of things in general nd of nature in particular. An architect, ery much like a poet, was born, not made. In ct, an architect was a poet in his own way. s a poet dealt with commonplace words and ranged them in such a position as to thrill eople, so the architect, with stone, brick, etc., s his words, raised buildings that were to be poem in themselves. There was a poetic ement in the calling of an architect more than any other he could think of—and there ad been great and noble architects. Just as ll chimneys were built from within, so the orks of the architect were built from within—he inspiration came from the architect himself. eople might laugh at the Law Courts in the trand, but they must remember that the nfortunate architect had to construct 950 eparate rooms communicating with one nother as directly as possible for the conenience of barristers, and beauty, acoustics, nd everything else had to be sacrificed to peed in getting from one place to another. he true architect was a man who evolved omething from his own brain, and it was not single part of a building which made its beauty, was the whole taken together. A man who onstructed a great and beautiful building ould have difficulty in explaining how e derived the idea. He was told that one of he commonest dangers that an architect fell nto was in doing something near the end hich spoilt the symmetry and beauty of all he rest. What was the chief charm of Egypt, reece, Italy? It was the imperishable works f man—*i.e.*, the works of architecture which e saw.

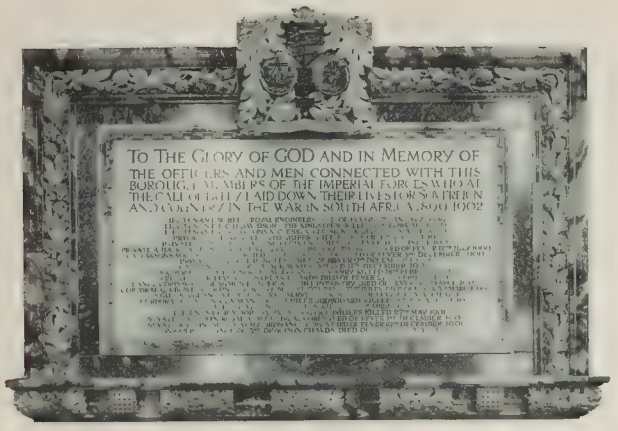
he President,

n reply, said once more it was his pleasure to be ble conscientiously to congratulate his fellow-embers upon the continued progress made y the Society. For many years now the nnual reports had placed on record year after ear a steady and consistent increase in its embership, and also a steady and sure velopment of its financial position. And otwithstanding the suspension of their ctivities during several months, in honourable onformity with the spirit of an agreement ntered into between the Council of the Royal nstitute and themselves, a suspension which eriously handicapped them, their progress uring the last eighteen months had beaten ll previous records. Of course, the success f their efforts during that period might be to ome extent attributed to the fact that they ntered into possession of their new home in edford-square in September, 1910. He ventured to say that the strong and powerful osition to which the Society had now attained oke well for the popularity of the cause ith which it had for so long been identified. hey were entitled to ask what progress there as to report in regard to the Registration ovement since the last annual dinner, and in eply he should be obliged to say, none whatever. For more than a quarter of a century, s pioneers in the Registation movement, the ociety had stood and worked alone, in the ace of the most persistent and unfair opposition, n which opponents brought to bear every onceivable weapon of abuse, irony, and ridicule, ut never once that of practical argument, and in the autumn of 1910 the Society had so far advanced that they had just completed a new revision of their proposed Bill, and had the necessary arrangements for its immediate presentation in the House of Lords. But thoroughly to understand the true position of affairs at the moment it was necessary to recognise the fact that an entirely new situation was created when the Council of the Royal Institute pledged themselves to adopt a Registration policy; for during the whole course of the Society's existence they had been expressing the opinion that such was their duty, and that, should they take up the question and submit a fair and reasonable Bill, the Society should be prepared loyally to support them in their efforts to secure its passage through Parliament. In the circumstances three courses were open to the Society—firstly, to have their Bill presented at once as arranged; secondly, to suspend operations for a time and await the production of the Royal Institute's Bill; and, thirdly, to endeavour to open negotiations with the Royal Institute at once with a view to the production of a joint Bill. Of these, from a tactical point of view, the first was a reasonable one, for in all probability the Bill would, in the House of Lords, have reached the Committee stage; and its opponents would have been compelled to formulate their opposition, chiefly by way of proposed amendments, and, whatever the result, matters would thereby have been materially advanced, for the situation would have been clearly defined and the Society would then have been able accurately to locate the position; but in the face of the previously expressed opinion he felt it was a course they could not honourably follow. The second course would have been extremely foolish, as, after waiting years for the production of the Royal Institute's Bill, they might find that in the interests of the Society and of all others concerned outside the ranks of the Institute itself they should be then compelled to oppose it; and as a matter of fact subsequent events proved that they were right in this assumption, for the claim put forward by the Royal Institute's representatives in regard to the composition of the Registering and Administrative Council, under the Act, was one which the Society as an independent body could not then, nor ever would, agree to, and this really led to the suggestion for amalgamation as a way out of the difficulty, because it was now recognised by the responsible leaders of both bodies that neither could possibly carry a Bill through Parliament if opposed by the other. There remained the third and what he submitted was the only sensible and honourable course, and this was adopted. On November 23, 1910, he wrote to Mr. Leonard Stokes, the President of the R.I.B.A., a personal letter, pointing out very fully his views of the situation, and suggesting a joint meeting of representatives to consider it, undertaking, should the suggestion be favourably received, to forward an advance copy of the Society's revised Bill in order to facilitate discussion. Mr. Stokes and the members of his Council, whom he consulted, were favourably impressed by the proposition, with the result that a series of joint meetings extending over twelve months were held. While for obvious reasons he could not speak about the qualifications of the Society's own representatives on that joint Committee, he ventured to suggest that among those who represented the Institute were some of the most astute, practical, and far-seeing minds in the profession, gentlemen perfectly capable of protecting the interests of the Association they represented, and in whose keeping its honour and dignity were perfectly safe, and who, while keeping their eyes definitely fixed upon the object they had in view, unhesitatingly admitted the justice of many of the contentions of the Society, and met them in a broad-minded spirit, with a view to finally settling a very vexed question. Of course, only those engaged in the actual discussion could possibly know all the reasons which led to the adoption of the scheme, ultimately evolved, which included a fusion of the two bodies, but that it was a fair and reasonable one was, he thought, evidenced by the fact that opponents on both sides objected to it for exactly the same reason—that was to say, both sides claimed that they were making very great concessions and receiving very little in return. After being approved by the Councils and members of both bodies, a legal hitch occurred in regard to the power of the Institute to enter into such an agreement, and the Council immediately set to work upon an amendment to the Charter, with a view to surmounting that difficulty. It was a second time submitted for approval in a meeting at which about a seventh of the Institute's members were present, and which was obviously packed by an organised opposition consisting of junior members. It was referred back, ostensibly upon a side issue about which they cared nothing, and by what was practically an adverse vote the twelve months' ceaseless thought and study given to the subject in all its bearings by their duly appointed representatives, and nominal leaders, had been rendered of no avail, and their broad-minded and far-seeing policy had been left in confusion, and this in the face of their President's remark at the last annual dinner that "if there is any honour in the Institute the agreement will be carried out." No great progressive movement was ever carried to a successful issue without some sacrifice, but the grand ideal of the establishment of that professional unity within one strong institution, which would have rendered all ethical and educational reforms within our ranks much easier of attainment, and would at the same time have positively secured that unity of action in regard to Registration which was essential to success, was apparently, by some of the younger men in the profession, not considered worth even the sacrifice of a little petty pride, for they had no difficulty in assuming that they were perfectly justified in committing themselves to a wrecking policy before they had even heard the other side of the question. The present position was an eminently unsatisfactory one, for the real voice of the Royal Institute had not yet been heard upon the question. Further progress in regard to fusion was under existing conditions a very doubtful quantity, but, in any case, the Society were still prepared to continue negotiations with a view to the production of a joint Bill. During the last few years a much more conciliatory spirit had existed between the Councils of the two bodies, and recent meetings had, he was sure, done much to foster and develop that spirit; and, whatever might be the ultimate fate of the subject-matter they had under consideration, there would always remain that mutual appreciation of each other's honesty of purpose in working for what each conceived to be the best interests of the profession, and he sincerely hoped that it might be the pleasure of both to work together in the future with perfect harmony for the grand purpose of maintaining the honour, dignity, and general standard of ability within the profession at the highest possible level.

Mr. Percy B. Tubbs,

Vice-President, then proposed the toast of "The Guests," remarking on the fact that the Society had always been honoured by the presence of many eminent guests. Although the negotiations with the Institute had not so far been successful, they hoped to be able to work together in the cause of Registration, which they felt would be of great benefit to the profession. The Society, like the Institute, was pledged to a policy of Registration, and failing agreement between the two bodies, both would work to that end, but if there could be a united profession they would stand a much better chance of getting a Bill through Parliament.

Mr. J. S. Gibson,



who first responded, said he should be sorry to think that the work done by the societies would be lost, and he could not think that having gone so far it would not be possible to go further. All things were possible to youth, and certain young men to whom the proposals of the Councils of the two societies had been put incontinently referred the whole matter back; but time would tell its tale, and he believed that he and Mr. Bond were young enough to be found working together for this great consummation of the Registration of architects, and he was certain that it would be with the united body of architects behind them who would be giving their entire support.

Mr. A. Needham Wilson

also responded, and said that the Society had occupied a perfectly logical position and had pursued their objects in a fair and open manner. It had been his hope to see the whole profession united with the object of bringing to an issue this great question of Registration, which was of paramount importance to the profession.

The proceedings shortly afterwards terminated.

D

Dover War Memorial. Designed by Mr. H. T. Edwards.

DOVER WAR MEMORIAL.

THE accompanying illustration shows a memorial to the officers and men connected with Dover who died in the South African War. It has been placed in the Church of St. Mary the Virgin. The tablet was unveiled recently by Lord Roberts.

The whole of the material is alabaster, from Derbyshire quarries. The inscription plate is enclosed in a carved frame, in which appears a grouping of the rose, thistle, and shamrock. The keystone is blazoned with the arms of the borough, and contains a copy of the ancient seal. The Victoria Cross (held by one of those commemorated) is grouped in the centre; the war medals of Queen Victoria and King Edward are also reproduced, with the motto of the borough, "Ville et Portus Dovor." This touch of colour adds to the general effect of the various shades of alabaster employed.

The work was designed by Mr. H. T. Edwards and carried out by the Art Memorial Company, of West Norwood.

THE SURVEYORS' INSTITUTION:

SOME PRINCIPLES IN THE VALUATION OF LAND AND BUILDINGS.

AT the ordinary general meeting of the Surveyors' Institution on Monday Mr. G. Taylor Loban read a paper on "Some Principles in the Valuation of Land and Buildings," of which the following is an abstract:—

"Valuation is an art. Behind it there may be—I hope to exhibit to-night some of the respects in which there is—a science more or less exact. But in actual fact valuation, as practised to-day by the very great majority of the members of the profession, is an art pure and simple. Its exponents have learned what to do and how to do it by practice, by constant touching of the things with which they deal. The promptings of years of experience join with the familarity born of years of experiment, and they together produce a certitude of handling of material in any given case that is quite independent of the consciousness of scientific principle behind.

One might ask who are they and what is it that determine value. On what principle is it that such and such a property is bought at 4 per cent. one year and at 5 per cent. another; or why one class of property commands twenty years' purchase of its rental, while another commands only ten. It is hard to answer. But there is a large number of men, chiefly members of this profession, but including also many who operate on their own account, who are always in touch with the property market—buying, selling, weighing, suspecting, avoiding, and incidentally cultivating an instinct to distinguish exactly how much the times permit them to expect from this or to afford to pay for that. These men, whether acting for themselves or for others, are the property dealers, and I imagine that in the long run it is what they do and what they abstain from that creates a market.

Now the property dealer does not work out with tables the prices he will give for securities. He has bought them a hundred times before, and knows to a pound what any particular one may be expected to yield by way of return on capital outlay. He knows, too, the exact moment at which it is worth his while to buy or sell—whether in relation to other openings in the same market or to the markets in other forms of security. The prices that he establishes become substantially the market prices of the day, and he establishes them out of his knowledge and experience and not by computation from tables. So far then as value is established by the custom of dealing the tables have nothing to do with it. It is when a number of disconnected results are to be compared, and when the conclusions to be drawn from them are to be ascertained, that the necessity of some standard of comparison arises.

It rarely happens that any two transactions are alike in every particular. Some means are needed by which they may be cast into similar form, so that common features may be distinguished and observed. Such means and such a standard of comparison the machinery of the tables is found to furnish.

There is, however, another use to which the tables may be put. By their aid a discussion on value may be carried on, in terms of rental, deductions, and years' purchase, with an ease which would be quite impossible in the absence of this part of the valuer's machinery. Causes of difference may then be detected and so be reduced to issues of fact or of opinion. Inconsistencies may be located and corrected. The exchange of views and contentions may be facilitated.

It cannot be too strongly urged or too closely realised that the rates per cent. and the years' purchase are simply convenient catagories or pigeon-holes into which results may be thrust for subsequent reference, and that when they are used for valuing they represent an attempt to reconstruct the conditions of the market by comparison of convenient standards. Apart from the continued sanction of the market there is no virtue in them.

In practice, and for the sake of convenience, however, valuation is very commonly effected by the machinery of the tables, and it becomes of interest to observe the functions of each of the factors that go to make up such a valuation. These factors are the rent, the deductions, and the years' purchase or multiplier.

The legal definition of rent was well known in the days of the examinations, and has been well forgotten since. The valuation definition of rent is that it is an income arising by the letting of property; it is gross if the maintenance charges on the property are to be met out of it, it is net if it is free of these charges. Frequently, as in the case of a weekly tenancy, it is an aggregate of gross rent proper, and of rates, taxes, and other charges. Rent depends partly on accommodation, and bears a certain ratio to it. An increase of accommodation up to a certain point will mean an increase of rent. The limit is reached when the accommodation goes beyond the means
requirements of the class for which it is intend
or for which alone it can be used. From t
point onwards rent ceases to increase w
accommodation. It has to be remembered th
a rent must be obtained out of means wh
the property itself is an instrument to provi
The amount of rent that a property can sta
will depend less on the extent of the prope
than on the extent of the profitable use
which it can be put. Cases of big premi
at low rents and small premises at high re
will occur to every one. Competition also ten
to raise rents, but only to this limit impo
by the productiveness of the property.

Rent is subject to losses by empties and b
debts. Even a net rent will therefore requ
some further reduction by way of what m
be called contingency provision before it c
be regarded as a secured income. Now, wh
expenditure on rates, taxes, and repairs c
be exactly foreseen and allowed for, allowa
for voids and losses is a matter of experien
and estimate. A very close estimate of t
proper proportion of the total rent to be allow
is sometimes made by observing in the prope
accounts the actual loss per cent. under the
heads during a few past years.

The figure by which the net income is mu
plied—commonly called the years' purchas
depends upon security. It also depends
length of term, but not as a matter of judgme
Whatever tends to add security to the inco
tends also to raise the years' purchase. A
thing that detracts from the security of
income lowers the years' purchase. There
some qualities which affect both rent and secur
Greater desirability tends to throw up re
but when rent cannot be increased it reacts
improve security.

An interesting example of the relation of r
and security as factors in valuation is furnis
by a consideration of the levy of duties ur
the Finance Acts, 1894 to 1910. It will be rec
nised that an important part of the proces
valuation is the determination of the amoun
deductions necessary to arrive at inco
from rent. These deductions usually consis
regular payments made periodically, as rates
taxes and insurance, or of payments m
irregularly at uncertain intervals but allowed
at a certain and definite rate as reparati
In all such cases the deductions are made f
the gross annual produce of the prope
and their magnitude, so long as it lies wi
reasonable limits, tends to reduce the inco
and does not affect the security and ye
purchase. There are, however, other deduct
equally certain in incidence, but very uncer
in point of amount and time, and of these
taxes to be levied under the authority of re
legislation are typical. So far as these
calculable in their amount and the time of t
happening they will no doubt be allowed
by their annual equivalents as charges ages
the income derived from the property. Wh
however, the amount and time of incidenc
not determinable they must be regarde
diminishing the security for the continuanc
the level of income, and to that extent they
be expected to reduce the years' purchase.

Few valuers can be found who would re
valuation as an art of exact application. M
hold it is impossible to value certainly wi
5 per cent. The reason is obvious. Value
thing continually fluctuating. On the one h
it depends on long-continued and grad
operating stresses of a political, social, or
mercial nature. On the other hand it is de
dent on capricious and fitful influences that
from day to day—fashion, some fortunate
dent, an idle market, and so on.

This latter variability, arising one can
guess how, cannot be estimated or allowe
in relation to any individual result. No s
instance of a particular price should eve
quoted as an indication of a market. The
indication, as everyone here knows we
obtained by multiplying the number of tra
tions observed. Casual variability has the
opportunity to cancel out. It is only
observations that extend over a conside
period of time and include a considerable va
of circumstances that conclusions may
drawn which will safely indicate the tren
position of the market.

The great majority of the cases with whic
valuer is concerned relate to land or lan
buildings in various combinations. It
becomes of very great importance correct
appreciate the nature of the component part
the relation of these one to another. I pr

orefore, to present for consideration some sort analysis of the relations of these elements. The movement of the value of land is one of e most regular and gradual. Commencing at practically negligible prairie value it proceeds imperceptible gradations through a value as mmon or waste land, woodlands, to a value as ricultural land, again increasing to an accomodation value to a low building value, and so in certain instances to a high building value. Now consider the effect of development on rise in value. Attention must, however, st be drawn to two important principles. he first of them is, I believe, in direct contraction of a very widely held view. It may be ated shortly thus—that the value of a piece of nd and of the building erected upon it is not cessarily or generally the sum of the value of e land and the value of the buildings taken parately. The contrary opinion forms the undation of much practice, but I hope to show at of itself it is fallacious.

An example will illustrate. A piece of land pable of development for building is worth l. per annum, and being uncovered may be lued at 200*l.* in fee. This is the value of the eeholder's interest. A lessee takes it for a ng term of years and erects upon it a building an ordinary market cost of 500*l.* with a view realising on completion of the building. e building being completed he can sell and n obtain 550*l.* for his lease; the extra 50*l.* ing paid by a purchaser who escapes the ouble and risk attendant upon building specuion. At the same time the freeholder is able sell his interest—now secured—at twenty-five ars' purchase, or 250*l.* The value of lease d freehold together is thus 800*l.* The value the land alone is 200*l.* The value of the ilding as measured by its cost is 500*l.*, and the m of these figures is 700*l.*, or 100*l.* less than e real value of the property.

I anticipate a possible objection by saying at the man who organises the building ansaction may always expect to sell at someing more than the mere cost to him—a mething which will be over and above the yment to the builder and architect. The ility to make a profit forms the basis of all ilding, and without reasonable profit no man willing to work.

The explanation appears to be that every ilding erected on its site represents the sum not two but three things. It represents land; (*b*) buildings; and (*c*) a certain ount of knowledge, industry, enterprise, and k, in addition. These last have their economic lue, and in the instance quoted that value represented by 100*l.*

It is to be presumed that the building erected any moment on a piece of land will represent best and most profitable use that can be made the land. But with the improvement in thods of construction, with changing conceptns of convenient building, with the removal statutory restrictions, it has to be said of the jority of structures that ten years after they built they are not of the latest, most profitle type. In other words, ten years or so er a building is erected there are even better es to which the site of it might be put; the ld is not used quite to its best advantage. long, of course, as there is any substantial lue in the building it would not pay to correct is. An owner cannot afford every ten or enty years to scrap his property because of ne slightly improved method of construction development. So the land remains for the eater part of the life of the building—certainly creasing in value—but increasing less rapidly an if it were free and uncovered.

The effect of a building covenant is much same. A lessee may have a valuable plot land covered by quite inadequate buildings—ildings appropriate perhaps to the very ferent conditions that obtained when they re erected, but entirely inadequate to the dern possibilities of the site. It may be that th lessor and lessee know this. But the sor cannot enter to make the change; and lessee does not find it will pay him to do in view of an ever-shortening term of holding. the meantime the covenants of the lease mpel the maintenance of a particular class buildings on land which has become far valuable for them. In this case also the rease in land value is damped or retarded the circumstances.

To focus discussion I may perhaps be permitted to summarise the principles which I er for consideration:

1. There is a tendency to exaggerate the portance of the tables in the practice of valuation, and in the teaching of that practice the place of the tables should be more subordinate.

2. Values are established by the operations of a comparatively small number of dealers, among whom experience takes the place of tables.

3. Market value is a general deduction from a number of varied transactions, and individual results may be misleading.

4. Valuation is essentially effected by comparison, first for resemblances to establish the class, then for distinctions to differentiate in that class.

5. It is more convenient to discuss valuation in terms of rent and years' purchase than by reference to opinions on the fabric.

6. The use of devices such as the special contingency deduction, whereby the valuer may correct errors due to the necessary use of exact rates per cent. on years' purchase, is legitimate.

7. There is a degree of risk appropriate to every rate of income, and so long as that rate is adopted it is not permissible to reduce the risk by excessive allowances.

8. The value of land and buildings in combination is not necessarily the sum of the values of the component parts taken separately. The difference is partly attributable to the enterprise of the person who combines them.

9. The difference between the value of land considered as wholesale and its value considered as retail is the economic return to the person whose enterprise furnishes the convenience of the small parcel.

10. The obligation to maintain buildings, whether it arises from covenant or considerations of economy, damps the rise in the value of the site.

11. It is possible for a rising market to counterbalance the effect of a deterioration in fabric or of a diminution of a leasehold term, and for a falling market to counterbalance the effect of a physical improvement in the property."

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society.

The annual meeting of the Nottingham Architectural Society was held on Tuesday, April 23. One new Associate was elected. The Council reported that notwithstanding five resignations and one loss through death during the past year the total membership had increased by seven, and now was eighty-eight. They also placed on record their sense of loss of one of their oldest members, Mr. Robert Evans, who had occupied the presidential chair nine times, and to whom the existence of the Society in its early difficulties was largely due. The attendance at the meetings was about the same as the previous year.

The Council had been in consultation with the building trades employers with regard to the difficult problem of specialists and subcontractors, and had also considered the scale of charges suggested by the Royal Institute and the legal liability of architects. They had also brought pressure upon the framers of competitions to ensure fair conditions and reasonable payments.

The statement of accounts showed that notwithstanding increased expenditure the Society was in a sound financial position, and had a balance of over 61*l.* in hand. As the jubilee year of the Society commences next November the Council were asked to consider how best to celebrate it.

Mr. Robert Evans was heartily thanked for his efforts on behalf of the Society during his two years' presidency. The following gentlemen were elected officers for 1912–13:—President, Mr. E. R. Sutton; Vice-President, Mr. H. Gill; members of the Council, Messrs. R. Evans, W. R. Gleave, E. H. Heazell, A. Marshall, H. G. Watkins, A. Dale, and H. A. Dickman; Hon. Secretary and Treasurer, Mr. F. M. Royle; Hon. Secretary of the Designing Club, Mr. W. H. Swann; Hon. Librarian, Mr. R. Spencer; Auditors, Messrs. A. J. Holbrook and J. Woollatt.

BOOK RECEIVED.

MODERN DESTRUCTOR PRACTICE. By W. Francis Goodrich. (London: C. Griffin & Co. 15s. net.)

GENERAL NEWS.

Professional Announcement.

We are informed by Mr. J. Houghton Spencer, architect, No. 5, Hammet-street, Taunton, that owing to impaired health he has disposed of the practice carried on by him at Taunton continuously for forty-four years past to Mr. F. W. Roberts, F.R.I.B.A., No. 2, Hammet-street, Taunton, who will continue to carry on the same at No. 2, Hammet-street, in conjunction with his own practice carried on by him in Taunton for the past twenty years.

The R.I.B.A. Testimonies of Study.

In reference to the alternative scheme of Testimonies of Study for the Final Examination of the R.I.B.A., for the information of students who may not have access to the *Journal* of the R.I.B.A. we propose to publish, as they appear, the subjects for the Testimonies of Study under the revised scheme. Subject III. for the present year is as follows:—

(*a*) A Detached Ballroom to a Large Country House, to be connected with the house by a covered way. The decorations should be specially considered. Shaded drawings to ½-in. scale, showing both interior and exterior, and a detail of decorations.

(*b*) A Landing-Stage to a River or Lake, with a Restaurant. Drawings to show complete construction ¼-in. scale and ½-in.

The dates for submission of designs are:—United Kingdom, June 30; Johannesburg, August 31; Melbourne, September 30; Sydney, September 30; Toronto, July 31.

Royal Scottish Museum Building Extension.

The report for the year 1911-12 by Sir T. Carlaw Martin, LL.D., F.R.S.E., on the Royal Scottish Museum, has been issued. The report states that a necessary first step in the scheme of an enlarged museum is in progress, and it is hoped that another year may see the beginning of a series of halls that are designed to relieve the overcrowding of specimens in the department of natural history.

Lower Thames Valley District Surveyors' Association.

This Association will hold its annual dinner on Saturday, May 4, at the Chiswick Town Hall. Visits of inspection will be made previous to the dinner to (1) Isolation Hospital, Willesden; (2) Metropolitan Electric Supply Company's power station at Willesden; (3) Brentford Gas Company's works at Brentford

Stratford-on-Avon.

Nash's House, now the New-place Museum, has been restored for the trustees of the birthplace, under the directions and superintendence of Mr. G. Pemberton, Mr. Guy Dawber acting as advisory architect for the work.

Royal Society of Medicine: New Buildings.

The new quarters of the Society will be opened by the King and Queen on May 21. They stand in Wimpole-street (south end), and have been erected after the plans and designs of Mr. John Belcher, R.A., and Mr. J. J. Joass, with an elevation in the Classical style.

Fine Art Exhibition, Venice.

The tenth International Exhibition of Fine Arts was opened a few days ago in the English pavilion. The Earl of Plymouth is Chairman of the British Committee, and the Executive Committee consists of Professor Gerald E. Moira for oil paintings, Sir Ernest Waterlow for water-colours, and Mr. F. Derwent Wood for sculpture. About 150 English artists contribute pictures and sculpture.

Art Works for Italy.

The statue, "L'Homme qui Marche," by M. Rodin, is placed in position in the Farnese Palace, which the French Government have recently acquired as their Embassy in Rome. Amongst the pictures and drawings by Mr. Walter Crane, now shown in the Leicester Galleries, is the artist's portrait in oils of himself, which the Italian Government invited him to paint for the Uffizi Gallery, Florence.

Manchester University.

We regret to announce that Professor Stewart H. Capper, M.A. (Edin.), whilst recovering from illness is ordered to take prolonged rest and, under medical advice, has resigned the Chair of Architecture in the Victoria University, to which he, being then Professor of Architecture in McGill University, Montreal, was appointed as first occupant in 1903.

Fire at Clumber House.

Clumber House, one of the notable buildings in the "Dukeries," was the scene of a fire at the end of April. The original house was built for the Duke of Newcastle about 1752, by Stephen Wright, the architect of the University Library, Cambridge. In 1879 much damage was done by a fire at Clumber, but the recent outbreak was not so serious, motor fire-engines being rapidly available.

New Bridges, Glasgow.

The Glasgow Corporation have resolved to construct two new bridges across the River Kelvin, in the western limits of the city; the one bridge between Maryhill and the Botanical Gardens, and the other, which will cost about 12,000*l.*, to join Radnor-street to Kelvingrove Park.

Economic Water Supply.

We have received from Messrs. Longmans, Green, & Co., Paternoster-row, E.C., a copy of the scale to Housden's "Economic Water Supply." This is now issued separately, price 6d. net, and also gratis with copies of the book. The scale is used for ascertaining the diameters of pipes and half-pipes adopting any desired coefficient. It is based on the tables in "The Precise Calculation of Pipe and Drain Dimensions" (Housden), Messrs. Longmans, Green, & Co., and is mainly intended for use therewith, but can also be used independently.

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on the 25th ult., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Hon. Sir E. P. Thesiger, K.C.B., in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Belfield, St. Ann, Rochdale, 100*l.*; and West Fordington, St. Mary, Dorset, 150*l.*; rebuilding the churches at Eastrop, St. Mary, near Basingstoke, 40*l.*; and Thorpe-on-the-Hill, St. Michael and All Angels, near Lincoln, 60*l.*; and towards enlarging the churches at Gillingham, St. Barnabas, Kent, 20*l.*; Gringley-on-the-Hill, St. Peter and St. Paul, Notts, 50*l.*; Morton, Holy Cross, Derbyshire, 20*l.*; and Mottingham, St. Andrew, Kent, 50*l.* A grant of 50*l.* was also made from the special Mission Buildings Fund towards building a mission church at Upton Park, St. Michael, Essex. The following grants were also paid for works completed: Maindee, St. John, Newport, Mon., 100*l.*; Medbourne, St. Giles, Leicester, 20*l.*; Penrhiwceibr, St. Winifred, Glam., 30*l.*; and Westhorpe, St. Margaret, Suffolk, 15*l.* In addition to this the sum of 250*l.* was paid towards the repairs of various churches from trust funds held by the Society. The annual general Court will be held at 3 p.m. in the Church House, Westminster, on May 23, the Bishop of Chester presiding. He will be supported by the Bishops of Manchester and Rochester, Mr. Athelstan Riley, and Mr. Walter Tapper, F.R.I.B.A.

Windsor.

Mr. A. Y. Nutt, M.V.O., Resident Architect to Windsor Castle, will shortly retire after nearly forty-five years' service, in the course of which he has also occupied the offices of Draughtsman, Clerk of the Works, and Surveyor to the Dean and Chapter. The Windsor memorial to King Edward, unveiled on Monday last, consists of a bronze statue of the late Sovereign with allegorical figures in bronze holding shields inscribed with the names: Intuitus (Tact), Sapientia (Wisdom), Humanitas (Humanity), and Felicitas (Geniality) at the four corners of the pedestal. The composition is the work of Countess Feodora Gleichen, whose designs were chosen from those of twenty competitors.

Book Sales.

Messrs. Sotheby have recently sold in their rooms, Wouvermans, Œuvres, 1737–80—30*l.*; Graves and Cronin, History of Sir J. Reynolds's Works, 4 vols. only, 1899—47*l.*; a collection of sixty views of Buildings in Paris, after Durand, etc.—33*l.*; Description de l'Égypte, 21 vols., 1809–13—29*l.*; and Ackermann's Histories of the Universities and Public Schools, 5 vols., 1814–16—43*l.* On April 20 Messrs. Christie sold Kennedy's etched Work of J. M. Whistler, New York, 1910, for 52*l.*, and Smith's British Mezzotint Portraits, 5 vols., for 17*l.* 10*s.*

Houses of Parliament (Oak Panelling).

Mr. Noel Buxton asked the Hon. Member for St. George's-in-the-East, as representing the First Commissioner of Works, whether the work of removing the varnish from the oak panelling in the Houses of Parliament was proceeding; and whether the Debating Chamber of the House of Commons can be dealt with during the summer recess.—Mr. Wedgwood Benn replied that the work was being carried out from time to time, as funds and the convenience of Members permit. The First Commissioner regrets that it will not be possible to remove the varnish in the Debating Chamber this year.

Architectural Assistants.

In Wednesday's Parliamentary papers Mr. Snowden asked the Hon. Member of St. George's-in-theEast, as representing the First Commissioner of Works, if any decision had been arrived at in regard to placing the class known as "Architectural Assistants" engaged in the Office of Works upon the established list; whether the undertaking given on December 7 last, that the wishes of all the men in this class in regard to their desire to be established would be ascertained, had been carried out, and, if any scheme had been prepared, would he say what was the nature of the proposals made?—Mr. Wedgwood Benn replied that a scheme had been submitted to the Lords Commissioners of his Majesty's Treasury, which provides for the establishment of a staff of permanent architectural draughtsmen and technical assistants to the architects.

Property Sales.

Amongst the properties just placed in the market are Moor Park, Farnham, in West Surrey, which embraces 500 acres upon the southern slopes of the Hog's Back, and the beautiful old gardens and pleasure grounds are traversed by the River Wey. It was at Moor Park that Swift entered the service of Sir William Temple, and met Hester Johnson (whom he celebrates as "Stella"), the daughter of Sir William Temple's steward. Not far distant are the remains of the Cistercian Abbey of Waverley, founded in 1128 by Giffard, Bishop of Winchester. Finedon Hall, near Wellingborough, Northants, has been for nearly three centuries the seat of the Dolben family. Consequently upon the death of Miss Mackworth Dolben, the estate, of some 1,600 acres, is to be sold, and Messrs. Knight, Frank, & Rutley are compiling a catalogue of the contents of the mansion, much of which has been in the house during many generations. The works of art and the furniture include an old English tapestry panel representing a hunting scene, a notable panel of Aubusson tapestry, family portraits, and XVIIth-XVIIIth century furniture. Bear Wood, Berks, formerly part of Windsor Forest, will be offered for sale in the course of the summer; the estate, of 3,000 acres, belonged to the late Mr. Walter, of the *Times*.

COMPETITION NEWS.

Regent's Quadrant Competition.

In accordance with our promise, we give below the questions and answers in reference to the Regent's Quadrant Competition instituted by the proprietors of the *Builder*:—

1. Is the hotel façade to be included on the drawings?

It would be desirable to show one bay.

2. Has any notice to be taken of intermedi
streets?

The accompanying plan shows street openi
to be provided for. The treatment of this openi
is left to the discretion of competitors.

3. On opposite side of street there are t
new buildings—one at corner of Oxfo
circus and another midway. They
similar. Does that mean that the whole of th
side will ultimately be of that design?

These buildings need not be considered.

4. Are competitors to adhere to Mr. Norm
Shaw's floor levels?

No, not necessarily.

5. Is a detail of the elevation to be given
No.

6. Are the rooms over shops all devoted
shop purposes? If not, separate entrances w
of course, be necessary?

It need not be assumed that the upper flo
will be let with the shops, and competitors
at liberty to show such separate entrances
they consider desirable.

7. Is the frontage for each shop to be
same as Mr. Shaw's?

No; absolute freedom may be taken in reg
to shop frontages.

8. Does façade include the street at side
hotel?

Yes; see reply to Question 2.

9. Are the ceiling heights as shown on rep
duction to be regarded as fixed?

No; see reply to Question 4.

10. Is the design to be shown connected
the Piccadilly Hotel, or separated from
hotel by Air-street?

Left to the discretion of competitors.

11. Could competitors have a diagr
showing exact finish as existing?

The present building may be assumed
terminate about 6 ft. within the left-hand e
of portion shown in illustration accompany
conditions (issue of April 19).

12. Does the 220 ft. of frontage include fi
the side of hotel entrance feature to the cou
of Piccadilly-circus, or does it include the
bay beyond entrance (which bay is, from mem
already built)?

The present building extends to Air-str
The 220 ft. includes this street and the front
as far as the Circus.

13. Can the existing setting-out of bays
taken as the suitable size for shops required

No; more freedom is desirable in this resp
See answer to Question 7.

14. Presumably for the purposes of this c
petition the slight curve on the Quadrant
be ignored. If not, can the curve be given

The elevation may be drawn as develope

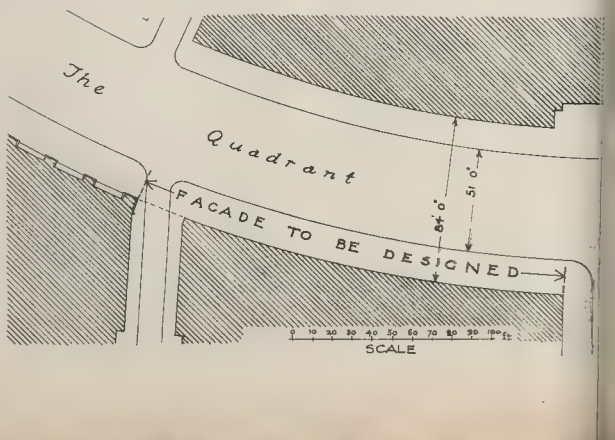
15. Are the building stories above grd
floor

(*a*) To be designed to form extension
Piccadilly Hotel, or

(*b*) To be designed exclusively for the s
floor tenants?

Not necessarily either. The façade shoul
appropriate to premises occupied for bus
purposes. See answer to Question 6.

16. What should be the cost of prop
façade?



This need not be considered.

17. Is it proposed to refront *only*, or ent
rebuild, adjoining building to Piccadilly Hc

To rebuild.

18. Will the successful design be erec

This competition must be regarded as s
for the premiums offered by the *Builder*.

Parliament Buildings, Winnipeg.

The competition promoted by the Government of Manitoba has been narrowed to five architects, the assessor in the preliminary competition being Mr. Leonard Stokes, R.R.I.B.A. Each of the five competitors will receive a sum of two thousand dollars to complete their designs.

British subjects practising in the British Empire were alone eligible to compete. The cost of the building was estimated at 400,000*l.*

Mr. Leonard Stokes has named the following five architects to proceed further:—

Mr. F. W. Simon, F.R.I.B.A. (Liverpool).
Messrs. E. & W. S. Maxwell (Montreal).
Messrs. Sharp & Murray (Toronto).
Messrs. Brown & Vallance (Montreal).
Messrs. Clemsha & Portnall (Regina, Sask.)

In handing his report to the Minister of Public Works Mr. Stokes testified to the general excellence of the designs sent in.

Church at Carrington, Notts.

Mr. Edward S. Prior, F.S.A., F.R.I.B.A., has now given his award in this competition. The first place has been adjudged to Mr. W. Curtis Green, F.R.I.B.A., 14, Gray's Inn-square, London. The designs of the following competitors were specially commended:—Mr. C. Pascoyne (Westminster), Mr. Macdonald Gill (Lincoln's Inn), Mr. G. C. Horsley, F.R.I.B.A. (Gray's Inn-square), Mr. Charles Spooner, F.R.I.B.A. (Lincoln's Inn). The competing designs are to be exhibited at Carrington, and also by the Nottingham Architectural Society.

Federal Capital City, Australia.

The following telegram from Sydney appeared in the *Times* of April 16:—"The designs for the Federal Capital have been reduced to a dozen, most of them the work of Americans, Frenchmen, or Germans. The British designs have only a small chance."

This announcement was felt to be disparaging to the work of architects in this country. It is well, therefore, that the Royal Institute of British Architects have seen fit to recapitulate the circumstances. "When the conditions of the competition were published by the Minister of Public Works the Australian Institutes of Architects at once protested against their unfair and unsatisfactory nature. There was no proper provision made for the appointment of qualified assessors, and the Australian Institutes warned the Minister that unless the conditions were amended their members would refuse to take part in the competition. The Minister refused to adopt the suggestions of the representative architectural bodies, and they accordingly vetoed the competition. They then appealed for support to the Royal Institute of British Architects, with which they are affiliated societies. The Royal Institute, which entirely agreed with the attitude of the Australian Institutes, endeavoured both by correspondence with the Minister and by deputation to the Acting High Commissioner in London, to induce the Australian Government to put the competition on a fair and proper basis. The Minister again refused to alter the conditions in any way, and the Royal Institute supported the action of its affiliated societies in Australia by issuing a letter to its members against the competition and by informing the American Institute of Architects and the principal architectural bodies on the Continent of the action which it had taken in the matter. There is reason to believe that the great majority of the architects of the Empire have loyally supported the decision of their representative bodies and have not entered for this competition."

This explains the alleged "small chance" of British competitors. We can only repeat the suggestion made in our issue of April 12, that, having made the awards, the Commonwealth would be wiser to start afresh as a lesser evil than the adoption for all time of a scheme which may be inadequate and unsuitable.

Sir G. H. Reid, the High Commissioner for Australia, has written to support the selection of assessors, but, while we have nothing to say against the local status of the gentlemen nominated—Mr. Kirkpatrick, indeed, is an enthusiastic and an able architect—we cannot agree that for an event of such world-wide interest their qualifications are outstanding. We hear that there are over 200 designs submitted.

Mural Decorations.

In addition to the competition for embellishing the vestibule to Middlesex Hospital, referred to in our last issue (p. 483), other awards will be made in connexion with the forthcoming exhibition at Crosby Hall, Chelsea. A space is vacant in the Church of St. Jude-on-the-Hill, Hampstead Garden Suburb (architect, Mr. E. L. Lutyens, F.R.I.B.A.), and a sum of 50*l.* is available towards the remuneration of the artist chosen. Other decorative designs required are for spaces in Messrs. Crosse & Blackwell's factory, in a village hall at Shrivenham, in a village school at Winchelsea, in the projected new building for the Gallery of Modern Art at Dublin, and in Sutton Valence School, near Maidstone. A prize of 10*l.* will be given for the design showing the best disposition of schoolroom equipment. All designs must be ready by May 21. Particulars may be obtained from Crosby Hall, Cheyne Walk, S.W.

Municipal Buildings, Padiham.

The Manchester Society of Architects have issued a notice stating that the conditions of this competition are unsatisfactory and that directly or indirectly no designs should be submitted by members.

Hale Town-Planning Competition.

Another notice issued by the Manchester Society of Architects is to the effect that the Hale Urban District Council decline to make any alterations in the conditions of this competition. "Each competitor has to purchase ordnance sheets for the district at a cost of about 25s., and, as these were last revised in 1908, he will have to go over the whole district and embody the numerous buildings since erected. The competitors are also asked to estimate the total amount of their charges should they be successful. As the duties are to a very large extent at present unknown, this becomes an almost impossible task. There is no guarantee that any qualified assessor will be appointed, either to adjudicate on the plans or to advise the Council. The Competitions Committee approached the Hale Council before the conditions were issued, and as soon as the conditions appeared they pointed out to them the unfairness of the points mentioned above. The Council find that these conditions are unsatisfactory, therefore members of this Society must not submit, either directly or indirectly, any designs in the competition."

BOOKS.

Notes on the Art of Rembrandt. By C. J. Holmes, M.A. With Forty-five Plates. (London: Chatto & Windus. 1911.)

As the Preface opens: "These notes deal almost entirely with the problem of art education, and may thus be regarded as a supplement (though their nucleus is of earlier date) to 'Notes on the Science of Picture-Making,'" by the same author. The nine chapters are based on lectures delivered at Oxford some years ago, and are to be regarded as a crious addition, not so much to opinion on "art education," perhaps, as to the mass of appreciation and data on the art of Rembrandt, as the title, in some opposition to the Preface, implies. The two subjects are found to commingle easily in this instance, however, although with a heavy quantitative balance of Rembrandt, for, whereas all there is to be said of "art education" (what a phrase!) can be said simply and shortly, and even "brusquely," taken or left, and so done with, to what may be said and argued about Rembrandt there is apparently no end. Of art education one may assent, tersely, that it cannot exist. A certain amount of technique may be taught—data, that is to say, may be supplied, or, translating the matter into architectural terms, a knowledge of the Orders may be instilled, bricks may be provided—but the rest, and here rudimentary art begins, must be learnt, and by the aspirant unaided, or, if he have stuff in him, unhindered. Principles, even, of composition and so forth (what else essentially are the Orders?) may be deduced and applied—as in picture-making in Japan, with its *yo* and *in*, etc.—but it will all amount to nothing if the basic rhythms, of which all principles are but imperfect verbal expressions, are not in the bones of the artist, and not the material with which his personality plays. The author embellishes this theme in a chapter called "The Limits of Self-Training" (more properly, "of what may be taught"), with instances and definite suggestions as regards art (*i.e.*, picture-making), which, in conjunction with Mr. Ashbee's recent "Should We Stop Teaching Art?" indicate the incidence, long overdue, of an authoritative, as distinct from a rebellious and scornful, reaction against South Kensington and the academies. By "authoritative" we wish to indicate those who are concerned with the problem rather than with themselves. It is the attitude of the teacher doubting, or, at any rate, officially realising, the limitations of his function. Artists, in varying degrees, have done so since the time of the subject of this book, for Rembrandt appears to be the first artist of note to proclaim by his conduct the modern conception of the imperative individuality of the artist, by breaking away from the practice of his time instead of transcending it in the due line of its development. Having bested his contemporaries, impelled from within, he drew himself aside, following his gleam, a glum and middle-aged rebel, into a realm of his own and into a cloud of obloquy. Mr. Holmes traces his development in terms of his etchings, of which there are many reproductions. We cannot expect enthusiasts to agree with any demur we may make to some of his appreciative estimates, for, on the whole, as admiration of Rembrandt etching goes, they are moderate and well balanced, while in later chapters comparing Rembrandt with Van Dyck and Titian, temperamental devotees of his subject will find matter to combat. A really fine appreciation of Van Dyck goes sadly contrary to the prevailing opinion of the day, and some passages in his well-considered analysis of Titian and the colourists will be accounted heresy by those who hold our somewhat smudgy-faced Dutchman divine. For in this, the last chapter of the book, distinctions are made clear and comparisons formulated which are undeniably true, and dismiss some of the claims which contemporary enthusiasm is apt to make. Rembrandt is seen to be not a maker of beauty, not a painter of delight. To quote the author: "He depends on other arguments, on profound insight into character, and on concentration of effect, and so appeals to our sympathies and intellect rather than to our æsthetic sense pure and simple." And again: "It may be argued that an appeal to the intellect (and it is through the intellect that we have to appreciate such an art as Rembrandt's, even when it calls most directly upon our common human sympathies) is intrinsically nobler than an appeal to the eye, such as that made by a piece of fine decorative colour. Such an argument, however, could, I think, be pressed only by one who was not an artist."

All Saints' Church, Horseheath. By Catherine E. Parsons. (Cambridge University Press. 1911. Pp. 101. 5s. net.)

This little volume, which is dedicated to the parishioners of All Saints' Church, Horseheath, in the Deanery of Camps, Cambridgeshire, contains a detailed account of the church, its monuments, furniture, etc., with five photographic plates and a plan.

The church appears to have been practically rebuilt in the XIVth century on the site of a Norman church, of which certain fragments of masonry, with the Norman zigzag pattern, built into the walls of the present church, are the sole remains.

The structure seems to have suffered the usual indignities, not only during the XVth and XVIth centuries, but also at the hands of the modern restorer, and in this connexion it is noteworthy that the author attributes the loss of the painted glass to the XIXth-century restorer rather than to any destruction wrought in more stormy periods, since there is evidence that there was painted glass in the Perpendicular windows in the nave as late as 1742.

The principal objects of interest from the antiquarian point of view appear to be the XVth-century octagonal font and a monument to Sir Giles Alington (1586). There are also some fine brasses.

Hints to Young Valuers: A Practical Treatise on the Valuation of Property. By ANTHONY CRAGG, F.G.S. With explanations of the legal principles involved by JAMES ROBERT VERNAM MARCHANT, M.A., Barrister-at-Law. Fourth Edition. (London: The *Land Agents' Record*, Ltd. 1912. Pp. 1104. 25s.)

A WORK which has passed to its fourth edition in less than fifteen years requires but little recommendation in the hands of the reviewer. The first edition of this book appeared in October, 1897, to be followed by a second edition in 1901, and we can see no reason why this fourth edition should prove less successful than its predecessors.

In the second edition the authors observed that some exception had been taken to its title, as inadequately indicating the character and scope of the work. Its origin was some articles in the *Land Agents' Record*, intended as hints to young valuers, but, as is now probably well known, this volume contains a compendium of information which should be useful not only to young valuers and surveyors, but to many others connected with the ownership or management of estates.

In this last edition the authors state that the most important changes have been those rendered necessary by recent legislation, such as the Agricultural Holdings Act, 1898, the Small Holdings and Allotments Act of the same year, the Finance Act, 1909-10, and the Licensing (Consolidation) Act, 1910. As regards those portions of the Finance Act which introduced the new taxes on land, text-book writers are at present only in a position to furnish a fairly lucid statement of the apparent effect of the sections, and the authors of this work have attempted nothing further. As we recently pointed out, one of the disadvantages attending modern legislation of this character (which institutes officials not only as the Court of First Instance, but also as the first appellate tribunal, and whose decisions are given no publicity) is that the Acts remain without judicial interpretation, and consequently both writers and the public are left, so to speak, in the dark. Very few persons have the means or the persistence to appeal from the referees under the Finance Act to the courts, and thus very few authoritative decisions have been given under the Act. Many of the chapters in this volume appear to have little connexion with the subject of valuation; we may instance those on Building Contracts, the Relations of Landlord and Tenant, and the Powers of Sanitary Authorities, but it may be intended to serve also as a land agent's handbook. These chapters are not a new feature of this edition, but we may point out that there is one disadvantage which may attend on widening too much the scope of one volume, and that is that the value of that part of the work which is dealt with thoroughly may be obscured by that part in which only an elementary sketch of the subjects touched upon can necessarily be given. The work seems to have been carefully revised, and its clearness of style is retained, and, as we have said, this edition should command the success attained by former editions.

CORRESPONDENCE.

The Decadence of English Architecture.

SIR,—When the work of designing such important buildings as the Ritz Hotel, the *Morning Post* Offices, and the Automobile Club is entrusted to foreign architects it is evident that there is something radically wrong with the architectural profession in England. In the cases we have quoted it can scarcely be urged that the buildings are of such a special nature as to require the services of foreign architects in preference to those which one might reasonably expect could be equally well rendered by our fellow-countrymen.

Why, then, have the owners of these buildings thought it advisable to go so far afield for the professional assistance they required? We are afraid the answer must be that the owners have had sufficient discrimination to see that they are likely to obtain a better result by the employment of the foreigner. In other words, it is impossible to obtain the services of English architects who have been equally well trained in the technique of their art. The dearth of highly-qualified men in this country is due to our present unsystematic and inefficient mode of architectural training. And so long as we remain without properly-organised and properly-administered schools of architecture we may anticipate that the work of the better-trained foreign architect will be more and more in evidence in the United Kingdom.

Recognising this fact, it is imperative that the architectural profession should seriously consider what steps can be taken to cope with the difficulty.

It seems to us that following the formulation of a sound and comprehensive scheme of architectural education the Government should be approached to give its financial support to enable the scheme thus put forward to be realised in its entirety.

We are aware that the British Government rarely, if ever, does anything in the cause of art; but in this particular case it might be induced to see what foreign countries have long ago realised, viz., the undoubted fact that good architecture is a national asset, and as such State assistance to art education has proved a sound financial investment.

But however good such a scheme may be in theory, and however well endowed, all would go for nothing unless the direction of the students' work were under the absolute control of specially-trained men. Handicapped as they have been in the past by the non-existence of any school for the advanced study of their art, the architects of this country cannot be expected to furnish the necessary teachers.

It would seem, therefore, that upon its inauguration a National School of Fine Art would have to rely upon obtaining Professors from foreign countries.

To those who do not know the details of the system of architectural training which has been carried on so long and successfully in France the following brief description of the curriculum of study at the Beaux-Arts may be of interest:—

After a competitive entrance examination for admission the student in architecture attends a course of lectures on each of the following subjects:—

Mathematics, Descriptive Geometry, Stereotomy, Physics, Chemistry and Geology, Construction, Perspective, Building Regulations, History and Theory of Architecture.

In addition to the foregoing subjects, which are specially applicable to the training of architects, it has been wisely felt that, as architecture is but one branch of art, it is necessary that its exponents should receive at least some instruction in the sister arts of Painting and Sculpture.

As the architectural student receives his specialised instruction, so in like manner do the painters and sculptors become specialists in their separate arts. But prior to this specialised training all students of the Ecole des Beaux-Arts, whether painters, sculptors, or architects, are obliged to attend a course of study on Design, Modelling, Elementary Architecture, Literature, and Decorative Design.

By adopting this method of training painters, sculptors, and architects are taught at an early age to appreciate the merits and necessary limitations of their colleagues' work. The exponents of the three arts thus become accustomed to work together, and it is only by this appropriate application of their united efforts that an homogeneous and thoroughly satisfactory artistic result can be obtained.

To compare the results obtained under this methodical training with those that follow the haphazard system (or want of system) in vogue in this country is not only humiliating and depressing, but shows that our much-vaunted commercial instinct in this instance is disastrously astray.

This is only one aspect of the many problems relative to the welfare of the architectural profession which show the urgent necessity of obtaining statutory powers to enforce a satisfactory system of architectural education.

So long as we are content to see untrained men allowed to practise in this country, just as long will the decadent period of architecture now existent be apparent.

GEORGE HUBBARD.

about 4,000*l.* The foundation-stone of t
building was laid last week.

EDITORIAL SUMMARY.

The leading article deals with the Royal Academy Exhibition.

"The Protection of Ancient Monuments" is the title of a second article, dealing with the Bill now before Parliament (p. 506).

In "Notes" Column (p. 507) will be found observations on: "The Campanile, Venice"; "The Institute and the Society"; "The Competition for the Australian Capital"; "Egyptian Excavations."

A notice of the Exhibition of the Royal Society of Painters appears on p. 507.

The Annual Dinner of the Society of Architects was held on Friday last week at the Holborn Restaurant. A report appears on p. 508.

A meeting of the Surveyors' Institution was held on Monday, when a paper was read, entitled "Some Principles in the Valuation of Land and Buildings" (p. 510).

Replies to questions in relation to the Regent's Quadrant Competition instituted by the Proprietors of the *Builder* appear on p. 512.

Book Reviews (p. 513) include: "Notes on the Art of Rembrandt"; "All Saints' Church, Horseheath"; "Hints to Young Valuers."

In Correspondence columns (p. 514) will be found letters on: "The Decadence of English Architecture"; "The R.I.B.A. Elections."

The Monthly Illustrated Civic Review (p. 517) contains: "The Future Development of Ottawa"; "The Town-Planning Conference"; "A Scottish Judge and an Architect's Centenary"; and Notes.

The Building Trade Section (p. 523) contains: Recovery of Contract Price without the Architect's Certificate"; "Applications under the London Building Acts"; "Projected New Buildings in the Provinces," etc.

In Legal Column (p. 526) will be found notes on: "Trade Union Law"; "Workmen's Compensation"; "Rebuilding Mansion House Settled Estate."

Law Reports (p. 527) include brief reports of the following cases: "Sandon *v.* Mallaby-Deeley"—the decoration of a mansion; London County Council *v.* Jones"—when is a building dangerous?; "The Sun Assurance Company, Ltd. *v.* C. Bushby & Sons"—Account of wages under Workmen's Compensation Act Policies.

MEETINGS.

FRIDAY, MAY 3.

The Institution of Mechanical Engineers.—Discussion will be resumed by Professor J. O. Arnold on the Tenth Report to the Alloys Research Committee: On the Alloys of Aluminium and Zinc." 8 p.m.

SATURDAY, MAY 4.

The Royal Institution.—Professor Reginald Blomfield, R.A., M.A., F.S.A., on "The Architecture of the Renaissance in France, 1494-1661." III.—"1594-1661. Architecture and France." 3 p.m.

Edinburgh Architectural Association.—Visit to Glasgow: (1) The Cathedral; (2) Mitchell Library.

The Institution of Municipal and County Engineers.—South Western District meeting, to be held at the Public Hall, Exmouth.

Lower Thames Valley District Surveyors' Association.—Visits of inspection and dinner. Members will assemble outside Turnham Green station (Bedford Park) at 2.30 p.m.

MONDAY, MAY 6.

The Royal Institute of British Architects.—Annual general meeting. 8 p.m.

The Society of Engineers.—Mr. W. Yorath Lewis on "The Effect of Intermittency in Limiting Electric Traction for City and Suburban Passenger Transport." 7.30 p.m.

Royal Society of Arts (Howard Lecture).—Capt. H. R. Sankey, R.E., on "Heavy Oil Engines"—II. 8 p.m.

TUESDAY, MAY 7.

The Society for the Promotion of Hellenic Studies.—The third general meeting, in the Rooms of the Society of Antiquaries, at Burlington House, Piccadilly, W. Professor Sir W. M. Ramsay, D.D., will read a paper on "The Shrine of the God Men Askaenos at Pisidian Antioch." 5 p.m.

WEDNESDAY, MAY 8.

The Institution of Municipal Engineers (Southern District).—Mr. Sidney Palmer on "The Design and Planning of Working-Class Dwellings." 7 p.m.

THURSDAY, MAY 9.

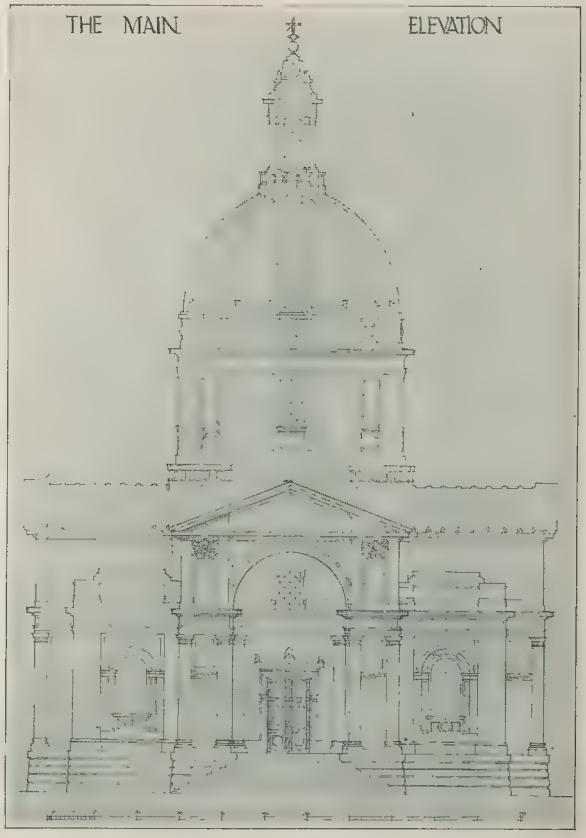
The Society of Architects.—Professor W. A. Scott, A.R.I.B.A., A.R.H.A., on "Grecian Architecture." Illustrated by lantern slides and drawings. 8 p.m.

Society of Antiquaries.—8.30 p.m.

Concrete Institute.—(1) Annual general meeting. 4.30 p.m. (2) Annual dinner. 8 p.m.

SATURDAY, MAY 11.

The Society of Engineers (Incorporated).—Annual dinner at the Criterion Restaurant, Piccadilly-circus, W. 6.30 for 7 p.m. Mr. John Kennedy, the President, will take the chair.



ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

The following are abstracts of two papers read at the ordinary meeting of the Institution on the 16th ult.:—

(1) "The Remodelling and Equipment of Madras Harbour," by Sir Francis J. E. Spring, K.C.I.E., M.Inst.C.E.

The author, who holds the position of Chairman and Chief Engineer to the Madras Port Trust, shows how, on a sandy coast totally devoid of all natural advantages, an artificial harbour with an area of 200 acres had been constructed, originally at a cost of nearly one million sterling; and yet when made, and up to seven years ago, it was found to be of comparatively little use for the easy, cheap, and expeditious transit of cargo between ships' holds and carriers' carts or railway waggons. By an expenditure of 350,000*l.* on the remodelling of the form of the harbour and the formation of a basin for small craft conditions have been secured which enable cargo to be handled between ship and shore in all weathers. This remodelling consisted in closing the east entrance, which allowed the swell to roll in nearly all the year round, and forming a new north-east entrance under shelter of a projecting breakwater. Finally, at an additional cost of 300,000*l.*, equipment has been provided in the shape of works on shore, such as piers and wharves for lighters, a quay for ships, an ample supply of cranes, a large area of shedding, together with railways, roads, and everything else required for the speedy, safe, and convenient passage of goods through the Port Trust's premises. The direct result of the construction of the boat-basin referred to has been to bring into existence a fine fleet of privately-owned lighters, of 40 tons to 60 tons capacity. The effect of this extra two-thirds of a million expenditure over and above the original million is that vessels visiting the port—other than what may be called the passenger ferry-boats trading with Burma and the Malay States—are passing in and out of the harbour in about half the time possible five years ago; whereby its capacity has virtually been considerably enlarged. After a brief summary of the history leading up to recent developments, the author deals with the matters of engineering interest met with in connexion first with the remodelling of the harbour and next with its equipment. He also touches on the important question of sand-movement. The question of wind-action is distinguished from wave-action as a factor affecting the over-side working of vessels moored in the harbour, and it is claimed to have been proved that, as the result of the remodelling, it will be safe to build quays at which large vessels may lie and work their cargo. As such quays seem to be also needed in the harbour, a scheme has been prepared for a length of 3,000 ft. of masonry ship-quay, of which about one-fourth is now well in hand. The rates at which important parts

Design for a Royal Memorial Chapel.
By Mr. G. H. Fogg itt.

of the work have been executed are given, together with an explanation of how funds were provided. The average incidence of the dues levied by the Port Trust is stated, whether on goods per ton or on vessels per ton registered—dues which it has not so far been found necessary to enhance, as the result of the heavy expenditure that has lately been incurred. Finally, the manner and conditions of handling cargo are described, and the extent of the Trust's intervention between steamers and their customers, together with the reasons for such intervention, is dealt with.

(2) "The Alteration of the Form of Madras Harbour," by Mr. H. H. G. Mitchell, M.Inst.C.E. This paper deals with the method of carrying out the actual work of alterations to the harbour. The first consideration was the weather, and special precautions had to be taken to secure the work during the cyclonic season. By taking such precautions it was possible to proceed continuously with the setting of the sloping blockwork. The materials used in and the method of making the concrete blocks are described. In the erection of the north sheltering arm the blocks were dealt with by means of a titan crane capable of lifting the 33-ton blocks at a radius of 62 ft. The blockwork is in the form of sloping slices on a rubble bed, with pell-mell wave-breaker blocks on the seaward side. The opening of the new entrance presented great difficulties, as not only had the existing breakwater to be removed, but also the remains of a former breakwater. By means of the titan crane and a floating barge fitted with a powerful derrick, however, both the pell-mell blocks and the sloping blocks were effectively removed. The rubble base was dredged by means of a bucket dredger, precautions being taken to strengthen the valves, shoots, and hoppers against the pounding of the large stones brought up. On the opening of the new entrance the old one had to be closed. This was satisfactorily completed in September, 1910. The author also describes the construction of the slipway which was made capable of taking vessels up to 500 tons dead weight. Finally, the system of accounts used, and the method of payment of labour are dealt with, and details of the cost of the work are given in an Appendix.

At the ordinary meeting on April 23 the following elections of new members and Associate members and students were reported:—As elected members, G. L. Andrews, B.Sc. (Lond.); G. T. Bradley, Rakwana, Ratnapura, Ceylon; C. Ross Duggan, Calcutta; E. J. Elford, Southend-on-Sea; H. E. Footner, Wealdstone; J. Heron, B.E., Downpatrick, Co. Down; and S. F. Smith, London. Seventeen Associate members were elected.

ILLUSTRATIONS.

Design for the Façade of a Palace.

THIS work, by Mr. S. Clough, was shown at the Royal College of Art last year. A note on the general disposition of the buildings will be found at the side of the plans.

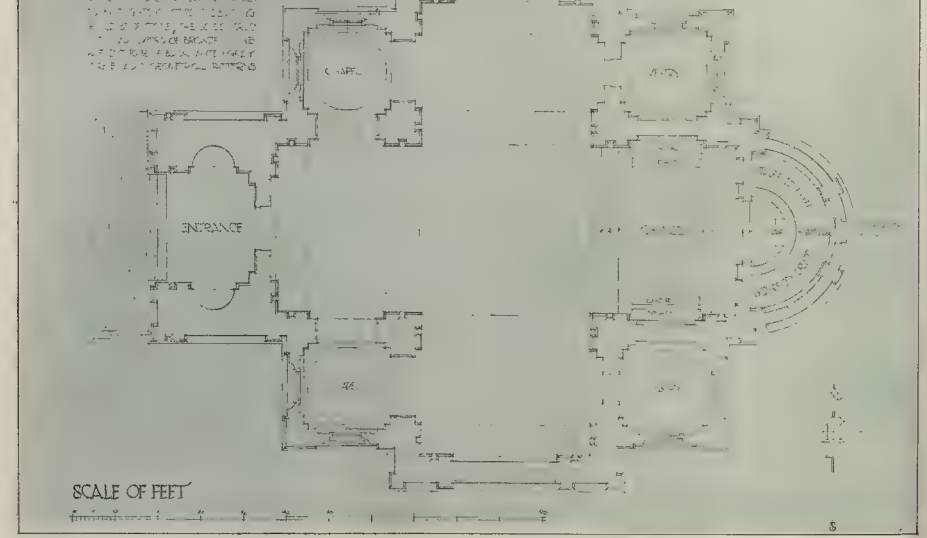
Designs for a Royal Memorial Chapel.

THIS design, shown also at the Royal College of Art, is intended primarily as a design for a scheme of colour for the interior of a chapel. It is, in a broad sense, based on a study of Greek architecture, with an attempt to procure the refinement of line, delicacy of ornament, and general impressiveness which are characteristic of this style.

Much of the smaller ornament was inspired by that on the Greek pottery, etc., in the British and Victoria and Albert Museums. The painted compositions are after Pintoricchio, being selected on account of their refined and delicate handling. The pendentives have painted on them the four Evangelists, whilst the compartments of the dome contain paintings of various saints. The lunettes around the chapel would contain representations of various scenes from the Scriptures and notable events in the reign of the Sovereign it is intended to commemorate. The materials proposed by Mr. S. Clough are Portland stone for the general facing and inner dome, the outer dome of steel being lead and copper covered. The interior decoration to be of white and coloured marbles, with paintings on the stone in some instances and in others on plaster.

Mr. G. H. Foggitt, R.I.B.A., Tite Prizeman, 1911, Travelling Scholar of the Royal College of Art, 1911 (School of Architecture), is the author of the design illustrated herewith. The subject, set primarily as an exercise in colour decoration, was "A Commemoration or Memorial Chapel. Based on the Italian Renaissance." The chapel was designed to crown an eminence, and to ris from a terrace, approached by flights steps. The plan is simple, on the lines the Greek cross, the angles between th arms being occupied by chapels and vestrie bringing the whole to the square. The alt is placed in a small apse, and at either sid of this apse are stairways leading down t the crypt.

Externally the church would be faced wit dressed stone up to the top of the drum the dome; the dome would be covered wit lead.



Internally the architectural features woul be left the natural colour of the stone, th intermediate spaces being coloured. Th barrel-vaults and dome are coffered, th coffers having red or blue backgrounds, wit ornament picked out in relief. Between th four windows in the drum are four lar figure compositions. The chapels would treated in keeping with the rest of th building.

FIFTY YEARS AGO.

MONTHLY REVIEW · *of* · CIVIC DESIGN.

Parliament Buildings from the River, Ottawa.

THE FUTURE DEVELOPMENT OF OTTAWA.

THE future development of Ottawa, the capital city of the Dominion of Canada, the seat of the Dominion islature and of the Supreme Courts, and residence of the Governor-General, is natter of more than local interest, for it cts the prestige of the Empire as a ple.

lthough Ottawa only became prominent 857, when it was chosen as the seat of ernment, the first settler arrived here 1800, settling at the Chaudière Falls, afterwards, it is said, selling his land he Ottawa side of the river for 200 dollars. he origin and growth of the present city probably due to the Rideau Canal, ch was constructed in 1827 to connect er Canada with Lake Ontario, and so ple vessels to pass from the ocean to the t lakes without being subject to inter- nce from the American side of the St. rence.

he Ottawa River being the natural high- to the forest districts of the north and , and water-power being obtainable the Chaudière and Rideau Falls within city limits, Ottawa has become the centre ne lumber trade, and of such subsidiary ufactures as matches and paper. Con- ring the enormous amount of water- er available — 1,000,000 horse-power in a radius of some 50 miles—the future its manufactures would seem to be red.

e natural formation of its site leads partition of the whole city area into e main divisions. The city proper is ted on the southern and higher bank ne Ottawa River in the angle formed by junction with its tributary, the Rideau, es which is a residential district including au Hall, the seat of the Governor-General. ne northern and lower bank of the Ottawa r is the manufacturing district of Hull. he city itself, crowning a high bluff looking the river, from which magnificent views may be obtained over miles of undulating country to the Laurentian Hills, stand the Parliament Buildings of the Dominion. They are grouped round three sides of a square, the fourth side of which is formed by the principal street of the city. In the centre are the Senate, House of Commons, and Library, and on either side the Departments of Finance, Public Works, Agriculture, etc. They were erected in 1860-65, and are built of a light-coloured sandstone with red sandstone dressings.

The chief interest in Ottawa, however, from the architectural point of view is not so much its past achievements as its future possibilities. The views we publish give some idea of the beauty of its situation and of the possibilities inherent in such a site if handled in a sufficiently comprehensive manner with due regard to the special circumstances of the case.

The Canadian Government has for some time past been alive to the necessity of preserving and improving its natural charm. As long ago as 1899 an Act was passed providing for an annual grant of 60,000 dollars to "The Ottawa Improvement Commission" for the acquisition of property

Central Block, Parliament Buildings, Ottawa.

The Canadian Life Building, Ottawa.
Mr. Allan Keefer, Architect.

for the purpose of public parks, driveways, etc., and other work connected with the improvement and amenity of the city.

This Commission proposed a series of driveways from Rockcliffe Park on the eastern end of the city to the Experimental Farm in the west, much of which has since been carried out. To its further efforts the city owes a bridge across the Rideau River, the National and Strathcona Parks, a beautiful driveway at Rockcliffe along the south bank of the Ottawa River, and various other improvements.

But however valuable these improvements may be, especially as preserving the river banks and other features of natural beauty, they seem for the most part to be merely piecemeal and isolated improvements which have no relation to any sufficiently comprehensive scheme.

For this reason the deputations to the Prime Minister, representing all the Societies of Canadian Architects, is especially to be welcomed. Recognising the necessity of immediate action the deputation pressed upon the Government the advisability of creating a Commission with town-plann powers, incorporating in it the pres Improvement Commission. We trust representations will meet with immedi success.

Although such a Commission must doubt consider the future of the city fr many and various points of view, the asp which naturally appeals most to us is t of its development as the capital city the Dominion. This seems to be the governing feature of the situation, the fac which differentiates it from all ot Canadian cities and provides the ruling i of the general lay-out.

This no doubt could be fully realised any properly constituted Commission t may be appointed, and it is to be hoped t the Canadian Government will see the nec sity of securing the advice and assista of the best architectural talent available

Canadians are perhaps too fond of ferring to Ottawa as the "Washing of the North," but if its future devel ment is left in the hands of those l qualified to advise there should be fear that any attempt would be m to copy Washington or to force upon extremely interesting and unusual site arbitrary forms which are not the log outcome of the necessities of the case inspired by the natural charm of the si tion. While not rivalling Quebec, perh in the scale and grandeur of its nat setting, Ottawa has a unique charm distinctive character of her own which all costs should be preserved. No cap city in Europe, with the possible excep of Budapest, has finer natural advant or more romantic possibilities, and it w be nothing short of a disaster if the r is not made of such a magnificent op tunity.

It is, we believe, rather the custom Canada to hold that the country is too in other directions, and is not yet enough to undertake great town-plan schemes, but that later on, with more le and more wealth, they could be dealt wit greater advantage. If, however, we ar judge from the experience of this cou Canada will never be better able to a them. Here such schemes are consid impossible because of the enormous val the land and vested interests conce and it is customary to lament the fact they were not carried out long ago land was cheaper and when, presum the country was poorer.

Be this as it may, the sojourn of the of Connaught at Ottawa, as the first Gove General of the Royal House, seems to su that no moment could be so appropria the present for the initiation of a fine prehensive scheme to render the city worthy of her high destiny.

We have every sympathy also with deputation in drawing attention to the s comings of the public buildings produc the Government Department of Public W We do not believe in departmental art or elsewhere. If in this country the that can be said for the best of such ductions is that they are indifferently the most that can be said for the best of produced in Canada is that they a differently bad. The worst are s deplorable. This is not the fault c officials, but of the system.

Although it might be possible to im the standard of work by thoroughly r nising the Department and offering s that would attract first-rate men, is not the slightest doubt that the sys inherently vicious and that the Gover would be well advised to make a sweep of it and give all public wo the most competent architects in Dominion.

Indeed, the existence of this Depar with its antiquated and inefficient m appears to be particularly unfortun view of the proposed development

View of the Ottawa River and Chaudière from the Parliament Buildings, Ottawa.

. If a Town-Planning Commission is to eed it needs a free hand and undis- d authority. The creation of such a mission would seem to be a good oppor- ty for closing the Department and con- ing the architectural affairs of the e by more efficient and up-to-date ods.

lthough many of the more recent build- in Ottawa designed by independent itects are of a high standard of excellence, ity is developing in the usual haphazard ner. The design by Mr. Allan Keefer itself a good example, refined and ing in detail, of a street architecture h boldly faces the problem involved satisfactorily solves it from the point ew of the individual owner. If, however, satisfactory scheme for the city is to be ed it is evident that some limitation heights must be mutually agreed upon h will enable such problems to be solved equal satisfaction from the point of of the city as a whole.

SCOTTISH JUDGE AND AN RCHITECT'S CENTENARY.

RD COCKBURN, whose name was given to the burn Association, Edinburgh, had at heart rue dignity of a city. "There are some," rote, "who hold a town to be a mere tion of houses, shops, and streets, and that ded there be enough of these duly arranged ilitarian principles all anxiety as to whether esult shall be a Bath or a Birmingham re folly and affectation." With such civic nents to guide him the celebrated Scottish was prepared to act forcibly when any alism was imminent in Edinburgh during rst half of the XIXth century.

en William Edgar, the architect, made his f the city in 1765 he was able to engrave le and two coats of arms in the place now ied by Princes-street and the New Town; ace between the Nor' Loch and the Firth rth was as innocent of buildings as it was Hollar etched the view of the city in the th century, the print of which is so rare. But vements were in contemplation, and Craig's is scheme for the New Town, published in began to take form in 1767. In Alexander rd's map, issued in 1784, the North e, Princes-street, George-street, and Queen- were *faits accomplis*, covering the ground n as Barefoot's Parks.

Craig's plan, inscribed "with the utmost humility" to George III., was introduced with a quotation from the poem "Liberty," written by the designer's uncle, James Thomson :—

> "August, around, what Public Works I see!
> Lo! Stately Streets. Lo! Squares that court the breeze."

The authorities were delighted with the idea, and made much of Craig, giving him the Freedom of the City and a medal.

The fact that the magistrates were led to offer a premium of 20*l.* to the first builder of a house in the new area suggests that the plan did not commend itself to everyone, and, indeed, after the work had progressed the effect was unsatisfactory to many citizens. Lord Cockburn, for instance, then in his youth, noted without enthusiasm the development of the city, "which gives us a taste for grand and melancholy solitude." In after years he wrote :—"We were led into the blunder of long, straight lines of streets divided to an inch, and all to the same number of inches by rectangular intersections, every house being an exact duplicate of its neighbour with a dexterous avoidance, as if from horror, of every ornament or excrescence by which the slightest break might vary the surface. What a site did Nature give us for our new town! Yet what insignificance in its plan! What poverty in all its details!"

In the first few years of the XIXth century, after the death of Craig, it occurred to someone to vary the geometrical lines. Abercromby-place was the result, and it is recorded that a popular pastime of the day was to visit the scene and stare at the street that was curved.

The formal characteristics of Craig's plan became modified in after years by the erection of buildings of architectural variety and interest in the place of the first houses, which were so alike and so unattractive.* Thus the objectionable features of the first scheme were gradually eliminated, and the citizens of Edinburgh rejoice that their ancestors in the XVIIIth century at the outset of their proceedings towards the development of the New Town obtained the architectural plan which secured the present spaciousness and convenience. It is regrettable that those responsible in after years for dealing with extensions of the city elsewhere did not profit by the experience gained in realising Craig's plan. The possibilities of systematic foresight should have been evident, yet, as Lord Cockburn, the strenuous advocate of architectural and municipal reform, failed to grasp the significance of the movement, it is not surprising that less enlightened citizens should have renounced the experiment.

* * * *

One who, had he lived, might have been reckoned among the greatest of architects died in 1813. William Stark was his name, and his work seems to have been overlooked. While he is mentioned in the "Architectural Dictionary" (under the name of Starke), he is ignored by the "Dictionary of National Biography." His title to fame would have been secure, doubtless, if he had possessed an outstanding vice, like the inconspicuous painter who earned distinction as a poisoner, and was transported to Van Dieman's Land, or like the second-rate stipple-engraver who was hanged at Tyburn for forgery, and whose deeds, consequently, are recorded in the annals of the country.

But William Stark, apparently, had no such claims to notice. A native of Dunfermline, he made a reputation in Glasgow by several buildings, including a lunatic asylum, planned with unusual skill. His only remaining monument in Glasgow is, we believe, St. George's Church, the spire of which has been compared to the best of Wren's. Through ill-health the young architect removed to Edinburgh, where his work seems to have been appreciated at once. Lord Cockburn notes that Stark was possessed of exceptionally good principles, "particularly in the composition of towns," and he was consulted by the magistrates of Edinburgh on the best way of laying-out the ground on the east side of Leith Walk. He urged that the planting of trees should be considered as part of the duty of the municipality. Sir Walter Scott, who, in 1811, had bought for about 4,000*l.* the farm of Abbotsford, asked him to design an ornamental cottage "in the style of the old English vicarage house," but before the project could be carried out Stark died. Scott, writing to his friend and counsellor, Daniel Terry, the London actor, said that with Stark "more genius has died than is left behind among the collected universality of Scottish architects." Does modern opinion endorse that tribute?

In the *Scots Magazine* of 1813 the following obituary notice appears :—"At Drumsheugh, near Edinburgh, William Stark, Esq., architect, whose many virtues and amiable disposition endeared him to his family and friends, and whose professional talents were acknowledged to be of the highest order. The noble buildings with which he has adorned Glasgow and other parts of the kingdom will bear lasting testimony to the originality of his genius, the solidity of

* Some illustrations of old Edinburgh were published with an article in the *Builder*, November 5, 1910.

his judgment, and the purity of his taste. His reputation, deservedly high in Scotland, was spreading so rapidly in England that his death may justly be considered a severe loss to the architecture of Britain."

Such evidence and more exists of the ambitions and accomplishments of William Stark. Allowing something for the exaggerations of contemporaries, there remains enough to show that his career, though short, was inspired, and our associates in North Britain, in making up their programmes for the next session, should ensure that the name of their predecessor of a hundred years ago, whose pupil was William Playfair, may be indelibly inscribed on the roll of fame of the nation. A centenary paper read next year before the Edinburgh Architectural Association or the Glasgow Institute of Architects would give prominence to the endeavour to reinstate William Stark in history. Perhaps Professor Geddes or Professor Gourlay could be induced to undertake the task.

TOWN-PLANNING CONFERENCE.

THE National Town-Planning Conference was held at the Westminster Palace Hotel, London, S.W., on April 24 and 25, Alderman W. Thompson (Richmond) being in the chair, and nearly 120 public authorities and societies interested in housing and town planning being represented. The object of the Conference was to obtain a clear idea and precise information as to the procedure to be followed by local authorities in town-planning work.

The Chairman said that the local authorities had to work the Act, although it was unquestionably desirable that the central authority should be strengthened and should do more to make their task easy. The duty of local authorities in administering the Town Planning Act was not to put a burden on the owners, because by so doing they were putting a burden on the occupiers. The essence of it was that they should get sunlight, fresh air, and vegetation around all the dwellings of the people. They must have ideal conditions, but they must take very great care they did not make it too ideal to enable the working man to pay the rent of the cottages which would be placed in the ideal surroundings. It was extremely important for local authorities to consider what they were going to give the owners of property in return for the restrictions put upon them. If they were not able to offer some cheapening in the cost of development, he thought there would be a reaction against attempts to give ideal conditions to the people. A Conference was held in Liverpool recently, when upwards of 600 representatives of local authorities were appointed to attend. The scheme was, he considered, progressing very favourably, as they already had a Bill in Parliament dealing with the matter, which had reached the Grand Committee stage. The best thing they could do now was to use their best endeavours in showing the difficulties Parliament would have to contend with in administering the Act. The ideal of town planning seemed to have been received almost universally very favourably. The scheme would undoubtedly cost money, and he thought it was a matter entirely of balance-sheets. They had not, however, to consider the question in the light of how much the proposed scheme would cost, but how much was lost by the present conditions, which in twenty years he estimated cost the people millions. It was nominally a question of balance-sheets between the owners of property and the local authorities.

Although some printed communications had been sent to the delegates, it was decided that the object of the Conference would be better served by those desirous of information asking questions.

Areas of Town-Planning Schemes.

The question was raised whether existing parks and recreation grounds should be included in town-planning schemes, and

Mr. Henry R. Aldridge, the Secretary of the Housing and Town Planning Council, said that an objection to the scheme raised at Sutton Coldfield was that the area to be taken in under the scheme was not large enough. In fact, the owners and others interested were anxious to be included under the scheme.

Mr. Lovelock (Carshalton Urban District Council) asked whether it was thought advisable to make their arrangements and plans known to everyone. He had had a certain amount of experience in the matter, and he thought it would be best to keep their arrangements as secret as possible.

Mr. Gunn (Malden and Coombe Urban District Council) said the question arose as to whether there were to be definite fixed areas under the town-planning schemes. In the case of Whitby he noticed they proposed to take in the whole of a district.

Mr. Aldridge said that when considering a district it was usual to obtain an ordnance map and mark thereon the portions that would come under the scheme; the land which was not considered suitable was blacked out on the map.

Mr. Gunn said that if the whole of an area was included in a scheme it would be necessary to serve notices all over that area, which was very difficult.

The Chairman said that at Ruislip, where the town-planning scheme had greatly progressed, there were certain areas which had been built upon, the houses of which belonged to a large number of owners. They consequently decided not to take in that portion of Ruislip, as there might have been too many objectors. On those grounds they also decided to leave out Northwood Town. He considered the system of serving notices should be altered, and instead of that advertisements should be inserted in the public newspapers. He had been asked to preside at a meeting of owners of property, etc., who were desirous of coming under the scheme.

Mr. Gunn asked if it was desirable to include large residences under the town-planning scheme, especially houses with perhaps 20 acres of land attached to them.

The Chairman said that at one time Richmond-hill was one of the most beautiful places in the South of England. Some years ago, however, several large residences were disposed of and the land afterwards built upon. In some instances as many as thirty houses were built to the acre, and great high, ugly tenements and flats had also made their appearance, which entirely spoilt the beauty of Richmond-hill. He thought the lesson of Richmond should be taken very much to heart, and that the evil should be prevented from occurring in other places.

Mr. Woods (Surbiton Urban District Council) said he would be glad if someone would tell him the best manner in which to get the names of the owners of property, etc. At Surbiton they had proposed to take in a large number of properties, and they engaged a land agent to make an extensive survey of the properties and obtain the names of the owners, etc. The cost of that procedure was about 100*l.*, which his Council considered was rather high for an initial expense. The consequence was that the progress of the scheme was considerably hampered. As all the information necessary had been gathered by the District Valuer, under the Finance Act, he was of opinion that the Council should have access to it. With that idea he had an interview with the Controller of the Town Planning Department, and received every sympathy, but was told it was not possible for the information given in connexion with the Finance Act to also be given to local authorities. The consequence was any heavy initial expense like that had a very deterrent effect upon the scheme.

Mr. Sheldon (Ruislip-Northwood District Council) said he thought practically all the information should be in the possession of the District Surveyor. The names of the occupiers and owners of property should be on the rate-book.

Mr. Abbott said he thought Mr. Sheldon was a little mistaken. It was astonishing what a large number of names were omitted from the rate-book. He thought the best way would be to pay the 100*l.* and have the thing done properly.

Mr. Lovelock (Carshalton) said that he obtained an ordnance map, and sent out a clerk to gather the particulars necessary and mark them on the map. The result was that a permanent list was established, which required very little trouble to keep up to date.

The Chairman said in their case the work seemed to have been done by an intelligent clerk, so he supposed there must be such things.

Mr. Jenkins (Finchley Urban District Council) said in their case the Borough Engineer prepared a list and eventually obtained every name. He used the rate-book, but also had the assistance of the local estate agents, auctioneers and surveyors, etc., who were very willing to give all the information in their power. The total cost did not work out at more than 25*l.*

The representative of Walthamstow said cost in their town for discovering the name the owners was about 60*l.*; the acreage be about 1,544 acres. They had to contend w the strenuous opposition of about 200 i owners of property.

Mr. Gale (Carshalton) said that, with reg to the cost of ordnance maps, he had a le from the President of the Local Governm Board stating that maps of most towns co be obtained at a cost of 10s. each for the f one and 3s. each afterwards.

Mr. Harpur (Cardiff) said he had a differ tale to tell. In Cardiff some ten years ago t spent 5,000*l.* in the making of a survey of district.

Mr. Glen (Acton) said he should like to someone in authority how to get over a d culty his Council found themselves in. T had a very large public park there, and s discussion arose as to whether that should included when planning a town. His opin was that the park should be utilised, but he overruled by the opinion of the other mem of his Council.

Mr. Ray-Nadin (Sutton Coldfield) said t possessed a park of over 2,000 acres, but t did not think it necessary to use that. A open space which was dedicated to the pu would not be developed, and, therefore, sho not be utilised in any scheme.

Mr. Shawcross, J.P. (Rochdale), said t local authorities would have to be very car when they used land which was in the co of development, as compensation would be to the owners.

The Chairman said that some time ago wrote to the London County Council ask them to prepare a simple town plan London, including and showing all the o spaces in the scheme.

Alderman Morris (Swansea) asked whet if a town was planned on the old lines, it co afterwards be altered without any objec by the Local Government Board.

The Chairman said all town-planning sche had to be passed by the Local Governm Board.

Mr. Ward (Portsmouth) said that some ago they desired to plan a town. As the Department were in possession of a large am of vacant land, it was decided to approach t with the idea of utilising some of it. The Department, however, replied that they clai exemption from the scheme, as they requir for military purposes. Soon after that, h ever, the War Department commenced build operations on their own account and sold land to private owners. They were develo the land now and selling it in the ordinary The result was that a large number of sl ugly, and badly-planned houses had sprun upon the land. He also understood the s thing had been done at Chatham.

The Chairman said if the land was req for military purposes it was a special ma but when a Government Department carri building operations it seemed high time som should ask Parliament why a Govern Department was going, for no adequate re to be exempt from town-planning schemes

Mr. Pain said the same thing happen Chatham. The scheme was objected to b War Office, but they afterwards proceed deal with the land in their own way. The was they now had a very badly-planned t After that he came to the conclusion, ar thought it was now a generally accepted that there "were no brains in the War Offic

The Chairman said it was a state of t that should be altered evidently.

Mr. Abbott (Ruislip) said his district rapidly developing one. In January last applied to have their scheme passed, and had since held several Conferences with landowners upon the matter, and were grad dealing and eradicating the difficulties in way. He considered that local autho would be able to smooth away many a diff if they were given the power to alter by

Mr. Chriswell (Carshalton) then raise question of utilising disused burial groun the purposes of town planning.

Mr. Harold Shawcross (Rochdale) presen paper dealing with the general outline details to be considered by a local aut engaged in the preparation of a plan, the pla of roads, the cost of schemes, standar limitation of the number of houses per etc. He said that the cost of sewers wa sometimes by a general district rate, and times when the roads were first sewered charge on the frontagers. There was in

es a practice, when a sewer had to be made
ng up an outlying part of town or district,
aking a charge for entering the sewer when
r districts are joined up to it. When a
n plan was made for an undeveloped district
ould be possible to make a charge on each
se and property when the same was erected,
over the cost of sewering as applicable to
road near which a house is built. The extra
over the amount chargeable to frontagere
ld probably still be a general charge on ths
s. The main lines of the sewers could be
n on the map, but it would not probably be
ssary to fix the subsidiary lines which could
efined when houses are built. At present,
main sewer is run through an undeveloped
ict it often did not follow the line of roads
use there were no roads fixed. If a town
were made and the sewers defined they could
w the lines of the roads, thus making it
ible to get contributions from owners when
is developed fronting these roads. In
ing the roads upon a town plan it was neces-
to fix the direction of the main roads and
ably the secondary roads, but it would not
ecessary to put the exact position of roads
purely residential districts where a lighter
could be constructed. The local authority
d have carefully to consider how far the
idiary roads could be allowed and how
hey could be allowed as non-traffic roads.
resent property was often ruined by heavy,
motor traffic being driven through purely
ential streets. He thought the local
orities should be very cautious about
shing out into the great expense of making
roads themselves, but where it was neces-
for them to do so it would often be well
he local authority to get the land for the
road, but to make it of a less width at first.
could then afterwards widen it when
ired.

e Conference then discussed the advantages
iherwise of leaving strips of turf along the
instead of macadamising the whole of the
h of the road, and the general opinion
ed to be that, although by the provision of
margins they obtained a more picturesque
there was little or no saving in the cost.
. Ward said they had to cut their coat
rding to their cloth. In his district they had
many footpaths of clinker at a cost of
per yard super. After a few years it was
ssible to distinguish those paths from
macadam. They had two or three thousand
le passing over the paths daily, but they
ed no signs of wearing out.
the close of the day's proceedings a resolu-
was unanimously passed asking the Local
rnment Board to consider the advisability
pensing with the service of personal notices
d Article I., all subsequent notices to be
by public advertisement only.
. H. Shawcross (Rochdale) presided over
econd sitting of the Conference, when the
matter considered was the cost to local
orities of town-planning schemes.

Construction of Roads.

. H. Lloyd Parry (Town Clerk of Exeter)
prepared a paper dealing with the subject.
ointed out that sect. 58 of the Act pro-
that the Local Government Board may
ribe a set of general powers for carrying out
eneral objects of town-planning schemes,
n particular for dealing with the matters
t in the fourth schedule of the Act. The
matter set out in the schedule was "streets,
, and other ways, and stopping up or diver-
of existing highways." The Board had
et prescribed any such provisions, and
ng their issue the doubts that existed as to
extent of the powers of a local authority
ard to the construction of roads under a
planning scheme must continue. There
o doubt that town-planning schemes would
e general case provide for main arterial
, of a width greater than the maximum
prescribed by the existing by-laws,
or the short streets in the quiet residential
ers to be of a width less than the minimum
rescribed. The powers of a local authority
ard to the planning of their road system
practically unlimited, subject to the
val of the Local Government Board and to
yment of compensation where this was due.
compensation was what the authority
d to avoid, and the first question that pre-
d itself was whether the authority were
wered to prescribe a road of a width greater
they would require under their existing
ws without the purchase of the extra land
red. Sect. 55 provided that the by-laws might be suspended for the purpose of the scheme, but suspension involved relaxation, not extension, so that this provision did not seem to assist. Sect. 59 provided that property should not be deemed to be injuriously affected so as to give claim for compensation if the provisions were such as would have been enforceable had they been contained in by-laws made by the local authority. It appeared, therefore, that any width might be assigned to a road without entitling the owner to compensation provided the width was such as would be approved by the Local Government Board if a new by-law to that effect applicable to the particular area had been submitted by the authority. The matter was, therefore, in the discretion of the Board, who would decide the maximum width which the authority could reasonably claim. Any width prescribed in excess of that would require to be purchased by the authority failing agreement with the landowner. The Act contained no express provisions conferring power on a local authority or imposing the duty upon the landowners to construct the roads projected in a town-planning scheme.

Several speakers raised the point as to what compensation would be due to landowners in regard to delay to the development of land due to town-planning schemes, and as to what extent restrictions on land could be varied or revoked.

Mr. Parry said that conditions on land could be varied to any extent subject to compensation.

The Chairman said that local authorities in preparing plans would probably not go just where builders were developing on the outskirts, but would probably take the land a little further away. Then he took it that claims for compensation could only arise during the period of suspense if it be shown that someone had sent in plans of building to the local authority, and that development had been held up during the time the town-planning scheme was being considered. The only compensation would be for delay in building, and he did not think this would be a large amount.

Dr. Lawrence (Medical Officer of Health for Tottenham) urged the Conference to be very careful against any suggestion of relaxing by-laws. When they talked about cheap roads he asked if that meant dust. Some of the medical officers of health were afraid that in the anxiety to hurry forward town-planning schemes they might neglect establishing a reasonable and healthy minimum not only between the front building line, but between the back building line, for he knew that the greater part of the life of people in such a district as his was spent at the back of the house. Whatever might be the beauty of their architecture, the wonderful vista they had, or the number of open spaces, the verdict of the man in the street and the woman in the house would be finally given after they had read the report of the medical officer of health and seen the vital statistics and those of the disease in the districts dealt with.

Recoupment of Cost of Making Roads.

Mr. W. G. Wilkins, J.P., submitted a paper on the construction of roads by local authorities and the recoupment of the cost in the development of estates under town planning. He pointed out that the Act was for the express purpose of bringing about co-operation between local authorities and the landowners so that land likely to be used for building purposes may be planned so as to be of the greatest benefit to all the inhabitants of the neighbourhood. When the plan had the sanction of the Local Government Board it would possess the force and power of an Act of Parliament, and would represent the only way in which those landowners could at any time develop their land. Landowners were thereupon obliged to decide upon adopting one of these courses :—(1) To find all the requisite money, and to make all the bridges, roads, and streets shown upon the plan, as required upon their land. (2) To arrange with the local authority to do the work and consent to the deed which would give the authority a land tax as here suggested. (3) To keep the land for ever as agricultural land, unable to sell it for any other purpose than that specified upon the plan, knowing that any purchaser would be equally obliged, sooner or later, to adopt one of the two first-mentioned courses. If, as had been suggested, the local authority were able to get 1½ per cent. above its cost of borrowing money, and to repay the whole cost in thirty-five years, it would give its subsequent generations a steady income through the adoption of the Housing and Town Planning Act, equivalent to 5 per cent. upon the amount originally spent, after that capital outlay had been entirely repaid. The questions therefore that would arise were :—(1) The power of a local authority to construct roads, streets, or other works upon privately-owned land without the specific request of the owner. (2) The power of a local authority to average the charge for the cost according to the amount of benefit received. (3) The power of a local authority to accept a rent charge upon the land instead of demanding a cash or deferred payment. (4) The power of a local authority to borrow money for the purpose of constructing such works, either on the security of such rent charge or on the security of its general rates. The first two questions seem to be amply covered by the Private Street Works Act, 1892, where that Act had been adopted, and these powers were also evidently implied by the Housing and Town Planning Act. The third and fourth questions could only be satisfactorily answered by the Local Government Board. If, however, it was thought by representatives of local authorities that this proposed rent charge method was the simplest and most efficient way of financing town-planning schemes, then combined representation should be made to obtain official permission for this course to be adopted.

Several speakers having expressed their approval of the views held by Mr. Wilkins, the Chairman said it was merely a suggestion to them when considering schemes, and he did not know they could carry it further.

Limitation of the Number of Houses.

Mr. Raymond Unwin, F.R.I.B.A., submitted a paper on the effect of limiting the number of houses to the acre under Town Planning Acts, in which he said he had endeavoured to conclusively prove that there was no economic reason against landowners limiting the number of houses to the acre, but that, on the other hand, if the number of houses to the acre was limited and the price of land did not fall very heavily in consequence there would be an immense gain. That followed from the fact that the saving in the making of roads was distinctly in proportion to the reduction of the number of houses to the acre. Indeed, he found that it was in a greater ratio. He thought the local authorities were justified in demanding such a limitation of houses to the acre as the medical officer of health thought necessary for the community. In some cases friendly owners of estates had drawn up a scale, and this, he suggested, was the most practical scheme and the easiest way of limiting the number of houses to the acre in order to keep some relation between the size of the building and the size of the ground. The scale might either be by the cube of buildings or by the area on which they stood by a limitation as to height. A scale which he knew had been drawn up was as follows :—Houses not exceeding in cost when cubed at 6d., 225*l.*, not to exceed fourteen to the acre ; not exceeding 300*l.* in cost, twelve to the acre ; houses cubed at 6½d. and costing 500*l.*, not to exceed eleven to the acre ; houses costing 700*l.*, ten to the acre ; houses costing 900*l.* and cubed at 7d., not to exceed eight to the acre ; whilst the average over the whole estate would not exceed seven to the acre gross measure.

Mr. Neville Chamberlain said that in Birmingham they had spent a considerable time in preparing a town-planning scheme. Whilst Mr. Unwin had made out a case that the limitation of the number of houses brought about a simultaneous reduction in the cost of development, still, he did not think the figures would altogether convince people contemplating developing the land, generally for the reason that the land dealt with did not belong to a single owner, and it was no consolation to the men who lost to know that someone else gained. Local authorities must be careful, for they would have to find a lot of money for the making of roads and so on, and they looked forward to a return from the rateable value. If they put too severe restrictions on building they would drive builders to other areas, probably outside the borough. In Birmingham they had to deal with 2,000 acres. The landowner when he wished to build submitted a plan showing the general area of his land, and also a plan showing any other land in the area of the scheme, and they marked off on the plan any land they thought might be affected by the development of the land which the owner submitted. They took the whole land then and fixed the number to the acre. For instance, if they had fixed on the unit of ten to the acre, and 12 acres were to be developed, they would allow 112 houses.

Further, they fixed a certain minimum number of houses to the acre.

Mr. Harpur (Cardiff) said one point he had never heard discussed was what would happen under a town-planning scheme to an area which in years to come might become a business portion of the town, and the houses on which would require to be extended.

Alderman Thompson said that in such a case they could get a second town-planning scheme.

Replying on the discussion, Mr. Unwin said that if they had a flat rate per acre they would have a very great difficulty in regard to the building of small houses. They would simply get the big artisan's house, in which the labourer could only reside by taking another family to live with him.

Mr. Wright (President of the National Association of Master Builders) said he had been interested in the discussion, but a practical difficulty which had not been touched upon was how to provide houses for the lower working classes. The scheme they had touched on would give houses for the artisan, but there was a large class of honest, industrious workers who only earned about 25s. a week, and they wanted houses for such men at about 3s. 6d. a week. How that was to be done from the commercial point of view passed his comprehension. It was a question, however, on which they might well make representations to the local authorities for some concessions with regard to the land required for such buildings.

Alderman Thompson said he had presided over many Conferences which had considered that matter, and they would only be able to provide such buildings when they got cheaper roads, improved travelling facilities, and an amendment of the whole system of by-laws, which at present did not protect them from bad houses, but prevented them building excellent cheap houses. They also required a reorganisation of the system of credit for building purposes and an extension of the powers of societies of public utility.

The Conference subsequently discussed the question of the means of providing open spaces in town-planning areas.

CIVIC DESIGN NOTES.

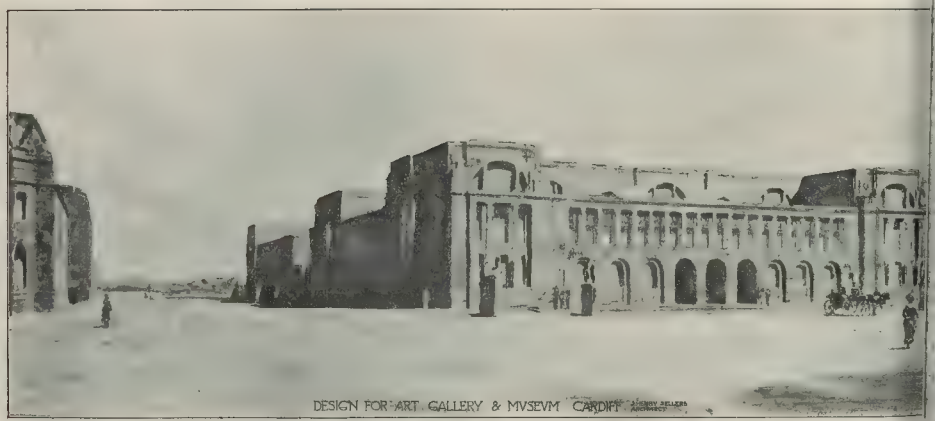
The International Road Congress, London, 1913.

THE questions to be considered and discussed at the Third International Road Congress (London, 1913) have now been settled by the Local Organising Committee with the concurrence of the Committee of the Permanent Association of Road Congresses. They include a list of the questions on which papers are invited, and on which discussions will take place at the Congress in June, 1913, and a list of the subjects on which communications are invited, but on which no discussion will take place. The questions have been arranged so as to continue the investigations from the point at which they were left by the Congresses at Paris and Brussels. Subjects that were fully dealt with at the previous Congresses have been omitted, and overlapping has been eliminated so far as possible. A new sub-section has been included to deal with "Administration, Finance, and Statistics," subjects which were not discussed at previous Congresses. A Committee consisting of Messrs. H. P. Boulnois (late of the Local Government Board), H. P. Maybury (County Surveyor of Kent), A. D. Greatorex (President of the Institution of Municipal and County Engineers), R. J. Thomas (President-elect of the Institution of Municipal and County Engineers), T. B. Heslop (Secretary to the County Surveyors' Society), and J. Walker Smith (Chief Inspector, Local Government Board for Scotland) has been nominated to select the authors of the papers for the first section (Construction and Maintenance of Roads), and a second Committee, consisting of Messrs. Shrapnell Smith (Hon. Treasurer of the Commercial Motor Users' Association and the Roads Improvement Association), J. Willmot (County Surveyor of Warwickshire), J. E. Jarratt (Town Clerk to the County Borough of Southport and Hampton Copnall, County Clerk of Nottinghamshire) to select writers on the questions in the second section (Traffic and Administration). The Chairman, Sir George S. Gibb, and the Hon. Secretaries, Messrs. W. Rees Jeffreys and G. Montagu Harris, are *ex-officio* members of both Committees. Engineers, surveyors, and individuals engaged in public administration, who have made special studies of one or more of the subjects included in the questions, and who are in a position to communicate papers or memoranda giving data and results from personal investigation since the Brussels Congress in 1908, are invited to communicate with the Hon. General Secretary at the Road Board Offices. An exhibition of road construction machinery and appliances will also be held at the Royal Horticultural Society's Hall, Vincent-square, Westminster, S.W., and on adjoining ground during the week of the Congress. Applications for space should be made without delay, and copies of the special rules and by-laws of the Exhibition and forms of application for exhibitors can be obtained on application to Mr. W. Rees Jeffreys, Hon. General Secretary, The Road Board, Queen Anne's-chambers, Westminster, S.W.

New Road, Wolverhampton to Birmingham.

THE municipal surveyors of Wolverhampton, Birmingham, and of intervening towns have prepared a report upon the proposed main road. They report that, in their opinion, the road should be 100 ft. wide, and consist of a carriageway, 35 ft. wide, two gravelled footpaths, 8 ft. wide, a turfed margin about 44 ft. wide along one side of the carriageway which could be available for a tramway or a sleeper-track, and a similar margin, 8 ft. wide, along the other side of the carriageway, with three rows of trees. As a preliminary measure, however, the Committee recommend the construction of a road 24 ft. wide, with two footpaths, the latter being laid out with turf, which, exclusive of the land, will cost, it is estimated, about 120,000*l.*

Town-Planning Schemes.



IT is stated that the Local Government Board has authorised the preparation of four schemes relating to Newcastle-on-Tyne and Sheffield. The Sheffield schemes for Sheffield affect an aggregate area of 1,000 acres within the city limits—Sandygate, Greystones, and Bannerdale; Firth Park, Wincobank, and Shire Green. In Newcastle an area of 52 acres at Craighall Dene will be dealt with. The Torquay Corporation have formulated plans for a spa in the town, involving an outlay of 15,000*l.* upon the conversion of the bath saloons into a medical bathing establishment. Mr. A. J. Taylor, of Bath, is advisory architect to the Corporation in the scheme.

Regent's Park One Hundred Years Ago.

THE *Times* reprints a graph in its issue of April 1812, which describes the laying-out of Regent's Park and the approaches. Some changes were made of the plans; the canal was dug around the north, instead of the south side of the Park, and Albany-street, on the east, was eventually chosen, in lieu of Hanover-gate, for the Household Cavalry Barracks. It is interesting to find that even in that day the conversion of "Marybone Park" aroused misgivings. The *Times* says:—

"When the roads are all completed this Park will unquestionably be a very agreeable place of residence, but not a few will regret the loss of those open and verdant fields which formed one of the most airy and pleasant resorts of the pedestrians of the metropolis."

We may here recall that Marylebone Park and Green, being 543 acres of the great Middlesex forest, owed their immunity from encroachment to having been acquired by Henry VIII. from the chase. In 1793 the Treasury had obtained 1,000*l.* premium for laying-out the farm lands and pastures of which the last lease was terminated in 1811. Nash's scheme was practically to one by Leverton and Chawner for building over nearly the whole area. His pupil, Mr. Morgan, engineer of the Regent's Canal from Paddington to Limehouse, prepared the ground, but not until 1838 were the lands admitted into the new Park (472½ acres). Decimus Burton laid out the Zoological Gardens and, with Robert Marnock, the Royal Botanical Society's Gardens, 18 acres, on Jews-harp Nursery, which at first was allotted to the Waterloo memorial and then to the Queen's palace. Nesfield laid out the flower-garden, 12½ acres, of Broad-walk.

Design submitted for the Art Gallery and Museum, Cardiff, by Mr. J. Henry Sellers.

THE BUILDING TRADE.

COVERY OF CONTRACT RICE WITHOUT THE RCHITECT'S CERTIFICATE.

HE builder who has undertaken to carry out work subject to the approval of the architect sometimes finds him- in the awkward position that he fails ecure that approval. The result is that annot obtain the certificate which, accord- to the terms of the contract, is a con- n precedent to payment of any part of contract price. In these circumstances ot unnaturally asks himself :—In what mstances may the certificate be dis- ed with?

is clear law that, in the ordinary course, rtificate may be made a condition pre- nt. As Lord Justice Mellish said, in pe *v.* San Paulo Railway (1873, L. R. . 597) :—"A contract may be so framed nder ordinary circumstances, to take the jurisdiction of the courts of law the courts of equity to determine what e amount payable under the contract. rever, according to the true construction e contract, the party only agrees to pay is certified by an engineer, or what is d to be due by an arbitrator, and there agreement to pay otherwise; that is y, in every case where the certificate of gineer or arbitrator is made a condi- precedent, unless, of course, there has some conduct on the part of the engineer e company which may make it inequit- that the condition precedent should be upon."

is to the proviso to this very clear nent of the law that the builder will n order to escape what he considers to e unjust decision of the architect, for clear that, if a certificate has been ulently or collusively withheld, or if has been a prevention by the employer, er by collusion with the architect or er, or otherwise, a certificate may be ised with.

this matter of granting certificates an ect is in a position very similar to that arbitrator; he must be impartial as s he can be, consistently with the l bias due to his position as architect of the parties, and he must do nothing istent with a judicial position. Any therefore, unknown to one of the s, or any conduct inconsistent with his l capacity, would, it would seem, dis- with his certificate.

offence may consist of not merely with- g a certificate, but in granting a certi- for less than is justly due. For e, to take an illustration which con- an architect and a local authority *v.* Llandaff Rural District Council 2, Hudson's Building Contracts, 347), eared that the plaintiff was employed defendant Council to construct certain In the contract it was provided that decision of the surveyor with respect value, amount, state, and condition part of the works executed, or of rt thereof, altered, omitted, or added, o in respect to any and every ques- at may arise concerning the construc- this contract, or the said plans, draw- pecification, or bills of quantities, or e of prices, or the execution of the nereby contracted for, or in anywise thereto, shall be final and without Disputes arose, and, after pro- negotiations, the surveyor gave his rtificate. The plaintiff brought an against the Council, in which he that the surveyor's final certificate not honestly made or given in the of, or reliance upon, his own judg- ut was made and given by reason nterference of, and in obedience to ctions and orders of, the Council." held that, as the Council had inter- though without any fraud on their th the surveyor in the exercise of his functions as quasi-arbitrator between the parties, the final certificate was not conclusive and binding upon the contractor.

When no certificate is forthcoming, the difficulty is to prove the fraud and collusion. As illustrating the circumstances in which a jury will be ready to find collusion, reference may be made to a case heard in the colony of Victoria. There an action was brought by contractors against Water Commissioners on an engineering contract; the plaintiff alleged due performance, and that the engineer fraudulently, and in collusion with the employers, had refused to certify. It appeared that the Commissioners had passed a resolution that a certificate should be given; the engineer professed to comply, but gave a document which was useless as a certificate, but expressed his willingness to certify if released personally from all responsibility. The contractors applied to the Commissioners to dismiss the architect and appoint another who would act according to the contract. This the Commissioners refused to do. The jury found that there was collusion. It was held that, though the engineer refused to give a final certificate, it was open for the jury to find from his acts and conduct that the work had been completed to his satisfaction, but that the contractor cannot recover from the employer unless it be alleged and proved that the certificate was refused in collusion with the employer. It was also held that an engineer to whose satisfaction work is to be done is not an arbitrator, but a skilled agent of the employer, and is bound to act fairly to both parties (Young *v.* Ballarat Water Commissioners (1879), 4 Vict. L. R. (Law), 306).

Fraud on the part of an architect and collusion with the building owner may also be sufficient to support an action by the builder against the architect alone for damages occasioned by the withholding of a certificate. For instance, in Ludbrook *v.* Barrett (1877) 46 L. J. C. P. 798, it was a condition precedent to payment that the builder should execute the works to the satisfaction of a named architect. Held, that an action could be maintained against the architect for collusively, fraudulently, and to the injury of the builder, refusing to certify that he was satisfied with the works.

Mr. Hudson, in his "Building Contracts," divides the cases in which a certificate may possibly be dispensed with into four classes, viz., (i.) Those where fraud or collusion was alleged; (ii.) those where fraud only was alleged; (iii.) those where before or after the giving of the certificate the engineer has shown that he will not be, or is not, impartial; (iv.) those where the employer intervenes with the architect, either before or in the giving of the certificate.

(1) *Cases of fraud and collusion.*—It is so obvious that fraud and collusion between the building owner and the architect are followed by injustice to the builder that it is not necessary to quote authorities in support of the proposition that such conduct vitiates a certificate when granted, or justifies the builder in suing the building owner direct.

(2) *Where fraud alone is alleged.*—Where fraud on the part of the building owner can be proved, which leads to the withholding of the certificate, he may be made liable, but he cannot be held liable, for the fraud of the architect unless he colluded with him. In the case of Smith *v.* Howden Union Rural Sanitary Authority and Fowler (2 H. B. C. 151) it appeared that the plaintiff, by agreement in writing dated August 5, 1885, contracted to construct certain specified sewers for the defendant Union for the price of 2,616*l.*, payable on certificate by the Engineer of the Union. There was also a clause providing that extras must be ordered in writing. The plaintiff commenced in August, 1885, and, though the work was not a success, proceeded according to the specification, and following the directions of the Engineer, and was not in default when, on July 10, 1886, the defendants took possession of the works and excluded the plaintiff. At that time 2,318*l.* only had been paid to the plaintiff.

The plaintiff sued for the contract price balance and for money due for extras, part of such extras not having been ordered in writing; and it was found by the referee that the Engineer had *mala fide* and wrongfully refused to certify, but that the defendant Union had not colluded with. Held, that the plaintiff's remedy was damages for wrongfully preventing the plaintiff from completing the contract work by wrongfully taking possession, the measure of damages being the amount to which presumably the plaintiff would have been entitled if the work had been completed, and had the Engineer thereupon issued such certificates as he ought to have issued.

In the result the plaintiff had judgment for a large amount due for extras never certified for.

Fraud and collusion will, however, be inferred where the employers know of the engineer's wilful refusal to certify, and take advantage of it. Thus in the case of Kellett *v.* New Mills Urban District Council (1900) 2 H. B. C. 239, the plaintiff agreed to do work for the defendants to the satisfaction of an engineer, and the defendants agreed to pay the plaintiff upon the certificate of the engineer. The engineer never addressed himself to determine and certify, but wrongfully refused, or wrongfully and unreasonably delayed so to determine and certify, and the defendants took advantage of his refusal and delayed payment. Fraud was not alleged. Held, that the plaintiff could recover from the defendants without a certificate.

Mr. Justice Phillimore said :—"I think that they knew here not merely that their man was not certifying, but that he was going through the process of pretended inquiry, which was almost worse than his refusing to inquire; and I think that they were bound in those circumstances to have taken some very decided action on their part.

(3) *Where the architect has shown that he will not be, or is not, impartial.*—Although it is often pointed out in legal text-books that a builder cannot expect absolute impartiality from an architect on the ground that, when he signs the contract, he knows that the architect is employed and paid by the building owner, yet the architect must show no bias in coming to a decision about a certificate. In Pawley *v.* Turnbull (1861) 3 Giff. 70, an architect took possession under a forfeiture clause, and finished the buildings. The builder filed a bill against the building owner and the architect, alleging unfair conduct on the part of the architect. Held, that it was necessary, in order to enable the plaintiff to succeed, to have proof of grossly improper conduct on the part of the architect; that the conduct of the architect (without imputing fraud) had not been of that discreet, impartial, and fair description which it ought to have been, and decreed payment to the plaintiff of the balance due under the contract, subject to a deduction for non-completion, relieved the builder from liquidated damages, declared the architect's certificate not binding, and ordered both defendants to pay the costs of the suit.

(4) *Interference by the employer.*—The last case in which the builder is entitled to ignore the provisions of the contract as to a certificate, and sue the employer direct is that in which the employer interferes with the architect. The question whether there was such interference is, of course, one of fact for a jury to decide. For instance, where an action was brought by a builder against the building owner under a contract by which the architect's certificate was a condition precedent to payment. Plaintiff alleged that the employer, after the work was completed, complained to the architect of alleged defects therein, and told him that he should not accept his certificate unless those alleged defects were attended to and remedied. The defendant denied this, and

produced evidence to the effect that there had been no communication at all between the defendant and the architect. Watkins Williams, J., to the jury :—"If you think that the architect, acting upon his own judgment, withheld this certificate, you must find a verdict for the defendant. If, however, you are of opinion that the withholding of the certificate was due to the improper interposition of the defendant, and that he prevented the architect from giving his certificate, you must find a verdict for the plaintiff." The jury found a verdict for the plaintiff (Brunsdon *v.* Beresford (1883), I. Cab. and El., 125).

It remains to consider other circumstances in which the certificate of the architect will be regarded as dispensed with. If, for instance, the contractor is prevented from carrying out the work by the act of the building owner, or by any act of the architect for which the employer is in law responsible, the certificate will not be a condition precedent. The following may be cited as illustrations :—Failure by the architect to deliver plans, the absence of which prevents the contractor getting on with his work: dismissal of the architect; failure to invest the architect with the necessary authority to grant certificates.

The question whether acceptance of the completed work by the employer operates as a waiver of the certificate, and is one of fact to be decided in each case.

It is, at any rate, clear that mere acceptance of a completed building does not constitute a waiver, because the building, being on the employer's land, he cannot avoid taking possession. Thus, where there was a contract between a builder and a building owner, it was agreed that the work was to be done to the satisfaction of the surveyor, upon whose approval payment was to be made by a time fixed. They were not completed by the time, but were alleged to have been completed five days afterwards, when plaintiff applied for payment. The building owner refused to pay without the certificate of the surveyor, who declared them to be incomplete, and refused to certify. In an action by the builder for the contract price, and in the alternative for a *quantum meruit*, the defendant pleaded that he did not dispense with completion within the fixed time, and that the work was not completed to the approval of the surveyor. Held, on demurrer, that both pleas were good. At that time the building owner was in occupation of the house, there being no other evidence but bare possession. Held, that the plaintiff could not recover in the absence of a certificate, and that the mere fact of the owner's taking possession of his own land, on which the buildings had been erected, did not afford an inference that he had dispensed with the conditions in the contract to pay for the work and labour actually done (Munro *v.* Butt (1858), 8 E. and B. 738).

What is true of a building is also true of works which form the subject of a large contract.

BATH MASTER BUILDERS' ASSOCIATION AND QUANTITIES.

AT a recent meeting of the Bath Corporation Markets Committee a deputation attended from the Bath Master Builders' Association. The spokesman, Mr. Erwood, referred to some proposed work at the Cattle Market, tenders for which had actually been received, and asked that they should be supplied with detailed quantities for the work. He explained that at the present time architects and surveyors practically all over the country were giving these quantities without being asked for them, in the interest both of employers and contractors. It saved a great deal of dispute afterwards as to what was included in the specification and drawings. The builder's work was entirely different from most trades. They had to guess beforehand what a thing would cost, and then, if he might use an historic phrase, they had to "wait and see" if they were right. It was nearly always the builder who made the biggest mistake in taking off his own quantities who got the job. In this instance they had been supplied with what he should call an enlarged specification. As a result of the conversation, it was resolved to accede to the request of the deputation and again advertise for tenders. It was decided that the tenders already received should not be opened.

GENERAL BUILDING NEWS.

CHURCH OF ST. MARY, SOUTHAMPTON.

It is proposed to complete the Church of St. Mary, Southampton, by the erection of the tower and spire. This church was erected in 1879-84, at a cost of about 25,000*l.*, in place of the old parish church, and as a monument to the late Bishop Wilberforce. It is a building in the early English style, designed by the late Mr. G. E. Street, R.A. The church stands on the site of an earlier church dating from the XIth century. The register dates from the year 1650, the earlier portion having been burned.

CHURCH, HARROW ROAD, LONDON.

A small church building is being erected in Cirencester-street, Harrow-road, by Messrs. E. A. Roome &. Co., of 36, Basinghall-street, E.C. The architect is Mr. E. H. N. Major, John-street, Bedford-row, W.C.

COUNTY SCHOOL, BASINGSTOKE.

The designs for this new school are by Mr. A. L. Roberts, the architect to the Education Committee, and the building, when erected, will accommodate 160 girls. There are six classrooms, cookery-room, scullery, central hall, etc., and the contract is being carried out by Mr. W. H. Tigwell, builder, of Basingstoke.

NEW BUILDINGS IN LONDON.

Shops, offices, etc., High Holborn, W.C.; Messrs. Dove Brothers, builders, 15, Studd-street, Islington, N. Shops, showrooms, etc., Bond-street, W.; Mr. C. F. Kearley, builder, 4, Great Marlborough street, W. Shops, showrooms, etc., Vere-street, W.; Messrs. W. J. Fryer & Co., builders, Bravington Works, Harrow-road, W. Conversion of hospital into shop premises, Mitcham-lane; Messrs. E. & A. Watts, builders, 85-7, Mitcham-lane, S.W. Operating theatre, etc., Mile End, E.; Architect to the Mile End Guardians, Bancroft-road, Mile End, E.

TRADE NEWS.

Mr. W. Draper Brinckle, architect, 2616, West Sixteenth-street, Wilmington, Delaware, U.S.A., would like to receive English catalogues of building material.

Under the direction of Mr. George A. Sexton, F.S.I., M.S.A., Kilburn, N.W., the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Holy Trinity Church, Kilburn, N.W.

A feature of the fireproof curtain at the London Opera House is the patent stop or bolt that prevents the curtain from buckling inwards if a fire should occur on the stage. Messrs. T. W. Vaughan & Co. inform us that two bolts are fixed in the stage floor, one under the curtain in the guide and the other near the centre of the stage, on the stage side of the curtain. These two bolts are counterbalanced, so that when the curtain descends the striking bolt in the curtain guide is pressed down, causing the centre stop to rise behind the bottom frame of the curtain, making a rigid stop that will prevent any movement of the curtain when once down.

Messrs. E. P. Allam & Co., electrical engineers, 28, Gray's Inn-road, London, W.C., have been successful in securing the contract for the electric light installation at St. Nicholas Church, Taplow.

Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester, have just supplied their patent warm-air ventilating Manchester grates to the Rural District Council Offices, Durham.

A DECEASED CONTRACTOR'S ESTATE.

Mr. John Martin, of Galwally House, New townbreda, Belfast, contractor, has left estate proved as of the gross value of 59,566*l.*

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontages and Projections.

Brixton.—Retention of a wood, glass, and zinc roof at the side of No. 144, Coldharbour-lane, Brixton, abutting upon Eastlake-road (Mr. F. Karno).—Consent.

Chelsea.—Re-erection of "Shelley House," Chelsea-embankment, to abut upon Embankment-gardens (Mr. E. Warren for Mr. C. H. St. John Hornby).—Refused.

City of London.—Two three-story projecting oriel windows at Nos. 22-25, Farringdon-street City (Mr. H. O. Ellis for the Amalgamated Press, Ltd.).—Consent.

Finsbury, Central.—Projecting one-s portion of 234, Pentonville-road, Finsb (Messrs. Lovegrove & Papworth for Mr. H V. Harraway).—Consent.

Hackney, North.—Erection of buildings u a site on the eastern side of Stamford-H Hackney, northward of No. 126, Stamford- (Messrs. Edmondsons, Ltd.).—Consent.

Hackney, North.—Erection of sham h timber work, porches, oriel windows, wooden balustrading at sixteen propo houses on the western side of Ashtead-r Hackney (Mr. R. A. Reader for Mr. D Barclay).—Consent.

Hackney, North.—Erection of bay-wind and porches to Nos. 17 and 19, Shacklew lane, Kingsland (Messrs. H. Bradford & Sc —Consent.

Hammersmith.—Erection of a building the northern side of Great Church-lane, H mersmith (Mr. H. W. Sanders for Me Fullers, Ltd.).—Consent.

Hampstead.—Conversion of a porch inf bay-window at No. 66, Fellows-road, Ha stead (Messrs. Dolman & Pearce for Mr. H. Snow).—Consent.

Holborn.—Two showcases and two proj ing signs, and the erection of two stall pl at the "Niche," adjoining the southern of Hampden House, Kingsway (Mr. E. Lewis).—Consent.

Holborn.—Illuminated sign at the Prince's Theatre, Shaftesbury-avenue, Holi (Messrs. J. R. Offer & Sons for Messrs. W F. Melville).—Consent.

Islington, North.—Two showcases at 247, Seven Sisters-road, Islington (Messrs Taplin & Co.).—Consent.

Kensington, North.—Erection of an exte flight of wooden steps at No. 42, Pembri road, Kensington (Mr. E. Perfect).—Conse

Kensington, North.—Projecting wooden s at No. 26, Clarendon-road, Kensington H. W. Currey).—Consent.

Kensington, South.—Retention of a sig No. 4, Bute-street, Kensington (Messrs. V & Co.).—Consent.

Lambeth, North.—Retention of an illu nated sign at No. 156, Westminster-br road, Lambeth (Messrs. S. R. and Bo Worns).—Consent.

Lewisham.—Iron and glass porches to houses on the northern side of St. Mildr road, Lee (Mr. G. A. Lansdown for Mo W. J. Scudamore & Son).—Consent.

Lewisham.—Retention of a conserv addition at the rear of No. 179, Hither G lane, Lewisham (Mr. L. Harman).—Conse

Lewisham.—Projecting bay-windows, por hoods, and oriel windows to sixteen hous the eastern side of Manwood-road, Lewi (Mr. J. Nicholls).—Consent.

Lewisham.—Porch at the side of No Bovill-road, Lewisham, next to Ackroyd (Messrs. Dunsmore Brothers).—Consent.

Lewisham.†—Iron and glass shelter in of a "picture palace" on the southern si Sangley road, Catford (Messrs. Norfo Prior for Mr. J. Wall).—Refused.

Marylebone, West.—Iron and glass shel front of Nos. 268 and 270, Edgware roa Marylebone (Messrs. Gale, Durlache Emmett for the Home and Colonial S Ltd.).—Refused.

Peckham.—Porches to seven houses o north-western side of Ormside-street, Pec (Mr. J. Watts for Mr. A. Seaward).—Co

St. George, Hanover-square.—Iron and shelter in front of No. 51, South-street, fair (Messrs. G. Trollope & Sons and & Sons, Ltd.).—Refused.

St. George, Hanover-square.—Iron and shelter in front of the porch of the C Hotel, Carlos-place, Grosvenor-square (M Anderson).—Consent.

St. George, Hanover-square.† Proj sign in front of No. 64, Conduit-street (M Owensmith).—Consent.

St. George, Hanover-square.—Refaci No. 18, Wilton-crescent, St. George, Ha square (Messrs. Hatchard, Smith, & S Mrs. Darrel).—Consent.

St. George, Hanover-square.—Pro coach-house doors in front of No. 5, mews, Lyall-street, St. George, Hanover (Mr. A. L. Isenberg).—Consent.

St. Pancras, East.—One-story build No. 7, Camden-road, St. Pancras (M Atkinson for the Gas Light and Coke pany).—Consent.

St. Pancras, South.—Projecting facia ported on brackets, in front of No. 49, road, St. Pancras (Mr. A. Davis).—Cons

Strand.†—Projecting oriel window conies, and a cornice at Nos. 39 a Jermyn-street, St. James's-street Emden, Egan, & Co. for Mr. J. Roch Consent.

Strand.—Projecting porch at the Ma Hospital, Dean-street, Soho (Mr. A. Saxe for the Governors of the hospital).—Co

Wandsworth.—Erection of a one-story addition at the rear of Nos. 103, 105, and 107, Tetcham-road, Tooting, to abut upon the south-eastern side of Franciscan-road (Mr. P. Hills for Messrs. Smith Brothers).—Consent.

Width of Way

Hammersmith.—Addition at "Ravenscourt," Ravenscourt-square, Hammersmith (Mr. C. Conner for Mr. R. B. Rathbone).—Consent.

Holborn.—Erection of an addition at Christ Church, Woburn-square, to abut upon the north-western side of Upper Montague mews (Mr. S. B. K. Caulfield for the Vicar and Churchwardens).—Consent.

Islington, North.—Addition at the rear of Nos. 490 and 492, Holloway-road, Islington (Mr. C. T. Lee for the London County and Westminster Bank, Ltd.) —Refused.

Kensington, South.—Erection of greenhouses at No. 1, Holland-park, with a boundary fence (Mr. H. W. Currey for Mr. W. F. Fladgate).—Consent.

Lambeth, North.—Alterations at No. 42, Tyer-marsh, Lambeth (Mr. W. J. Kemp, for Mr. C. Liell).—Consent.

Pancras, West.—Erection of a building but upon Redhill-street and Little Edward-street, St. Pancras (Messrs. Pilditch & Co. for Mr. W. S. Shepherd).—Consent.

Southwark, West.—Buildings upon a site on the southern side of Orange-street, Southwark (Messrs. F. J. Eedle & Meyers for the Hope Street Factory, Ltd.).—Consent.

Whitechapel.—Erection of a building on the north-western side of Half-Moon-passage, Whitechapel (Messrs. Joseph & Smithem for Mr. Lionel de Rothschild and others).—Consent.

Width of Way and Projection.

Southwark, West.—Erection of a projecting internal iron staircase at the premises of the Idenhall Press, Ltd., on the western side of Duncan-street, Southwark (Mr. G. A. Lansdale for the Leadenhall Press, Ltd.).—Consent.

Line of Frontage and Space at Rear.

George, Hanover square.—Seven houses on the eastern side of Park-street, St. George, Hanover square, to abut also upon the southern side of Upper Grosvenor street and the western side of Reeves-mews (Mr. W. Willett).—Consent.

Lines of Frontage and Construction.

City of London.—Erection of an external iron gangway across Manchester-avenue, City, to connect Nos. 3 and 19, Manchester-avenue (Messrs. William Smith (Camberwell), Ltd., for the Clients' Investment Company).—Consent.

Deptford.—Two temporary showcases in front of No. 251, New-cross-road, Deptford (Messrs. R. & J. Foster).—Consent.

Hackney, Central. Temporary one-story addition at No 1, Church-road, Kingsland, building upon the western side of De Beauvoir-road (Mr. P. Foot).—Consent.

Hammersmith.—Erection of an iron and glass shelter at the new entrance to Ravenscourt-park Station on the eastern side of Goldhawk-road, Hammersmith (Mr. J. W. Lamb Hood for the London and South-Western Railway Company).—Consent.

Hampstead.—Motor-car shed on the forecourt of No. 112, Finchley-road, Hampstead (Mr. H. Harris).—Consent.

Rotherhithe.†—External iron and concrete subways over the public way of Essex-place, to connect premises on the southern side of Rotherhithe-street, Rotherhithe (Messrs. Joseph Arnithem for the London Metallic Capsule Company, Ltd.).—Consent.

Width of Way and Space at Rear.

Hammersmith.—Re-erection of a building on the northern side of King-street, Hammersmith, to abut upon the eastern side of Dimes-place (Mr. J. W. Hawkins for Mr. W. J. H. Hall and others).—Consent.

Width of Way and Construction.

Deptford.—Erection of a temporary wood and iron building at the premises of Messrs. J. Musslewhite & Son, on the eastern side of the Grand Surrey Canal, and the northern side of Windmill-lane, Deptford (Mr. W. H. Bailey for Messrs. C. H. Musslewhite & Son). Consent.

Greenwich.—Retention of a wood and glass portion of a temporary character to a coach house at No. 66, The Stowage, Deptford (Mr. Edwards).—Consent.

Kensington, South.—Erection of a temporary wood and iron building at the rear of No. 98, Queen's-gardens-terrace, Kensington, to abut upon Palace-gardens-mews (Messrs. Humphrys, Ltd., for Mr. G. P. Harben).—Consent.

Paddington, South.—Addition to a garage at the rear of No. 15, Sovereign-mews, Paddington (Mr. A. Turner).—Consent.

Space at Rear.

Wandsworth.—Erection of No. 141, Mitcham-lane, Wandsworth, with an irregular open space at the rear (Mr. J. Harding).—Consent.

Formation of Streets.

Hampstead.—Formation or laying-out of streets for carriage traffic to lead out of Redington-road and Templewood-avenue, Hampstead (Messrs. Farebrother, Ellis, & Co.).—Consent.

Alteration of Buildings, etc.

Kensington, South.—Alterations at No. 3, Campden-hill-square, Kensington (Messrs. Chesterton & Sons).—Consent.

Strand.—Alterations and additions at Derby House, St. James's-square, Westminster (Messrs. Edmeston & Gabriel).—Consent.

Westminster.—Alterations at No. 37, Parliament-street, Westminster (Messrs. Joseph & Smithem for the Express Dairy Company).—Consent.

Line of Frontage and Uniting of Buildings.

St. George, Hanover-square.—Erection of forecourt steps to a building known as Nos. 313, 315, and 317, Vauxhall-bridge-road, and Nos. 12 and 13, Wilton-road, Westminster (Messrs. Z. King & Son).—Consent.

Alteration of Buildings and Cubical Extent.

Rotherhithe.—Erection of additional story at No. 120, Tower-bridge-road, Rotherhithe (Mr. J. M. Kennard).—Consent.

Cubical Extent.

Kensington, South.—Erection of an addition to the premises of Harrod's, Ltd., upon the site of Nos. 37 and 39, Hans-road, Kensington (Mr. C. W. Stephens for Harrod's, Ltd.).—Consent.

Uniting of Buildings.

City of London.—Uniting of No. 132, Salisbury-square, City, with St. Bride's House, St. Bride's passage, at the ground floor level (Mr. F. J. Smith for Messrs. J. Haddon & Co.).—Consent.

City of London.—Uniting of Nos. 16 and 17, Bury-street, St. Mary Axe, City (Mr. G. Ashby). Consent.

Deptford.—Armoured doors in lieu of iron doors to staircase openings in a division wall at the premises of Messrs. A. G. Scott & Co., Ltd., Hanlon-street and Grove-street, Deptford (Mr. L. Jacob).—Consent.

Deptford.—Formation of an opening between Nos. 199 and 201, Deptford High-street (Mr. E. J. Francis).—Consent.

Finsbury, East.—Formation of an opening between Nos. 226 and 228, Old-street, Finsbury, at the fourth-floor level (Mr. S. Clifford Tee for Messrs. Lefever).—Consent.

Finsbury, East.—Further uniting of Nos. 17 to 20, West Smithfield, by means of an opening at the fourth-floor level (Fireproof Doors, Ltd.).—Consent.

Hackney, Central.—Uniting of Nos. 183 and 185, Sandringham-road, Hackney (Messrs. G. Billings, Wright, & Co., for Miss Hawkins). Consent.

Holborn.—Uniting of No. 33 with Nos. 34 and 35, Kirby-street, Holborn (Messrs. Bird & Walters for Mr. F. P. Wilson).—Consent.

Holborn.—Opening at the second-floor level, connecting Nos. 77-79, Farringdon-road, Holborn, with warehouse premises abutting upon Castle-street (Messrs. Marshall, Sons, & Co., Ltd.).—Consent.

Rotherhithe.—Armoured doors and an iron shutter in lieu of iron doors to certain openings at Nos. 5, 7, 9, and 9a, Tooley-street (Topping's Wharf), Rotherhithe (Messrs. H. Langston & Co.).—Consent.

The recommendations marked † are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERCARN.—Additions to works for Messrs. Richard Thomas & Co.

Accrington.—Weaving shed, near Penny-house-lane, for the Accrington Mill Building Company, Ltd.

Arbroath.—Extensions to engineering works of Messrs. James Keith & Blackman Company, Ltd.

Banbury.—Extensions to infirmary (520*l.*); Messrs. Kimberley & Sons, builders, Banbury.

Bedminster.—Free library (9,000*l.*): Mr. T. H. Yabbicom, Surveyor, Town Hall, Bristol.

Blackburn.—Weaving shed for the East End Mill Company (Blackburn), Ltd.

Bolton.—School (5,000*l.*); Trustees, St. George's-road, Congregational Church, Bolton.

Bradford.—Alterations to workhouse (2,100*l.*); Messrs. Collier & Catley, Ltd., builders, St. Mary's Butts, Reading.

Carnoustie.—Entertainment hall; Mr. J. D. Swanston, architect, Kirkcaldy.

Cathcart.—Church hall, corner of Holmlee-road and Garry-street; Trustees, Battlefield Congregational Church, Cathcart.

Clydebank.—Additions at yard of Messrs. John Brown & Co., shipbuilders.

Colston (Glasgow).—Church and hall with offices, Springburn road, Colston Church Trustees.

Conisborough (Rotherham).—Baths (1,180*l.*); Mr. H. Saville, builder, Conisborough.

Crewe.—Proposed bakery (10,000*l.*) for the Crewe Co-operative Society.

Croydon.—Handicraft centre, Boston-road (920*l.*); Messrs. George E. Everitt & Sons, Ltd., builders, Windmill road, Croydon.

Denistoun (Glasgow).—Six tenements, Aberfoyle-street, Alexandra Park Property Company, 65, Bath-street, Glasgow.

Fergusiie.—Spinning mill for Messrs. J. & P. Coats, Ltd., Paisley.

Frodingham.—Enlargement of St. Laurence Parish Church; Mr. H. Marrows, builders, 84, Garden street, Great Grimsby.

Glasgow.—Alterations and additions to buildings, Royal Exchange, for the Society of Proprietors of the Royal Exchange Buildings, Glasgow, Ltd.

Great Harwood.—Catholic school; Messrs. Higson & Sons, builders, 42, Byron-street, Blackburn.

Hayes.—Machine factory, Blyth-road, for the Gramophone Company; factory, Silverdale road, for the X-Chair Patents Company.

Helensburgh. — Hall, William-street (170 places); Rector, St. Michael's Episcopal Church, Helensburgh.

Irton.—Pumping-station; Mr. William Millhouse, Water Engineer, Town Hall, Scarborough.

Kettering.—Proposed improvements at baths and provision of slipper baths; Mr. T. R. Smith, Surveyor, Council Offices, Kettering.

Lincoln.—Improvements at county hospital (1,100*l.*); Clerk to the Governors.

Mansfield. — United Methodist Church, Nottingham-road (7,000*l.*); Messrs. George Baines & Son, architects, 5, Clement's Inn, Strand, W.C.

Neilston.—Building, Main-street, for the Barrhead Co-operative Society.

Oakham.—Additions to school (3,345*l.*): Messrs. Nicholls Brothers, builders, Chapel-street, St. Ives, Cornwall.

Radstock.—Thirty houses (6,600*l.*); Messrs. Bird & Son, builders, Radstock.

Rawtenstall.—Weaving shed, warehouse, etc., Lower Mill, for Messrs. Whitehead & Co.

Renton.—Public school (2,500*l.*); Mr. A. C. Denny, architect, Dumbarton.

Rishton.—Warehouse, Wheatfield Mill, for the Wheatfield Manufacturing Company, Ltd.: mill, Knowles-street, for the Rishton Mill Building Company, Ltd.

Scarborough. — Catholic church, Avenue Victoria, South Cliff; Messrs. John Petch & Son, 6, Westborough, Scarborough.

Seaforth.—Alterations to Seafield House (12,000*l.*); Messrs. W. Hall & Sons, builders, 60, Christian-street, Liverpool.

Southampton.—The following plans have been passed:—Additions, Eye Hospital, Bedford-place, for Mr. A. F. Gutteridge; three houses, Kenilworth and Harborough roads, for Mr. F. W. Young, jun.; alterations and additions, Bevois Town Hotel, Middle-street, for Messrs. Weston & Burnett; additions, Bitterne Park Hotel, Cobden-avenue, for Mr. H. Lawrence; additions, Sunlight Laundry, Winchester-road, for Mr. G. R. Long. Plans have been lodged for the construction of a sewer and for the erection of three houses in Highfield-lane, by Messrs. Lemon & Blizard; and for fifteen houses, Oakmount-avenue, Brookvale-road and Russell-place, by Mr. J. Smith.

Southend-on-Sea.—Alterations to theatre, Leigh-road, for the Raymond Animated Picture Company.

Studley.—School (200 places); Mr. Bolton King, Secretary, Education Committee, Warwickshire County Council, County Buildings, Warwick.

Twickenham.—Almshouses. Church-street, for Messrs. Senior & Furbank, Bank-chambers, Richmond. A plan has been lodged for a cinematograph theatre in Richmond-road, for Mr. R. B. Rowell.

Urmston (Manchester).—Institute (2,000*l.*); Rev. E. H. Cooke, Vicar, St. Clement's Church, Urmston.

Woodford. — Special instruction centre (1,768*l.*); Mr. W. J. Maddison, builder, Clarkson-street, Canning Town, E.

Worksop. — Rebuilding work at Priory Church (12,000*l.*); Vicar, Worksop.

York.—Receiving homes (1,840*l.*); Mr. W. Birch, builder, York.

* See also our list of Competitions, Contracts, etc., on another page.

THE INTERNATIONAL BUILDING EXHIBITION, LEIPZIG, 1913.

WE understand that the object of this exhibition is "to bring before public notice in all parts of the globe a vivid picture of the status of architecture and the building of dwellings from a scientific and artistic point of view and to reveal its social and economical meaning." The undertaking is intended to reveal the importance which the "united work of theory and practice, of science, technical labour, and industry, has had, and will gain yet, for the development of architectural building. In the Universal Exhibition for Architecture and Dwellings there will be a department devoted to showing the great public representations and pictures of modern technical improvements. The exhibition will bring before the public "engineering architecture" so as to give a better understanding of the technical inventions that are not so easily grasped as simple architectural works."

The management of the scientific department of the Architectural Exhibition is in the hands of Herr Ewerbeck, Government Architect, of Berlin. A palace will be erected for the purpose in the exhibition grounds, which will be the home of the scientific department. It will comprise the following points of view:—

Section 1.—The scientific structure of architectural works, which will include the requirements for the principles of drawing up architectural plans; materials, working of and proving building materials; the execution of buildings; representations of plans in general and in particular.

Section 2.—The second large section includes the artistic structure of architectural buildings with their environs.

Section 3.—Section three represents the scientific and artistic structure of streets as a whole, town-planning, and settlements.

Section 4.—A fourth section shows modern improvements in building from a hygienic point of view.

In addition to the particular scientific department there are separate courts devoted to the science of building, wherever there should happen to be more space wanted for industrial exhibits. Besides this the exhibition buildings of the Province of Saxony and the town of Leipzig will offer scientific material. Foreign countries will be represented in their own particular scientific groups.

THE LONDON COUNTY COUNCIL.

THE first weekly meeting after the Easter recess of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

LOANS.—The Finance Committee recommended that loans should be made to borough councils as follows:—Hackney, 3,468*l.* for electricity mains; Westminster, 91,500*l.* for street improvement; Islington, 2,581*l.* for poor law purposes.

ADDITIONAL PUMPS.—In a report of the Main Drainage Committee it was stated that it was advisable to provide additional pumping power at the Falconbrook pumping-station at an estimated cost of 9,500*l.*

THEATRES, ETC.—The following drawings have been approved by the Theatres and Music Halls Committee:—Adelphi Theatre, Strand—Provision of a hot-water boiler, and removal of a wall enclosing the coke store; Alhambra Palace of Varieties—Alterations to dressing-rooms; 538 and 540, Kingsland-road—Additions to the electrical installation; King's Picture Playhouse, Chelsea—Arrangement of the curtain-raising gear; Malden-road, Kentish Town—Provision of a new means of approach to the cinematograph enclosure; New Prince's Theatre, Shaftesbury-avenue—Alterations to the apparatus for raising the safety curtain; 165, Oxford-street (cinematograph hall)—Raising of the rear portion of the ground floor; Paragon Theatre of Varieties, Mile End-road—Rearrangement of stalls and balcony seating and provision of glass screens on both sides of the stalls; Pavilion Theatre, Whitechapel-road—New cinematograph enclosure and rewinding rooms; Royal Academy of Music—Rearrangement of gallery steppings; it is also proposed to erect a cinematograph hall at 114, 116, and 118, Theobald's-road, W.C., and the Committee recommended that the drawings for the same be approved.

WESTMINSTER CITY COUNCIL.

AT the fortnightly sitting of this Council on April 25 the following matters were dealt with:—

National Gallery Extension.—Last year the Council adopted a proposal of H.M. Office of Works to acquire some land for the purpose of forming with land to be added by the Office of Works a widening and prolongation of St. Martin-street, between Orange-street and Trafalgar-square. The Office of Works have now definitely informed the Council that they had abandoned the construction of the new street in order to secure the fullest possible measure of security to the National Gallery against fire. With regard to the vacant space between the National Gallery and the premises of Messrs. Hampton & Sons, the Council understood the intention was to form a courtyard, which in due course will be turf clad.

Building in Piccadilly.—The Improvements Committee reported having again approached the Office of Works regarding the unprecedented delay in the rebuilding of 19 and 23, Piccadilly.

Paving Contract.—The Highways Committee reported the receipt of a letter from the Limmer Asphalte Paving Company, Ltd., dated March 26, with reference to the Council's decision to exercise their option to continue the existing contract for the maintenance of the asphalt carriageway of Victoria-street for a further period of five years, terminating on March 31, 1917, stating they will carry out the terms of the contract to the best of their ability. As regards the Council's inquiry what further reduction in the contract price the company would be prepared to make if the contract were extended for a further period of five years from March 31, 1917, the company say that, while always desirous of in every way meeting the Council with regard to contracts, yet, taking into consideration the continual rise in the cost of raw materials, freights, and wages, they have, after careful consideration, been forced to the conclusion that they cannot offer any further reduction; they would, however, be willing to continue for a further five years at the rate for the five years ending March 31, 1917.

LEGAL COLUMN.

Workmen's Compensation.

A curious and important point under the Workmen's Compensation Act has come for decision before a Judge of the King's Bench Division in the case, Smith's Dock Company, Ltd., *v.* John Readhead & Sons, Ltd.

The plaintiffs, ship repairers, had hired from the defendants a dock, and were carrying out certain repairs in the dock upon a vessel, when an accident occurred to one of their workmen on February 14, as a result of which he died on February 18. For the purposes of the case it was admitted that the accident was due to negligence on the part of the defendants' servants.

The deceased man left only one dependent, an illegitimate daughter, who took proceedings against the plaintiffs under the Workmen's Compensation Act, and an award was made in her favour of 203*l.* 0s. 1d.

In the proceedings in question the plaintiffs were seeking to recover this sum from the defendants. Such proceedings have to be taken under sect. 6 of the Act, which commences:—"Where the injury for which compensation is payable under this Act was caused under circumstances creating a legal liability in some person other than the employer to pay damages in respect thereof," the workman is to have the option of proceeding against either, but shall not be entitled to recover both compensation and damages.

Now, as the workman had died, any right of action he himself would have had had abated, and the action, apart from the Workmen's Compensation Act, could only be brought under Lord Campbell's Act, which is limited to legitimate dependents; therefore it was argued that in this case there was no alternative remedy open to the illegitimate dependent, but her sole remedy was under the Workmen's Compensation Act against her father's employers. The learned Judge said that the case was one of difficulty, but he held that the moment the injury was caused there was a "legal liability" in some person other than the employer. The case is curious, because supposing the man had been instantaneously killed it is clear that then no legal liability could by any possibility be said to exist except under the Workmen's Compensation Act by his dependents against the employers. There would be no claim open against the stra firm in such circumstances.

In making employers liable for the ille mate dependents of their workmen the W men's Compensation Act marked a curious new departure in our law, and if the a decision is correct the Act has affected legal liability of third parties.

Rebuilding Mansion House Settled Estat

A point of some interest to owners of has recently been decided by a Judge of Chancery Division in a case *re* Wyndh Settled Estate. The tenant for life was building the mansion house, and the ques was—What sum could be allowed out of capital settled sums in respect of his expe ture? By sect. 13 of the Settled Land 1890, improvements authorised by the Set Land Act, 1882, shall include "The rebuil of the principal mansion house on the set land, provided that the sum to be app under this sub-section shall not exceed one- of the annual rental of the settled land." Court held that the words "annual rent must be read literally as the total amoun the rents payable to the landlord. If part of the land was unoccupied, this however, also to be considered as produc the rent usually paid for it. Moreover, ascertaining the annual rental, no deducti ought to be made for tithes, land tax, drain rates, or rent charges.

The figures in this particular case illustrate the importance of the decision. gross income of the estate was 4,265*l.*, the going, tithes, land tax, drainage rates, a charge, and interest on mortgage amou to 2,094*l.* 0s. 9d., leaving a net income 2,171*l.* 19s. 3d. The cost of building mansion house was 5,127*l.* 14s. 8d., and tow this the Court allowed half of the gross re viz., 2,132*l.* 10s.

Trade Union Law.

The recent case, Dallimore *v.* Williams Jesson, tried before a Judge and a spe jury, raised some interesting points. action was brought by the conductor proprietor of a band against two member the Amalgamated Musicians' Union, wh was alleged, had induced some members of band to break their contracts by threats pickets, and also the action was for libel slander. After a trial lasting several d the Judge ruled that there was no cas regards the slander, but on other point left the case to the jury, who answered cer questions as follows:—Did the defend without justification and with intent to injur plaintiff, (1) procure and induce the plain employees to break their contracts?— Interfere with the plaintiff's business?— Did they conspire to commit the acts set in question?—Yes. Did Jesson publish libe statements of the plaintiff, and if so, they true?—Jesson published libellous s ments which were untrue. Was there a t dispute?—No. Were the defendants' act contemplation or furtherance of a trade pute?—No. Were the defendants' acts out of spite?—Yes. The damages assessed at 400*l.* for the conspiracy, etc., 100*l.* as against Jesson for the libel, and j ment was given for these amounts; but costs of the issue of the libel were all as regards Williams.

Now, in reference to the conspiracy, in ment to break contracts, and interference the plaintiff's business, the case is clear, a protection afforded trade unionists by Trade Disputes Act, sect. 3, is limite action taken in contemplation or furthe of a trade dispute, and the jury found there was no such dispute in contempl or existence.

This point is covered by the decisio Conway *v.* Wade (the *Builder*, Augu 1909).

The libel raises a more interesting que as it is an action for tort, and sect. 4, is in general terms, and the operative section of which makes no mention of disputes, prohibits the Courts from ente ing such actions against trade unions or members. In the recent case, Vacher & *v.* London Society of Compositors, note us, the *Builder*, April 12 last, the Cou Appeal had to consider a case of libel then the tort was committed, *i.e.*, the was published, in contemplation or furthe of a trade dispute, and the majority Court held that sect. 4 of the Trade Dis Act applied and the action could n entertained.

In this case the Court did not decide wh the section applied when the libel wa published in contemplation or furtheran a trade dispute, but there are *dicta* i judgments of the Lords Justices who gav majority judgments which give the impr

they consider the section general in its ...ation. There is a case, Rickards *v.* ...m, where a Judge of First Instance held ... was jurisdiction to entertain such an ... unless the libel was published in con... ation or furtherance of a trade dispute. ...aw on the subject is, therefore, in a unsatisfactory condition, and a decision ... Court of Appeal or the House of Lords ...ch needed. All that can be said is that ...ms bad enough that libel should be a ...used instrument in furthering trade ...es without a union being able indis... ately to publish falsehoods about persons ...nected with any dispute.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

The Decoration of a Mansion.

...MENT was given by Mr. Pollock on April ...er a hearing begun last term and con... these sittings, of a claim against Mr. ... Mallaby-Deeley, M.P. for the Harrow ...n, brought by Mr. Edward Henry ..., a builder of Harrow-road, W., for the ...y of a balance of 477*l.* for decorative ... done at the defendant's residence, ...m Court, Surrey.

...plaintiff's case was that in pursuance of ...ten contract, dated May 20, 1911, he ...dertaken to carry out certain work at ...m Court; the job was proceeded with, ... complained that before he could finish ...ntract the defendant repudiated it, and ...ated it, ordering the plaintiff to leave ...ce.

... Mallaby-Deeley, on the other hand, ...d the contract, but claimed he was ... under its terms to put an end to it, ...; that the plaintiff's workmanship was ...d that the whole work had been sub... to faulty supervision, and had not been ...o the satisfaction of the defendant's ...t, Mr. Langton Cole, in accordance ...the contract. Mr. Mallaby-Deeley ... to deduct 272*l.* from the plaintiff's ...n regard to the alleged defective work ... additional sum of 54*l.* as damages for ...

...Pollock, in the course of his judgment, ...t the claim was in respect to external ...ernal painting, and papering carried ...his house in August of last year. Alleg... work and delay, Mr. Mallaby-Deeley ...d that he had been entitled to put an ...e contract with the plaintiff, to employ ... else to do the work, and to charge ...ntiff for the amount he had paid, and ...ought to have damages for the delay. ...t point he had to determine was ... in August last year the defendant ...ht in ending the contract. The de... appeared to have made a complaint ...e work, but there had been no com... by Mr. Langton Cole, the architect. ...named had offered evidence in a way ...ould be acceptable in any Court, and ...Marshall and Adams, assistants in Mr. ... Cole's office, had given evidence that ...litions in August were such that in ...inion Mr. Sandon could and would ...n willing to put right all the matters ...ed of by the architect, and that was ... having regard to the fact that the ...s to be done to the satisfaction of the ... under the contract. Mr. Pollock ...d that in these circumstances the ...t was not justified in putting an end ...ntract, and that Mr. Sandon, there... ... entitled to a *quantum meruit* in any ...he work he had done. Regarding the ...of the work, the learned Official ...pointed out that he had inspected it ...t Mitcham Court, and he was satisfied ...ain parts of the external painting ...complaint, and that some reduction ...e made in that respect. As far as ...work was concerned, Mr. Bankes, on ...lon's behalf, had acknowledged that ... it was unsatisfactory. The only ...remaining was as to what sum ought ...ducted from the claim. Allusion had ...de during the proceedings to the *...ardious* affecting this contract from ... Mr. Sandon had complained that he ... obtain possession of the rooms where ... to get the work done, but Mr. Mallaby... ...d said that Mr. Sandon could have ...room he wanted. He (Mr. Pollock) ...inced from the letters between the ...at Mr. Mallaby-Deeley must be in ... this point. The learned Official ...pressed the opinion that the counter... ...d been much exaggerated. He did ...se to go into matters, but he would treat the affair as if he were a jury, as he had been invited by the parties to do. He thought it would be proper to deduct 70*l.* from the plaintiff's claim. There would be judgment for the plaintiff for 207*l.* beyond the 200*l.* paid into Court (which was to be paid out) on the claim, and judgment for the plaintiff on the counterclaim, with the cost of the action.

Mr. Ralph Bankes and Mr. Whateley (instructed by Messrs. Stanley, Evans, & Co.) appeared for the plaintiff, and Mr. Cecil Walsh and Mr. Ralph Thomas (instructed by Messrs. Church, Adams, & Prior) represented the defendant.

KING'S BENCH DIVISION, DIVISIONAL COURT.

(Before the LORD CHIEF JUSTICE and Justices PICKFORD and AVORY.)

London County Council *v.* Jones: When is a Building Dangerous?

THE COURT, on the 25th ult., heard the appeal of the London County Council from a decision of Mr. d'Eyncourt, the stipendiary magistrate sitting at the North London Police-court, under the London Building Act, 1894. The respondents to the appeal were Messrs. Matthew Jones & Son, the owners of property at 52 and 54, Queensland-road, Islington, but they were not represented.

Mr. Bodkin, appearing for the London County Council, said the case raised the question as to the true meaning of the word "dangerous" as applied to buildings. It appeared that the respondents were the owners of two houses which were derelict and in a ruinous condition. A notice was served upon them to make certain structural alterations, the allegation being that the buildings were in a dangerous condition. Following the receipt of the Surveyor's report to that effect, the Council shored up the buildings, and as the owners did not obey the notice a summons was issued against them, and that came before the magistrate at the North London Police-court. At the hearing it was admitted that the buildings were not at the moment dangerous, because they had been shored up, and even before that there was no danger to the public, because the houses were not inhabited, while if they fell down no harm could ensue because they were fronted by land, and there was a space between the houses and the pavement. It was submitted for the appellants that it was immaterial whether the houses were inhabited or not, or whether the structures stood back from the street and they were dangerous, even though they had been temporarily shored up. The magistrate was of opinion that the premises were not dangerous, although in a ruinous condition, and no person except a trespasser would receive injury from their collapse. Therefore, they did not come within sect. 115 of the Act, and he dismissed the summons.

Mr. Justice Avory: Is a ruinous structure always dangerous? I see that the magistrate says the buildings were ruinous.

Mr. Bodkin said he would argue that a ruinous building was dangerous providing that it was anywhere near a place where the public had access.

The Lord Chief Justice: What was the Surveyor's report?

Mr. Bodkin: That the buildings were dangerous, and would collapse if not shored up.

His Lordship: I can't see that because the Council had temporarily shored them up it could be said that they were not dangerous.

Mr. Bodkin said the buildings were dangerous even if when they fell they injured only water-pipes, drainage, and gas-pipes.

Mr. Justice Pickford: There must be a possibility of the houses doing damage to somebody or something. Of course, it would not be sufficient to say that the buildings were dangerous if they were tumbling down in an out-of-the-way place.

Mr. Bodkin said that what seemed chiefly to influence the magistrate's mind was that the premises had been shored up by the Council, and were, therefore, although in a ruinous condition, at present not dangerous.

The Lord Chief Justice: Can the Council recover the cost of shoring?

Counsel: Yes.

The Lord Chief Justice, delivering his judgment, said, to his mind neither of the magistrate's grounds for dismissing the summons was sufficient. The County Council had power to shore up the buildings for the safety of the public, but it could not be said that because they had done that the buildings were no longer dangerous. They must have been in a dangerous condition to warrant the Surveyor reporting the matter and the Council shoring them up. A point had been made that the houses were in a ruinous condition and deserted, but he saw nothing in the Act which said that a ruinous house was not dangerous. He would not express any opinion as to the degree of danger, but he certainly was not prepared to agree with any argument to the effect that because a building stood away from the road and was not inhabited, it was not dangerous. The case would have to go back to the magistrate to convict.

Mr. Justice Pickford, concurring, said the fact that the danger had been for the moment averted by the temporary shoring up could not be put forward as an argument that a house was not dangerous. Of course, every house which was likely to tumble down was not dangerous, but as the houses in question formed part of a row, it seemed impossible to say that the prospect of their collapse did not afford anxiety to somebody.

Mr. Justice Avory agreed, and the appeal was allowed, and the case sent back to the magistrate.

CHANCERY DIVISION.

(Before Mr. Justice SWINFEN EADY.)

Account of Wages under Workmen's Compensation Act Policies: Motion to Attach Builders.

The Sun Assurance Company, Ltd. *v.* C. Bushby & Sons.

HIS LORDSHIP heard this case on Friday, April 26. It came before the Court upon a motion by the plaintiffs to attach Mr. G. H. Bushby and Mr. W. Bushby, the two partners of the firm who had been served with the notice of motion. The third partner, Mr. Alfred Bushby, was ill, and the plaintiffs had not, therefore, served him.

Mr. Strode, for the plaintiffs, said the ground of the application was that the defendants had not complied with an order to leave in chambers certain accounts, verified by affidavit, showing the amount of wages paid by the firm of Messrs. C. Bushby & Sons, builders and contractors of Leeds, to their employees under the conditions in policies under the Workmen's Compensation Act, issued by the plaintiffs to the defendants. The latter did not appear by Counsel, but Mr. G. H. Bushby appeared in person.

His Lordship (to Mr. Bushby): Why have you not lodged an account of wages? Mr. Bushby replied that he had made an affidavit giving the total amount of wages paid.

Mr. Strode: I have seen that, and it is not a compliance with the order at all. Counsel said that the order under which he was proceeding was made by Mr. Justice Neville on March 12 last, and by it the defendants were directed to lodge with the Registrar within four days an account of all wages, salaries, and other payments paid by the defendants to their employees insured under certain policies with the plaintiff company. The original order in the action declared that the plaintiffs were bound to keep a proper wages book, which should be open to the inspection of the plaintiffs. There were three policies altogether, and the period covered by them was from April 7, 1909, to June 29, 1911.

Mr. G. H. Bushby then read an affidavit of April 20, sworn five days after the issue of the motion to attach, from which it appeared that the amount paid in wages for the contracts and during the period covered by the policies was 3,775*l.* 10s. 11d.

Mr. Strode submitted that the account was not properly verified, nor were the amounts sufficiently identified. The plaintiffs ought to know the number and nature of the employees. He had not been able to see any pay-sheets.

His Lordship said he thought most of the details necessary were in the affidavits. To the defendant: Where did you get the figures to make up the account?

Mr. Bushby said he got them from the pay-sheets.

His Lordship, after examining some of the pay-sheets, said he thought they would give Mr. Strode all the material he wanted. The defendants ought, of course, to have produced those details before.

Mr. Bushby: We thought we had done everything necessary when we produced the books.

His Lordship: I will make no order on the motion except that the defendants pay the costs of it.

CHURCH OF THE HOLY SPIRIT, CLAPHAM-COMMON.

The foundation stone of the Canon Greene Memorial Church, Clapham-common, was laid on April 27. The architect is Mr. H. P. Burke Downing, F.R.I.B.A., and the builders are Messrs. Allen Fairhead & Son, Enfield. The church was illustrated in the *Builder*, August 13, 1910, and May 12, 1911.

LONDON COUNCILS.

Bethnal Green.—The Medical Officer of Health for the Borough, winding up his report to the London County Council on the sanitary condition of a small part in the Borough known as the Brady-street area, states that he is convinced that nothing short of an improvement scheme for the entire reconstruction, will widen any of the narrow streets or abolish the blind alley slums in the area.

East Ham.—An underground convenience is to be constructed on the Barking-road frontage of the Town Hall site at an estimated cost of 500*l.* A plan has been passed for Mr. F. Smith for extensions at the "Coach and Horses" public-house, Romford-road.

Greenwich.—Nine roads in the Borough are to be repaired at an estimated cost of 4,386*l.* Plans have been passed for Mr. W. J. Maddison for extensions at the Greenwich Inlaid Linoleum Company's Works, River Bank; also for Mr. F. Gardiner for building Nos. 179 and 181, Eastcombe-avenue.

Heston and Isleworth.—The following plans have been lodged:—Messrs. Norfolk & Prior, picture theatre and two shops, Staines-road, Hounslow; Mr. E. T. Swinson, additions at Wesleyan Church, Hounslow; Messrs. P. Chase, Gardener, & Co., cinematograph theatre, Staines-road, Hounslow; also bungalow, Hanworth-road, Hounslow, and house, Thornbury-road, Spring-grove; Messrs. Taperall & Haasse, picture palace and shops, Neal's-corner, Hounslow.

Holborn.—A 15-in. stoneware pipe-sewer is to be laid in lieu of the brick sewer in Princeton-street. The tender of Messrs. John Mowlem & Co., Ltd., has been accepted for repaving a portion of the carriageway of High Holborn with fine-squared granite setts at 13s. 4d. per yard super.

Lambeth.—Repairs are to be carried out to the wood-paved carriageway of Railton-road at an estimated cost of 700*l.* Plans have been passed for Messrs. Hulbert & Haysman, on behalf of Mr. G. Roskilly, to drain three shops proposed to be erected in Lansdowne-road. The following plans have been lodged with the London County Council:—Messrs. J. A. J. Woodward & Sons, on behalf of Messrs. Dennis & Ryland, buildings, Dolland-street; Mr. G. C. Miller, on behalf of the London and South Western Bank, Ltd., buildings upon the site of Nos. 335-7, Norwood-road; Mr. G. Bartlett, on behalf of the Duchy of Cornwall, buildings on site of Nos. 38-56, Upper Kenning-ton-lane; Messrs. J. A. J. Woodward & Sons on behalf of Mr. James Wilson, additions to Nos. 2 and 4, Jonathan-street, Vauxhall.

Poplar.—The tender of Messrs. William Johnson & Co., Ltd., at 7,530*l.*, has been accepted, in lieu of that of Messrs. Thomas & Edge, for erecting and completing the superstructure of the extension to the generating-station. The sub contractors for the steelwork are Messrs. Fairweather & Ranger. Plans have been passed for Messrs. J. T. Bressey & Son for additions to the factory of Messrs. Watts, Ltd., in Kelday-road.

Staines.—Plans have been passed for Messrs. Belfrage & Saville for four houses in St. Hilda-avenue, Ashford.

Stepney.—Plans have been passed for additions to the biscuit factory, Nos. 160 and 161, High-street, Shadwell, of Messrs. Meredith & Drew, Ltd. Plans have been lodged with the London County Council by Mr. J. Catley for the erection of additions to the Alexandra Wing of the London Hospital, Whitechapel-road; also by Mr. A. J. Roddis for a cinematograph hall in Chicksand-street.

Walthamstow.—It has been decided by the Committee in charge of the matter to apply to the Local Government Board for authority to prepare a town-planning scheme. Tenders are to be invited for doubling the tramway track at Bell-junction. Plans have been passed for Mr. E. Barltrop for eleven houses in Aveling Park-road, also for Mr. A. G. Barton for a warehouse in Hale End-road. Mr. J. E. Ashby has lodged plans for a foundry, etc., in Blackhorse-lane.

OBITUARY.

Sir John Taylor, K.C.B.

We have to announce, with regret, that Sir John Taylor, K.C.B., F.R.I.B.A., died at Surbiton Hill on the 1st inst. His long association with the Office of Works made him a well-known figure in official and architectural circles, and some notes of his career will be given in our next issue.

Professor O. Seitz.

The death, in Munich, is announced of Herr Otto Seitz, aged sixty-five years, Professor at the Munich Academy, landscape painter, and a pupil of Piloty.

Mr. J. J. Bradshaw.

We regret to announce the death of Mr. Jonas James Bradshaw, of the firm of Messrs. Bradshaw & Gass, latterly Messrs. Bradshaw, Gass, & Hope, of Bolton and London. Mr. Bradshaw was elected a Fellow of the Royal Institute of British Architects in 1886. The following works of the firm have been illustrated in the *Builder*:—Manchester Stock Exchange, with offices, in a limited competition (July 9, 1904, and September 21, 1907), erected at a cost of over 35,000*l.*, after the Renaissance manner; Carnegie Library, Stockport, in competition (November 5, 1910); Manchester Library and Art Gallery, with Mr. A. J. Hope, submitted by them as one of the ten nominated for the competition (December 15, 1911); and the Lancashire and Cheshire Miners' Federation Hall, Bolton, with Mr. A. J. Hope, in competition (April 19, 1912). Messrs. Bradshaw & Gass were the architects of—in Bolton—the Claremont Baptist Schools and clubrooms, Bark-street; pupil teachers' centre in Hilden-street for the Corporation; Wesleyan Church at Haulgh; King's Hall Wesleyan Mission and the Bromley Art Gallery at Bradshawgate; extensive alterations of St. George's Church, with Mr. Hope (1903); Astley Bridge, and Great Lever Branch Libraries; Church Schools, Astley Bridge; Girls' High School; Girls' Club, Kensington-street; Wesleyan Chapel, Cawdor-street; Wesleyan Schools, Radcliffe; Central Stores, Bridget-street; Co-operative Society's premises; Victoria Central Wesleyan Mission Hall; Thomasson Reading Rooms; offices, workshops, and tramway service buildings, for the Corporation, at Bradshawgate; and Wesleyan Church buildings, Castle-street. In Liverpool:—The Charles Garrett (Wesleyan) Mission Central Hall, Renshaw-street, 45,000*l.*, the site excepted (1904). In Manchester:—Zion Institutional Church (in limited competition), 1908; Congregational Church House, Deansgate, in limited competition (1910). In Wigan: Queen's (Wesleyan) Mission Hall, with two halls for 2,800 seats, shops, and offices (1908). In London:—The Leysian Mission, Queen Victoria Hall, City-road, with two halls, for 2,600 seats, twenty-three classrooms, clubrooms, and residential quarters, to cost an estimated total of 108,000*l.*, of which the first completed portion was opened by the then Prince and Princess of Wales on July 11, 1904; and the Tollard Hotel and the Royal London Friendly Society's buildings in Southampton-row, W.C. They were also the architects of Westhoughton District Council Offices; of a large number of mill premises, offices, etc., at Leigh, Eagley, Atherton (with the Free Library), Deane, Horwich, and around; houses at Lowton, Waterfoot, Heaton, Horwich, Darwen, Rugby, Windermere, and many other localities; and, in competition, 1910, of the premises in Albion-street, of the Leeds Industrial Co-operative Society; of the Queen's Theatre, 2,000 seats, 1901, and Baptist Church and Schools, Farnworth; and Fishpool Workhouse, with nurses' home (1896-9).

Mr. R. J. Macbeth.

The death is announced of Mr. Robert John Macbeth, of Queen's House, Inverness, N.B. Mr. Macbeth was elected a Fellow of the Royal Institute of British Architects in 1906. In last February he was nominated, with five other architects, to compete for the Scots National Memorial to King Edward VII., to be erected at Holyrood Palace. Mr. Macbeth was the architect of—in Inverness—the Science and Art Schools, at a cost of about 8,000*l.*; police-station and chambers, and the new halls for the United Free High Church, Bank-street; the United Free Churches, with their manses in Brora, Kirkhill, and Dornoch; restoration of the United Free Church, with hall, etc., Forres; schools at Culburnie and Portree; the public schools at Glenconnith and Tomnacross; the church buildings, Rosehall, Sutherlandshire; and residences and other buildings in Strathcarron, Forres, Portree, etc. Messrs. Ross & Macbeth prepared the plans and designs for the Seaforth Sanatorium at Dingwall, built and endowed by Colonel and Mrs. Stewart-Mackenzie of Seaforth (1907): St. Kessog's Church, Auchterarder, planned for all forms of Christian worship; and the new church, for 900 sittings, at Auchterarder (1905-7); Free Church, Struy; extensive additions to Skibo Castle, for Mr. Andrew Carnegie, at a cost of some 25,000*l.*, in 1899-1901; additions to the Orphanage, Aberlour, and Cluny Hill Hydro, Forres (1905-7); Caledonian Bank, Buckie; church for Mr. Dyson Perrins, at Ardross Castle, for 400 sittings; Aviemore Hotel, Inverness-shire, at a cost of 18,000*l.*; Woodward memorial reredos, St. Mary's Church, Montrose; Cumming-street Church, Forres (1899-1901); and—in Inverness—the Lord Tweedmouth memorial chapel, and the nurses' home, Northern Infirmary; the Free Presbyterian Church, 700 sittings; the new music-hall (1899); the enlargement and improvement of Northern Counties District Asylum, at a outlay of about 31,000*l.*; of the Station H and of the old Free East Church (1897-8).

FOREIGN AND COLONIAL

Building, etc., Works, South Africa.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anouymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

PRICES CURRENT OF MATERIALS.

*** Our aim in this list is to give, *as far as possible*, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

THE NEW ADELPHI HOTEL, LIVERPOOL.
MR. R. FRANK ATKINSON, F.R.I.B.A., ARCHITECT.

Design for Marylebone Municipal Buildings.

By Messrs. Lucas, Lodge, & Farey.

(Royal Academy Exhibition, 1912.)

CONTEMPORARY ARCHITECTURE AT THE ARCHITECTURAL ASSOCIATION.

WITH that enterprise and freshness of outlook which should naturally characterise the or professional society the Architural Association has broken fresh nd with an exhibition of contemry work on lines which, if previously cated, have not often, we think, put into practice before.

e novelty and special interest of this bition is that, instead of consisting tow drawings specially prepared by cts in the art of pictorial representaor misrepresentation of architecture, confined to actual working drawings, y ¼ in., and photographs showing nished work in execution.

art from the interest and value of able to compare the working details with the effect they are designed to produce, the exhibition does bring home to us the advantage of the photograph as a means of producing within the limits of the medium a truthful representation of executed work, and coming as this exhibition does simultaneously with the opening of the Academy it inevitably suggests a comparison unfavourable to the latter in this respect.

Three or four small views of a house and its actual surroundings, all on the same mount, with a plan below, certainly seem to give a better idea of the actual result produced than the most effective of show perspectives with surroundings that are generally "composed" to make a picture.

The only thing lacking is colour. If the designer could make an accurate and realistic colour drawing or painting of the actual effect of his building when executed he might be able to give a more complete effect than can be obtained by photography. He might even be able to express in his drawing something more of his own personality or some aspect of his original idea which he had failed to entirely realise in his building. When, however, perspectives, as is too often the case, are done by other people who do not trouble to make studies of the actual building itself, and have possibly never seen it, those advantages are not usually obtained.

The proper use of perspectives is surely for purposes of study or to give a conventional suggestion to others of the effect of a design not yet carried out.

It is a constant source of complaint that architects have so few opportunities to see one another's work. In one way, of course, this is inevitable. Even though they may live and design in close touch with one another, their actual work is scattered about the country in all directions, and few of their colleagues ever see it unless it happens to be in London or in one of the large provincial cities. Particularly is this the case with the designers of country houses, whose best work may be buried in the wilderness.

In such cases an architect depends for the recognition and appreciation of his colleagues almost entirely upon the illustration of his work, and the curious fact may be noticed that many have gained high and no doubt well-deserved reputations, although their actual work may never have been seen by one in ten, perhaps not one in a hundred, of those who applaud it. It seems advisable, therefore, from every point of view that illustrations of executed work should be as accurate as possible, and in this respect there can be no question that the photographs and working drawings at the Association are preferable to the perspectives and show drawings at the Academy.

Although the professional journals fulfil a recognised function in endeavouring to keep the members of the profession in touch with one another's designs, there is plenty of scope for more to be done in this direction, and it appears to us that now the Institute possesses suitable galleries there is no reason why it should not follow the lead of the Association and hold exhibitions of a technical and intimate nature which really explain the works exhibited.

Exhibitions for this purpose need not clash with those at the Association, which, being organised for the benefit of the students, should naturally contain special features not applicable to exhibitions at the Institute.

THE ROYAL ACADEMY EXHIBITION: DOMESTIC WORK.

THE amount of domestic work shown is perhaps slightly smaller this year than usual—at least that is our unverified impression; though what diminution there may be is more probably due to the very imperative demands of other sections rather than to any falling off in the number of designs sent in. In the welter of "nice" and even interesting works submitted, and in the face of irrepressibly varied methods of rendering adopted, the hangers' task must be unenviable indeed. There can be often so "little to choose" between one impeccably symmetrical Georgian façade and another, and of the many little houses, more fitting, one would think, most of them to the water-colour room. Who, not knowing the conditions surrounding each, is to say which of them is the more worthy? Who is to say, indeed, that there are any "conditions"—that the designs, that is to say, are, or ever will be, built? And one wonders that the hanger does not concentrate exclusively on men of well-known names, to whom admission to "Varnishing Day" is an incident in the course of practice, rather an end in itself; for this might easily be done, and no imputation be cast, in a collection which numbers altogether under three-score of exhibitors. Amongst them no great advance and no very remarkable coherence of tendency can be discerned, so that we can but comment upon several as briefly as may be. Mr. Reginald Blomfield, A.R.A., shows two large houses, one (1581) in Norfolk, of the early Georgian style, of the kind with which we have learned to associate his name, which will probably look better in execution than it does as a drawing—in this case a large and hurried one in pencil, looking exceedingly weak. His other (1627) is a house in Jersey, which, we happen to know, is an adaptation of an old building. The drawing shows more forecourt and tree than house (though it is not the worst offender in this respect) and looks as though it ought to belong to a collection of curious mezzotints. Mr. Walter H. Brierley's "Sion Hill" (1612) shows what may be done by ranging round a forecourt in the manner of some old groups of almshouses, with plain, straightforward work. It is shown in a strong realistic water-colour. Mr. F. L. Chesterton has a pleasant little drawing (1616) of a Georgian façade with excellently-drawn and most picturesque gate-piers and wall in the foreground. The legend tells us that it is "alterations" only, and we wonder how much and what is due to Mr. Chesterton. 1596, a house at Leek Wootton, is a very slick water-colour of a kind well adapted to showing Mr. H. B. Creswell's ashlar and clear-cut detail. Mr. Horace Farquharson shows a very low, comfortable-looking house (1621) with a very early-Victorian aspect. We wonder again how much of the house is new. The lower story is covered with green trellis for plants—which looks very well, but would it not be damp? Messrs. Horace Field, Simmons, & A. Faulkner (1587) send elevations of a large and frankly suburban residence in red brick. It looks more suburban—more as though it were in some avenue of such—by reason of the two elevations being placed side by side as though they were to be built so. The design is somehow restless, perhaps because of over-emphasised quoins, keys, and arches, and the club-headed chimney-stacks. 1592, a garden swimming pool, is a pleasant arrangement by Mr. Oliver Hill. 1599, shows a house at Worplesdon, by Mr. Leonard Martin, of considerable size, which is plain and straightforward, and yet legitimately picturesque by virtue of its arrangement. 1598, by Sir Ernest George & Mr. A. B. Yeates, is a wood-frame house, with a brick basement story, in British Guiana. It is not remarkable, though pleasant; but surely it would gain æsthetically and practically by immensely wider eaves? Mr. Brantwood Maufe has an ink drawing (1636) of a large house on an angular plan, which seems to work very well (the plan is given). But the walls are treated with rough-cast or plaster with horizontal courses and perpendicular streaks of brick cropping through, the reason for which, structural or æsthetic, eludes us. The quality of Mr. Ernest Newton's work can hardly be grasped for the excee cleverness of his draughtsman. A hc which on one small drawing shows and long, is shown in part on ano large one, looking high and almost he The detail illustrates sound and work with all its author's qua Mr. George Nott shows a large and st drawing of a house (1613) the siz which may be gauged variously from figures by the door and the wind which appear small for a house of size, the house itself seeming sm than on a first impression, if one l into it. But the whole should, we th be distinctly pleasing in actuality. a good example of sound modern de which avoids any apeing of past st and, if one excepts some blue-b "spot decoration," avoids also the m tricks and vagaries apparently incide to their abandonment. The colou if one is to take it as realistic, show appreciation of sober brown brickw Mr. Goodhart Rendel (1604) has interesting essay in the combinatio two colours of stone, a red-brown for dressed stone with grey rubble in betw He attempts windows of perhaps gre width in proportion to height than be done happily in traditional mate Also the doorway is distinctly w But this little house affords gre promise of successful work in the fu than almost anything shown. Mr. D Richter exhibits one of his clev coloured, if somewhat heavy inte (1602). Mr. A. Winter Rose's dra shows well and prettily the atmosp and feeling we may suppose him to at in his work, but little of the linear reality which allows us to j for ourselves. "Atmosphere" and fe are well enough and properly attrib of a picture. But actual building st unfortunately, by being new. And weather is so changeable. Oh, ha architects, could the sun but shine alv and from a constant quarter!

Mr. Andrew N. Prentice shows on two characteristic examples. Mr. D Spain (1583) exhibits a small hous Harpenden, which is an attempt t a monumental scale within a s compass; so that the house look though it were related closely much bigger house. Perhaps i We hope that Mr. Spain will be showing us some more impor work which will be worthy of the we of this heavy detail. 1641, Port Alls, Cornwall, by Mr. Philip A. Tilde interesting and really well drawn in and-ink. There is very little of whic feel justified in saying positively th should not have been admitted. perhaps, a suburban house; but this, poor and hopelessly out-m "half-timber" work though it be, claim a right, as apparently does so m else, on the ground that the R Academy is almost officially boun represent as fairly as it may the av level of artistic ability. All stric on the Royal Academy itself mus qualified by this reflection.

PROFESSOR OF CIVIC DESIGN, LIVERPOO

Professor A. D. Adshead, F.R.I.B.A., ha appointed to the new chair of Civic Des the University of Liverpool. He was Associate Professor of Civic Design in M 1909.

NOTES.

Regent's Quadrant Competition.

It has been obvious to those who have studied the proposed rearrangement of Piccadilly-circus d the designs for the new Regent's adrant that the business with a cial claim to consideration is that ned by Messrs. Swan & Edgar, Ltd. r can we be astonished that this firm, common with similar establishments pending largely on the display of ds, object to the proportion of masonry luded in Mr. Norman Shaw's scheme. e are, therefore, not surprised to receive following communication from ssrs. Swan & Edgar, and we desire to w the attention of competitors to the tifying intimation that the firm are pared to take an active interest in the npetition :—

Sir,—Your competition for what is practic- r a rebuilding of our premises appeals to as likely to be extremely useful in offering tance for the solution of this difficult problem. should like to indicate our approbation of proposal in some practical way, and have ided that in the event of a thoroughly able design for our purposes being obtained, roved by us and adopted, we will offer author some recognition of his ability, er by way of additional premium, or, if ecomes practicable, a professional position ch will enable him to put his design in erial form, our principal requirements being d light to all floors and suitable shop dows.—Yours faithfully,

For Swan & Edgar, Ltd.,
Walter Morford,
Managing Director."

are sure that all who have entered for competition will feel the stimulus his unsolicited expression of the views ne of the firms chiefly concerned.

e Prevention Vandalism.

We are glad to notice that a meeting, presided over by the Bishop of ichester, has been held at Farnham tle in order to form a Society for the servation of the beauty and historic ures of the town, and to control the hetic aspect of any future develop- nts. The Dean of Wells, in support the proposal, drew attention to the essity of such societies in every town England, and to the difficulties that et civic authorities for lack of proper lic support. There is no doubt that, adly speaking, the authorities of a n have only too good reason for eving that they occupy their position rder, first and foremost, to look after material interests of its inhabitants. that any activities outside that rather ricted sphere of usefulness are likely neet with condemnation. It is very essary, therefore, to be able to show n that every town has a large propor- of its inhabitants who are willing to port all reasonable proposals for its rtification, and indeed consider this ne of the rightful functions of its civic norities. To this end such societies his may contribute much, and we e to see them established through the th and breadth of the land.

otection of onuments.

With reference to our article on the discussion in the House of Lords of the for the further protection of ancient uments, a correspondent draws our ntion to the fact that there are two Bills. On referring to that put forward by Lord Eversley we find that "this Act shall not apply to any structure which is occupied as a dwelling-place by any person other than a person employed as a caretaker thereof and his family." This seems to make it quite clear that the Act cannot be evaded simply by putting a caretaker into an otherwise uninhabited house; but, all the same, there does seem to be a possibility of withdrawing buildings from the protection of this Act by the simple process of letting them, so that when inhabited the owner can deal with them as he pleases. We hope this point will not be overlooked.

Mural Decoration.

Dr. Randall Davidson, in responding for the "Guests" at the Royal Academy Banquet, did not fail to impart to his speech the fitness of expression and sympathy with artistic ideals associated with the highest ecclesiastical traditions. His plea for mural decoration should serve as an exhortation not only to those able to employ the "cohort of artists inferior to no previous generation," but to the artists themselves. The speech should be taken to heart, especially by those who are competing for the numerous prizes offered by the Committee at Crosby Hall for various decorative projects. Painters should be stimulated by the Archbishop's references to artistic possibilities in connexion with secular and other buildings. With definite proof of the existence of a budding Puvis or a XXth-century Watts, it should not be long before "the drab walls, the long purse, the skilled pencil and brush" are brought together for public and private benefit. Could not the Royal Academy itself make use of Lord Leighton's bequest of 10,000*l.* to give effect to the Primate's vision?

Street Name-Plates.

Following a recommendation of the Art Committee, the Council of the Royal Institute of British Architects have invited local authorities to a Conference proposed to be held on May 22, at 9, Conduit-street, to discuss the possibility of providing uniform name-plates at street corners in London thoroughfares. Although but a minor civic matter, it is one which claims attention. For our own part, we do not value uniformity so highly as legibility by day and night; but if a standard size and style can be agreed upon, and if the lettering suggested is both clear and artistic, the scheme will be worthy of support. There should be no difficulty in devising a system of direction with both useful and decorative qualities.

Danish Art at Brighton.

This, the third in a series of exhibitions dealing with the work of Continental schools, was recently opened at the Corporation Art Galleries. Though perhaps not quite so strong as the Swedish Exhibition last year, it is decidedly interesting, few of the artists having exhibited work in this country before. The portraiture, both in painting and sculpture, is strong and individual, and there is also to be seen a good collection of Copenhagen porcelain, including a case of figures, of small size and delicately coloured, illustrating the life and costume of the country, which is specially worthy of notice. The exhibition remains open until July.

Hospital Criticism.

In commenting on our article on Sir Henry Burdett's criticism on Sheffield Royal Hospital our contemporary, the *Hospital*, appears to miss the point of our observations. Whether the Report of the Investigation Committee is right or not, and whether this hospital is well designed or not, we should still hold that "a layman's opinion can hardly be accepted as the last word on hospital construction." It is not necessary to remind us that the object of Sir Henry Burdett's inspection of hospitals has been to help to raise the standard of efficiency. It is just because we realise the importance of such work that we regret its value should be discounted by statements reflecting on hospital designers, which do not appear to be in accordance with the facts, and which so far as we are aware have been neither substantiated nor withdrawn.

ANNUAL REPORT.

The annual general meeting of the Royal Institute of British Architects was held on Monday, when the annual Report was received and adopted. We take the following information from the Report:—

The Coronation.—On the occasion of his Majesty's Coronation the Council presented a loyal address, designed by Mr. Grailly Hewitt, on behalf of the members of the Royal Institute, and a scheme of decoration for the premises was prepared by the Hon. Secretary, Mr. Henry T. Hare.

Obituary.—The losses by death have been as follows:—Hon. Fellow. Sir Francis Sharp Powell, Bart.; Fellows: Henry Bloomfield Bare, Franc Sadleir Brereton, William Glover, Alexander Graham, William Henry Hill, George Gordon Hoskins, Francis William Humphreys, Robert John Macbeth, Duncan McNaughtan, Dr. John Samuel Phené, James Pigott Pritchett, George Ransome, William Forrest Salmon, Charles Smith; Retired Fellows: Frederick William Albury, Elijah Hoole, James Radford; Hon. Associate, Edwin Austin Abbey, R.A.; Associates: Sydney Bridges, John Codd, William King Lucas, John Bevan Phillips, William C. Poole, Thomas Miller Rickman, Henry Shackleton; Licentiates: John Davidson, Harry Edward East, Gascoigne Hastings, Fowler-Jones, William Pickels, Edward Ashby Smith, Wilfrid Travers Wire; Honorary Corresponding Members: Fernand de Dartein, Pierre Jérome Honoré Daumet, Alexander von Wielemans.

Royal Gold Medal.—The Royal Gold Medal was awarded last year to Dr. Wilhelm Dörpfeld, F.S.A., in recognition of his eminent services to architecture through his archæological researches. Greatly to the regret of the Council, a serious illness made it impossible for Dr. Dörpfeld to receive the medal in person

at the meeting on June 26, 1911. It has been decided to award the medal this year to Mr. Basil Champneys, F.S.A., in recognition of the distinguished merit of his executed work in architecture. His Majesty the King has graciously signified his approval of the award, and the medal will be presented to Mr. Champneys at the general meeting on June 24.

Membership.—The following tabular statement shows the present subscribing membership of the Royal Institute compared with corresponding periods of 1909, 1910, and 1911 :—

Year.	Fellows.	Associates.	Hon. Associates.	Total.
1909	888	1,344	46	2,278
1910	874	1,451	48	2,353
1911	862	1,509	55	2,426
1912	859	1,581	54	2,496

During the official year since the last annual general meeting thirteen Fellows have been elected, 108 Associates, and two Honorary Associates. The Council have decided to consider the situation which arises from these figures.

Licentiates.—The period for the election of Licentiates having been extended to the end of June, 1912, applications have come in freely during the whole year, and at the present moment a total of 1,834 Licentiates have been elected, and many other applications are under consideration.

New Allied Societies.—Since the publication of the last annual report the Council have had the pleasure of admitting the Northamptonshire Association of Architects into alliance with the Royal Institute.

Registration.—In the last annual report the Council outlined the steps that had been taken to secure united action by the Royal Institute and the Society of Architects in advancing the policy of Registration. Legal and constitutional difficulties made it necessary to lay before the members a proposal to obtain the Privy Council's sanction for a Supplemental Charter and by-laws conferring the necessary powers on the Royal Institute. The Council's proposals for this purpose were laid before a special general meeting on January 8, 1912, and an amendment was carried referring them back to the Council for further consideration. The Council at once appointed a strong and representative Registration Committee to consider and report upon the question, and this Committee is now actively at work under the Chairmanship of Mr. John Slater.

Architectural Copyright.—In the new Copyright Act, 1911, the privileges of artistic copyright are for the first time extended to works of architecture.

Board of Professional Defence.—The Board have held a number of meetings, and have given advice to members in questions of a legal nature. They have given attention to several recent judicial decisions which have appeared to enlarge the legal responsibilities of architects, and the possibility of safeguarding the profession against hitherto unforeseen dangers is being carefully considered.

Professional Conduct. — The Professional Questions Committee have considered a number of cases referred to them from time to time, and have advised the Council upon them. The Council are now considering the advisability of drawing up and publishing a Code of Professional Ethics for the guidance of members.

The Membership Diploma.—A Sub-Committee of the Council is engaged in the preparation of a design for a new membership diploma, to take the place of the old membership certificate, under the terms of the Supplemental Charter of 1909.

The Schedule of Charges.—The Council have been engaged for some time upon the revision of the schedule of charges. The Councils of the allied societies in the United Kingdom have been consulted in the matter, and it is hoped that the draft will be ready for submission to the general body at an early date.

The Town Planning Committee.—During the past year this Committee has been in communication with the allied societies with the object of bringing architectural opinion to bear on the town-planning schemes that are being prepared throughout the country. It has already prepared and published a pamphlet for the guidance of promoters of such schemes.

The International Congress, Rome, 1911.—The ninth International Congress of Architects took place at Rome between October 2 and 10. The British visitors numbered sixty-six out of a total attendance of some 500, and the Royal Institute was represented by its President, Mr. Leonard A. Stokes, Mr. John Belcher, R.A., Past-President, and Mr. John W. Simpson, Vice-President, and Secretary of the Comité Permanent. The British Government was represented by Sir Henry Tanner, C.B., I.S.O. [*F.*], and Mr. W. E. Riley [*F.*] represented the London County Council.

Henry Jarvis Bequest.—This bequest is now in the hands of the residuary trustees, and the Council have advised them, under the terms of the will, to apply the available income to the foundation of Jarvis Studentships at the New School at Rome. If the Council's proposals are accepted there will be an annual examination for the studentship, which will be open to all students and Associates of the Royal Institute of British Architects under the age of thirty years, and one studentship will be awarded every year, of an annual value of about 180*l.* and tenable for two years.

Finance.—The auditors have framed th report in such a form as to give the membe an independent statement of the gene financial position of the Royal Institute. T attention of members is particularly direct to this report.

Examinations.—The Progressive Examin tions were held in June and November, 191 The Preliminary was held in London, Brist Leeds, Manchester, and Newcastle-on-Tyn the Intermediate in London, Bristol, Lee Manchester, and Newcastle-on-Tyne. T Final and Special Examinations were he in London, and the Special Examination f Colonial candidates in Johannesburg, Sydne and Toronto. The Council desire to reco their thanks for the valuable services render by the Hon. Secretaries and Examinati Committees of the various allied societi The results are shown in the following tabulat form :—

	Admitted.	Exempted.	Examined.	Passed.	Relegated
Preliminary Examination	241	81	160	123	37
Intermediate Examination	242	15	227	120	107
Final and Special Examinations	235	—	235	115	120

The New British School at Rome.—During the Presidency of Sir Ernest George the Council gave much consideration to the possibility of founding a British School of Architecture at Rome. A Special Committee was formed to consider the project, and had entered into negotiations with the authorities of the existing British School at Rome. The Council therefore welcomed the intervention of the Commissioners of the Exhibition of 1851, who came forward at a critical moment and, with the assistance of the Royal Institute, the Royal Academy, the Royal Society of Sculptors, and the British School at Rome, founded and endowed a new and enlarged School of Painting, Architecture, Sculpture, and Archæology, which will soon begin its work. The Royal Institute of British Architects is represented on the Council of the new School by Mr. Reginald Blomfield and Mr. John W. Simpson. At the request of the Commissioners the Council have prepared a scheme for the examination of the candidates for the Architectural Scholarship which will be awarded every year by the Commissioners, and it is intended that the holders of the proposed Jarvis Studentship should also be in residence at the new School for a period of two years each

New London Bridges.—In the last annual report the Council referred to the efforts they were then making to induce the Corporation of the City of London to consider the question of the proposed St. Paul's Bridge from an architectural point of view. The action of the Council was largely instrumental in leading the House of Commons to defer the passing of the Bill until the scheme had been considered and reported upon by a specially-appointed Committee of architects, consisting of three members of the Royal Institute—Sir William Emerson, Mr. T. E. Collcutt, and Dr. J. J. Burnet. The Council have also been in communication with the London County Council with reference to the new Lambeth Bridge, and have urged the importance of treating the design of the bridge from the outset as an architectural problem of great importance to London.

The Joint Committee on Reinforced Concrete.—This Committee has compiled and published, with the sanction of the Council, a second report on reinforced concrete. It has also considered the London County Council's draft regulations for reinforced concrete construction, and has reported upon them to the Council, who have submitted various criticisms and suggestions to the Local Government Board, whose sanction is required for these regulations.

Competitions.—The Competitions Committ have had under their consideration the co ditions issued by various promoters, and cases where the conditions have been unsat factory the promoters have been communicat with and urged to modify them. In the ca of the competitions for the Australian Fede Capital, Oakwood Avenue Council Scho Warrington, and Blackwood Hall, the Co mittee's efforts to obtain satisfactory amen ment of the conditions having been unavailin the Council by publication in the *Journal* a in the professional Press have warned membe and Licentiates not to take part in them.

The following have been the Presiden nominations to assessorships during the offic year :—

Cardiff	Technical Institute	Mr. James S. Gibson.
Cardiff	New Fire Brigade Station	Mr. A. Marshall Mackenzie.
Dovercourt	School	Mr. Paul Waterhouse.
East Sussex	New Hospital	Mr. Edwin T. Hall.
Felixstowe	Church	Mr. Gerald C. Horsley.
Harrow-on-the Hill	Enlargement and Alterations of Public Offices	Mr. William Flockhart.
Newcastle (Walker Gate)	School	Mr. John Bilson.
Northwich	New Baths	Mr. F. T. Baggallay.
Nottingham (Carrington)	Parish Church	Mr. E. S. Prior.
Nottingham	Baptist Chapel	Mr. Herbert W. Wills.
Portland	New Council Offices	Mr. A. Needham Wilson.
Stockport	New Infirmary Buildings	Mr. Herbert W. Wills.
Wallsend-on Tyne	Elementary Schools	Mr. A. W. S. Cross.
Willesden	New Buildings for Children	Mr. A. W. S. Cross.

The President accepted an invitation from t Government of Manitoba to act as assess in the competition for the new Legislati Buildings at Winnipeg.

Report of the Board of Architectural Education.

The Board has held fifteen meetings since t issue of the last report. Mr. Reginald Blo field has acted as Chairman, Sir Aston Webb a Mr. Lewis Solomon as Vice-Chairmen, Mess Ernest Newton and John Slater as Ho Secretaries. The following Committees ha met and reported to the Board :—Offic Committee, Examinations Committee, Exem tions Committee, Testimonies of Study Co mittee, Designs Committee.

In November, 1911, the Council approv of a recommendation of the Board that t Slade Professors of Fine Art at the Universit of Oxford and Cambridge, and Profes A. Beresford Pite, of the Royal College of A should be invited to become advisory memb of the Board, and the Board's invitation w accepted by these gentlemen.

Licentiates' Examination.—The Board h drawn up a detailed scheme, which has b approved by the Council, for the examinati of Licentiates desirous of becoming Fello and the first examination will be held at end of June. The examiners appointed conduct the first examination are :—Reginald Blomfield, A.R.A. (Chairman of Board); Sir Aston Webb, C.B., C.V.O., R (Past-President); Mr. Henry T. Hare (H Secretary).

Examinations.—The Board has conduc the Royal Institute examinations, and results as reported to the Council have b published.

Revision of Examinations.—The Board has had under consideration a revision of the Syllabus of the Intermediate and Final Examinations. Many important modifications therein have been made and approved by the Council. A scheme of problems in design has been instituted to take the place of the old Testimonies of Study for the Final Examination, and the first sets of drawings were submitted for the approval of the Board at the end of February. Other designs will be sent in every two months, and each candidate for the examination is required to submit four of such approved designs as Testimonies of Study before being admitted to the examination. The allied societies are co-operating with the Board in carrying out this scheme by examining the designs in their respective localities. Eighteen sets of designs for the first subjects set by the Institute have been received by the Board, and eight of them have been approved. The Board has selected some of these approved designs and has sent them to the allied societies as examples of the work done by students in answer to the design problems. The various alterations in the examinations, full particulars of which have been published in the *Kalendar*, will come into operation in November next.

External Examiners.—The Board has recommended the Council to require that the work of students at the recognised architectural schools who claim exemption from the Intermediate Examination shall have been examined and approved by an External Examiner appointed by the school, such appointment having been previously approved by the Council. This recommendation has been approved by the Council, and a communication embodying this decision has been sent to the heads of the various universities and schools.

Architectural Scholarship, Rome.—A Committee of the Board, appointed at the request of the Council, has drawn up a scheme for the award and tenure of a Scholarship in Architecture instituted by the Royal Commissioners of the 1851 Exhibition, and the scheme has been approved by the Commissioners.

Prizes and Studentships.—The Board appointed Committees—comprising several members of the Institute outside the Board itself—to judge the various designs and drawings submitted for the Institute and other prizes, and reported thereon to the Council. The pamphlet of the prizes and studentships for the ensuing year, prepared by the Board, has been approved by the Council. The Board desire to draw special attention to the valuable new studentship which the "Jarvis Bequest" has enabled the Institute to found. A scheme for this studentship has been drawn up by a Sub-Committee and has been approved by the Board and forwarded to the Council.

Report of the Art Standing Committee.

In the course of their report the Art Standing Committee state that reference was made in the previous report to the Sir R. Geffrey Almshouses at Shoreditch, St. Paul's Bridge, and minor improvements in London.

It is satisfactory to record the successful issue of the Committee's efforts on behalf of the almshouses. The recommendations of the Council on the subject of the new St. Paul's Bridge were adopted by the City Corporation and expert advice was taken on the whole matter.

The subject of the uniform treatment of street name-plates in London has been further dealt with, and the Council of the Royal Institute have obtained an expression of opinion on the matter from Borough and City Councils in London. These opinions, although not unanimously in favour of a uniform treatment, were generally sympathetic. Representatives of all the civic authorities of London have been invited to a Conference to be held on the Institute premises to discuss the matter.

The Committee's inquiries were directed towards the matter of the "English" bridge at Shrewsbury. The Corporation of that town have decided to widen the bridge and not to replace it with a new structure. The threatened demolition of an extremely interesting half-timber house in the same town is now engaging the attention of the Committee.

The Committee have been engaged upon the consideration of the injurious effect of public hoardings upon English landscapes. At the suggestion of the Committee the Council expressed its approval of the efforts made in this direction by the New Malden, Surrey, District Council.

The Society for Checking the Abuses of Public Advertising invited the Royal Institute to criticise and make suggestions upon the Bill, which it is about to promote in Parliament, to extend the existing Advertisements Regulation Act. The Art Committee recommended the Council to lend the weight of their general support to the measure.

The King Charles I. equestrian statue at Charing Cross has for some time engaged the attention of the Committee, who are formulating proposals for the erection of a plaster cast in South Kensington Museum.

The sale of Tattershall Castle and the subsequent removal of the stone mantelpieces once again emphasised the necessity for adequate legislation for preventing such regrettable occurrences. The Committee urged the Council of the Royal Institute to invite the co-operation of other learned societies, with a view to formulating legal procedure to prevent the defacement of historic buildings or monuments. The National Trust for Places of Natural Beauty, desiring to take similar action, invited various societies to discuss the question. A Conference was held, which the President of the Royal Institute and a representative of the Art Committee attended. A draft measure extending the powers conferred by the existing Ancient Monuments Act was prepared and is about to be presented to Parliament.

The Literature Standing Committee.

At the request of the Council the Committee have appointed a Sub-Committee to be called the "*Journal* and *Kalendar* Committee," to assist and advise the Secretary and Editor in all matters connected with these two publications, and to make recommendations to the Council from time to time with regard to them. A further Sub-Committee has also been appointed to consider the question of the valuation of the contents of the library for fire insurance. This matter is at present under consideration, as well as a scheme for providing more adequate safeguards for the protection of the library against fire.

The Practice Standing Committee.

Since the date of the last annual report, but prior to the end of last session, the Sub-Committee which has been engaged on the question of revising the schedule of charges, and had very carefully dealt with the suggestions made in reply to the circular sent out by the Council to all members of the Institute presented their report. The proposed new schedule drawn up by them, after being carefully considered by the Committee, was forwarded to the Council with an urgent recommendation for its adoption at as early a date as possible. During the current session the members of the Sub-Committee have been invited to meet the Committee of the Council appointed to consider and report upon the matter, and the proposed new schedule is now receiving the consideration of the Council. The importance of removing some of the admitted deficiencies of the existing schedule is emphasised by the fact that, of the large number of difficulties arising in practice which have been brought before the Committee, at least one-third have dealt with questions of professional charges.

By the courtesy of members of the American Institute of Architects, the Committee have been favoured with copies of the standard documents relating to contracts, etc., which have recently been issued by that Institute, and these are being carefully considered by the Sub-Committee.

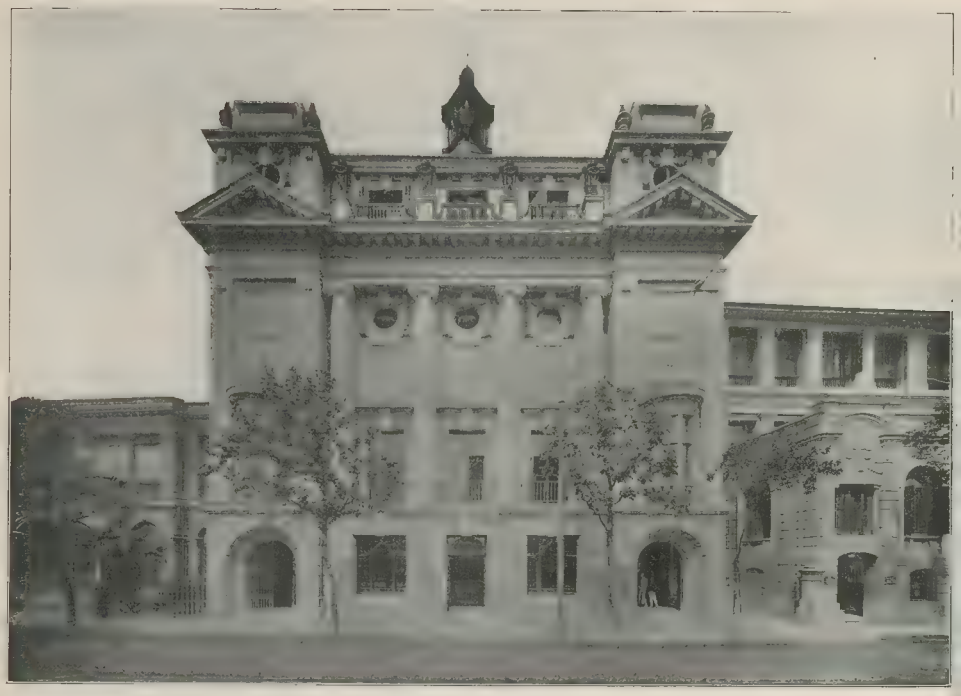
It having been brought to the knowledge of the Committee that the London Master Builders' Association is endeavouring to draw up a form of agreement between contractors and sub-contractors, a special meeting of the Committee was held at which a deputation from the Association was invited to be present. The Chairman, Secretary, and several members of the Council of that body accordingly attended. They explained the difficulties at present existing in regard to the subject and the direction in which they were trying to overcome them. A general discussion followed in which a useful interchange of views took place.

The Science Standing Committee.

Skeleton-Frame Buildings.—In the last annual report of the Science Standing Committee reference was made to the draft of a uniform scheme for preparing the necessary particulars and calculations to be submitted to District Surveyors under the provisions of the various London Building Acts, 1894–1909. During the year that has passed this scheme has been fully considered, and the Committee have now finally approved the suggestions of the District Surveyors' Association governing the deposit of drawings and calculations with District Surveyors in connexion with skeleton-frame buildings. These suggested regulations have been published by the District Surveyors' Association in folio, giving in a cheap and handy form the requirements of the latest Act, explanatory particulars of the formulæ and symbols to be employed, working stresses, weights of materials, load tables for standard sections of beams and stanchions, and diagram sheets on which may be set out the calculations in detail for easy reference. Members of the Institute will appreciate the utility of this compact publication, copies of which may be obtained from the District Surveyors' Association or their printers.

Research on Building Materials.—The approval given by the Council at the close of last session to the effort of the Committee to promote research on materials in matters affecting the profession has led to correspondence with the Imperial Technical College and interviews with the Rector and Professors. At an early stage in the negotiations it was found hopeless to expect State aid to further the object of the Committee, but it has been definitely ascertained that facilities would be afforded by the Imperial Technical College, as the leading technical institution, if some scheme of study and research could be agreed upon. The draft of a scheme prepared by the College has recently come before the Committee and is now under their consideration, but this having been put forward by the College as suggestive only and intended to form the basis of further discussion, it may be some time before the Committee will be able to report finally upon a satisfactory conclusion of its labours with regard to research.

Mortar Tests.—The volume mentioned in last year's statement of this Committee, containing the report and data of the series of tests, which extended over two years, has now been published under the auspices of the Science Standing Committee, with the generous support of the Council. This report should be in the hands of all members, as it forms a publication which will be found extremely useful to the profession at large, and contains much valuable matter and numerous diagrams. Being the latest of the Royal Institute of British Architects' series of publications, it is therefore obtainable by members from the Institute. The Committee wish to place on record their appreciation of the assistance given by the Council to their experiments and in the publication of the report referred to.



Monograph on Paints. The issue of the monograph, "Notes on the Properties and Ingredients of Commercial Paints," compiled by the Science Standing Committee, has been amply justified by the large sale of copies. Again the Committee have to thank the Council for their valuable aid in putting before the profession much important matter in a concise and handy form, and the interest shown in the issue of this pamphlet by manufacturers and the trade generally is an indication of the importance of the subject and the utility of its consideration when the Council first seeks the advice of experts and then generously gives its assistance in a material form by putting before the profession the benefit of such expert opinion.

The Use of English Timber.—A movement initiated by the English Forestry Association to promote the use of home-grown timber, and foster the industries connected with it, led to a Conference on February 20 last between the representatives of that body and four delegates appointed by the Royal Institute of British Architects' Council viz., Messrs. Max Clarke, Ernest Flint, Alan E. Munby and Wonnacott. One meeting only having been held, the Committee will, after further discussion, be able to report the result of these deliberations to the Council.

Incorporated Joint Committee on Water Regulations.—A reference from the Council to the Committee has resulted, after inquiry and correspondence, in the Institute ceasing to be represented on this body.

Among minor matters dealt with in the course of the session, on which advice has been sought or which are still under investigation, may be mentioned:—

(*a*) *Defects in Roofing Tiles*, particularly

Masonic Hall, Shanghai.

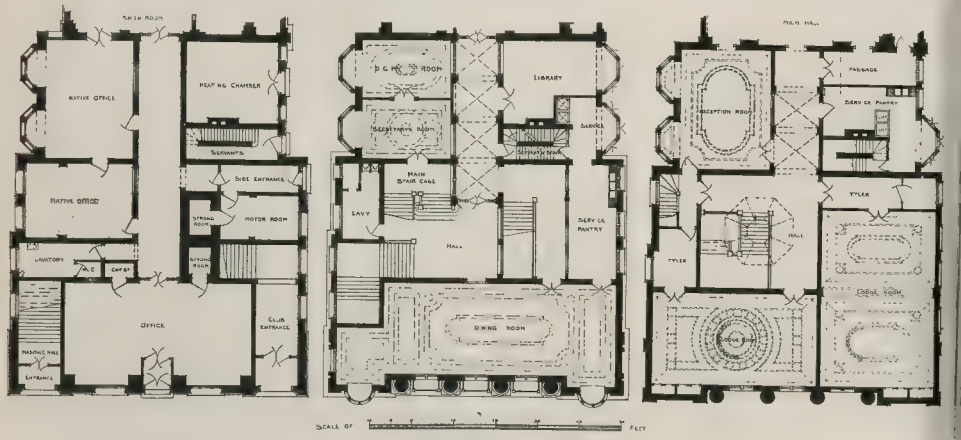
Messrs. Christie & Johnson, Architects.

machine-made varieties. Specimens, with information bearing on them, are being collected from various quarters. The Committee gratefully record the offer of assistance from Mr. H. Greville Montgomery, M.P., who has promised a collection of defective tiles and to assist with information in every way possible.

(*b*) *Valve Closets.*—As some public authorities have recently taken up the attitude of condemning this pattern of fitting as out of date, the Committee have been unable to support this view, as the alleged defects arise from removable causes and not from the design of the apparatus.

(*c*) *Preservation of Decayed Stonework.*

(*d*) *Corrosion of Pipes and Tanks* by moorland waters, on which the Committee hope shortly to issue a brief statement.



(*e*) *South African Marbles and Building Stones*, and

(*f*) *Decay of Lead Dressings on Roofs.*

MASONIC HALL, SHANGHAI.

THIS Masonic Hall has been completed by Messrs Christie & Johnson at the port of Shanghai. The work was carried out in two portions, the first or back portion being finished about two years ago, and that which is illustrated, and which completes the scheme of reconstruction, was opened about a year ago.

The building is faced with artificial stone blocks backed with local bricks, whilst the woodwork generally is of Singapore hardwood. The main staircase is of teak wood, as is also the panelling of the two lodge-rooms. The building throughout is heated by radiators on the low-pressure hot-water system, the foul air being carried away by means of extract fans. Fresh air is introduced into the lodge rooms by special ventilating shafts.

ARCHITECTURAL SOCIETIES.

The Architectural Association.

The Architectural Association spent a very ɔeasant evening last Friday. At 7.30 the resident, Mr. Gerald Horsley, opened an xhibition of loan drawings and photographs of ɔntemporary work—to which we refer in ır leading article—and at 8.30 presided over most enjoyabe and successful smoking ɔncert arranged by the members.

The designs illustrated included details of . Paul's Girls' School, by the President; the ritish Museum extensions, by Mr. J. J. Burnet, ustrated by perspective views, ¼-in. tails, and photograph of a model; the rand Trunk Railway, the Royal College of ience, and other works by Sir Aston Webb; e London, Edinburgh, and Glasgow Insurance ices in Euston-square, by Professor Pite; iginal drawings, details, and photographs, Mr. Ernest Newton; photographs of houses, Mr. T. E. Collcutt; photographs and details houses, by Mr. Lutyens, Mr. Guy Dawber, ofessor Blomfield, Mr. Bolton, and others. ntributions also came from Mr. Charles ooner, Mr. Voysey, Messrs. Ashley & Winton ewman, Mr. Wontner Smith and Mr. Carõe; o from Messrs. H. T. Hare, Curtis Green, offry Lucas, C. G. Scott, Walter Tapper, rwick & Hall, Ralph Knott, Ernest George & ates, W. A. Pite, Walter Cave, Forsyth & ule, H. M. Fletcher, Robert Atkinson, Theore Fyfe, and Stanley Hamp. Mr. Greenslade it his ½-in. details for the Aberystwyth rary, and Mr. Herbert Baker the Union ildings at Pretoria.

The Exhibition, which is well worth a visit, is n to May 11.

The A.A. Athletic Club.

The Council of the Architectural Association given the General Committee of the Athletic b power to elect any member of the kindred fessions, *i.e.*, Architecture, Painting, Sculpe, and Surveying, as a member of the Club. Club was founded in 1906, and owing to rowing popularity it was decided to purchase a ground of 6½ acres at Boreham Wood, which is situated near the station and about half an hour from town. The whole of this land has now been drained and levelled, and Rugby football, hockey, and cricket pitches arranged. A pavilion has been erected with accommodation for changing, washing, and light refreshment. The ground was formally opened last summer by Lady and Sir Aston Webb. It has cost nearly 2,500*l.* Members wishing to join the Club should apply to Mr. John H. Squire, Hon. Secretary, care of the Architectural Association.

Sheffield Society of Architects.

At the annual meeting of the Sheffield Society of Architects and Surveyors, held at the University, Mr. J. B. Mitchell-Withers presiding, the Hon. Secretary, Mr. James R. Wigfull, presented the twenty-fifth annual Report. Referring to Sheffield's new building by-laws, Mr. Wigfull said there was a want of elasticity in their provisions, while too great a desire to conserve the old methods of building was evinced, and too little encouragement given to more modern methods and materials.

Referring to the competition for plans for the Sheffield King Edward Memorial Cripples' Home, he said that the conditions for the competition had been issued, and the Council hoped that the response would be such that the local authorities would be encouraged to follow this example and again place some of the plans for the public buildings of the city in the hands of architects in private practice. Such a course would promote a spirit of healthy rivalry, from which the city would derive benefit.

The Council had had under consideration, continued Mr. Wigfull, various proposals with regard to the width of roads, especially with a view to their modification in circumstances where they are not main thoroughfares and where only a few houses are served by them. A suggestion by Mr. Sandford that on hilly sites, where terrace roads are formed, these should be of half the usual width and have houses on one side only, met with general approval; but it was felt that this proposal dealt only with part of the problem so far as Sheffield was concerned, and that in such circumstances as those indicated above a general reduction in the width of road was desirable.

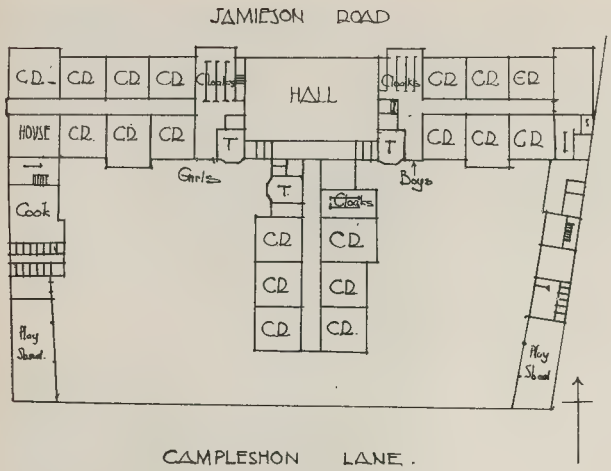
The report was adopted on the motion of Mr. Potts, seconded by Mr. Frank Winder.

It was reported that the past year had seen the credit balance of 60*l.* reduced to 38*l.*, and in accounting for this Mr. Wigfull said it was not so bad as it appeared to be, as the Society had paid during the year two contributions of 25*l.* (for two years) to the Sheffield University.

The election of officers for the ensuing year resulted as follows:—President, Mr. J. B. Mitchell-Withers (re-elected); Vice-President, Mr. A. F. Watson (re-elected); Hon. Treasurer, Mr. R. W. Fowler; Hon. Secretary, Mr. J. R. Wigfull (re-elected); Council, Messrs. W. G. Buck, F. E. P. Edwards, C. B. Flockton, J. R. Hall, C. F. Innocent, H. L. Paterson, H. I. Potter, E. Winder, and F. H. Wrench.

A selection from the prize drawings of the Royal Institute of British Architects, 1912, was on exhibition.

Guild of Architects' Assistants.



The annual general meeting of the Guild of Architects' Assistants was held at Prince Henry's Room, 17, Fleet-street, E.C., on May 1, the President of the Guild, Mr. A. W. S. Cross, M.A., F.R.I.B.A., presided. The following resolution was proposed by Mr. S. Douglas Topley, A.R.I.B.A., seconded by Mr. J. V. Hibbert, F.S.I., and carried unanimously: "The Guild of Architects' Assistants declares itself in opposition to the published proposals for the Registration of Architects, and calls upon its members and friends in the promoting societies to oppose any measure lacking complete provision for the interests of the pupil and the assistant." Copies of this resolution have been sent to the Royal Institute of British Architects and the Society of Architects.

Royal Institute of the Architects of Ireland.

A meeting of the Council of this body was held on May 6 at the Institute Rooms, No. 31, South Frederick-street, Dublin. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. There were also present Messrs. W. Kaye-Parry, R. Caulfeild Orpen,

Masonic Hall, Shanghai: North Lodge Room.
Messrs. Christie & Johnson Architects.

York Elementary School: First Premiated Design.

By Mr. J. T. Proffitt, M.Inst.C.E.

L. O'Callaghan, F. Hayes, C. H. Ashworth, A. G. C. Millar, H. Allberry, J. H. Webb, F. Hicks, G. P. Sheridan, Professor Scott, and C. A. Owen, Hon. Secretary.

The minutes of the previous meeting were read and signed. The correspondence, including several letters from the Royal Institute of British Architects, the Labour Exchange, the National University, the Local Government Board, etc., was dealt with.

It was decided to subscribe towards a portrait of the President of the Royal Institute of British Architects. A notice of motion in connexion with the examination scheme was handed in.

NEW ELEMENTARY SCHOOL, YORK.

AN open competition has recently been held for a new elementary school at York. Messrs. T. Mellard Reade & Son were appointed assessors, and their award, as has been previously announced, was as follows:—(1) Mr. J. T. Proffitt, Walkden, near Manchester; (2) Mr. E. R. Barrow, Strand, W.C.; (3) Mr. J. A. O. Allan, Aberdeen.

No less than 203 designs were submitted We would compliment the promoters of the competition upon the fact that they have endeavoured, as much as possible, to reduce the amount of labour imposed upon competitors. The plans were to be drawn to 1-16-in. scale, and neither details nor perspective were required, and we hope this will be a precedent for future competitions of this nature.

But we are bound to deplore again, in this as in many other cases, the enormous amount of energy expended by the profession for so little reward.

In this competition over two hundred architects are engaged upon a problem which is all the more difficult and uncertain because of the vagueness of the Board of Education requirements at this juncture. Just at a time when some interesting, and perhaps novel, development in school planning is to be expected, we see a large section of the profession, including many well-known experts, concentrated upon the problem as presented in this instance; and the reward for this is nothing more than the chance of securing a commission on work which will be carried out—a commission which, be it noted, will afterwards have to be earned in the ordinary course by the fortunate winner. We cannot blame the promoters, except that it is not to their credit that in this, of all competitions, no premium is awarded.

The profession may, however, congratulate itself on the exhilarating exercise in school planning which has fallen to its lot.

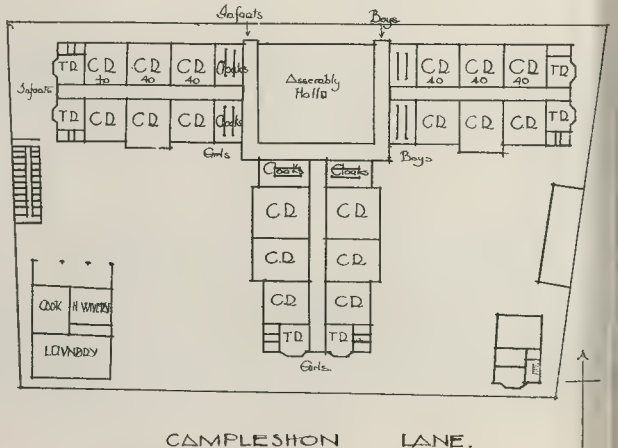
Accommodation was asked for 250 boys, 300 girls, 250 infants, with a limit of cost of 10,000*l*. The site is in Campleshon-lane, about a mile from the centre of the town. It is bounded on three sides by streets not yet formed, and one cannot but regret the manner in which the development of this part of York is taking place. In a few years it will have the appearance of the slum of a manufacturing town, little worthy of a city of the architectural dignity of York.

In view of the large number of schemes submitted, it is natural that many excellent solutions of the problem were found. In the uncertainty of the regulations of the Board of Education, the disposition of the hall is at present the main consideration of the plan, and this point was left entirely to the discretion of the competitors. The evolution of the hall of the elementary school will form nearly as interesting a study as that of the hall of the manor house has been in the past.

There is great similarity in plan between the first and second premiated designs. Both have adopted a T-shaped plan, with the hall at the intersection to serve the three departments. The playground is thus open to the south, and, being divided into two, the girls and infants will play together, which is no doubt the best arrangement.

The drawback of this plan is that t cloakrooms are in the centre of the bloc and their cross-ventilation and disconnexi cannot be obtained so effectively as wh they are at the end of the building. T classrooms accommodate forty children, wi two for fifty children, a great improveme on many recent schools, where the majori of the classrooms are for fifty or more. T arrangements of the winner are general quite satisfactory, but the steps leading the hall on the boys' side are at an awkwa place, though they are no doubt unavoidab from the sloping nature of the site.

The second premiated design is inferi to the first in one or two respects. The pla grounds are too irregular, and the infan entrance, at a distance from the cloakroo is hardly satisfactory, while the author h shown ingenuity in preventing the teache from overlooking the playgrounds.



We welcome the third premiated design a clever attempt on more or less origin lines. South light has been provided every classroom, the hall is thoroughly w lighted and cross-ventilated, and each cor dor has windows on one side. The obvio drawbacks are the irregularity of the pla grounds and the cubical contents—we dou if it is at all possible to build an elementa school at 5d. per foot. On the whole, doubt the winner will provide a school whi will prove serviceable and convenient, b the elevations are feeble and uninteresti and we are sorry that some more come design could not have been chosen to carried out within a mile of York Cathedr

ENGINEERING SOCIETIES.

The Concrete Institute.

A meeting of the Concrete Institute to place at Denison House, 296, Vauxhall Brid road, Westminster, S.W., on April 25, Profes Henry Adams, M.Inst.C.E., in the chair.

A discussion took place on two Repo presented by the Tests Standing Committee the Concrete Institute, entitled (*a*) "The Testi of Concrete, Reinforced Concrete, and Materi Employed Therein"; (*b*) "The Testing Reinforced Concrete Structures on Completion The following took part in the discussion: Mr. M. E. Yeatman, M.A., M.Inst.C. M.Am.Soc.C.E., M.C.I., Mr. William G. Kir aldy, Assoc.M.Inst.C.E., M.C.I. (Chairman the Tests Standing Committee), Mr. D. Butler, Assoc.M.Inst.C.E., F.C.S., M.C.I., M A. O. Trechman, F.C.S., M.C.I., Mr. R. Sinclair, M.C.I., Mr. Percival M. Fras A.R.I.B.A., M.C.I., Mr. J. B. Institution of Civil Engineers.

At the annual general meeting of the Institution of Civil Engineers, held on Tuesday evening, April 30, the result of the ballot for the election of officers was declared as follows :—President—Mr. Robert Elliott-Cooper (London); Vice-Presidents—Mr. Anthony George Lyster, M.Eng. (Liverpool), Mr. Benjamin Hall Blyth, M.A. (Edinburgh), Mr. John Strain (Glasgow), Mr. George Robert Jebb (Birmingham); other members of Council—Mr. John A. F. Aspinall, M.Eng. (Liverpool), Mr. John A. Brodie, M.Eng. (Liverpool), Mr. William B. Bryan (London), Colonel R. E. B. Crompton, C.B. (London), Mr. J. M. Dobson (London), Sir Frederick H. Donaldson, K.C.B. (London), Mr. E. B. Ellington (London), Mr. W. H. Ellis (Sheffield), Mr. W. Ferguson, M.A., B.A.I. (Australasia), Sir Maurice Fitzmaurice, C.M.G. (London), Sir John Purser Griffith (Ireland), Mr. C. A. Harrison, D.Sc. (Newcastle-on-Tyne), Mr. Walter Hunter (London), Mr. Harry E. Jones (London), Mr. E. H. Keating (Canada), Sir Thomas Matthews (London), Mr. W. H. Maw, LL.D. (London), Mr. C. L. Morgan (London), Mr. Basil Mott (London), Hon. Sir Charles Parsons, K.C.B. (Wylam-on-Tyne), Mr. F. E. Robertson, C.I.E. (London), Mr. Alexander Ross (London), Hon. Sir Francis, J. E. Spring, K.C.I.E. (India), Mr. A. M. Tippett (S. Africa), Sir Philip Watts, K.C.B. (London), Mr. W. B. Worthington (Derby). This Council will take office on the first Tuesday in November, 1912.

The Council have made the following awards for papers read during the Session 1911-12 :—Telford Gold Medals to Messrs. Ernest and Walter Mansergh (London); a George Stephenson Gold Medal to Mr. Roger T. Smith (London); a Watt Gold Medal to Mr. A. H. Roberts (Leith); Telford Premiums to Messrs. John Goodman (Leeds), A. B. McDonald (Glasgow), G. Midgley Taylor (London), D. C. Leitch (London), W. C. Easton (Glasgow), and D. H. Morton (Glasgow); and the Manby Premium to Mr. S. H. Ellis (Liverpool).

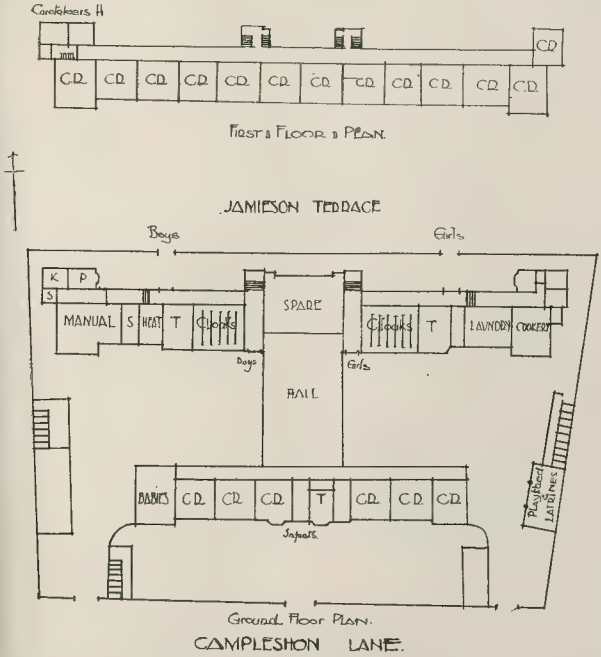
The award for papers published in the *Proceedings* without discussion and for students' papers will be announced later.

GENERAL NEWS.

Fleet-street Alterations.

The widening of the south side of Fleet-street will be advanced shortly by the demolition at Serjeants' Inn of the Norwich Union building. Enlarged offices for the company will be built on about the same site from designs by Messrs. Howell & Brooks, 4, Queen Victoria-street, E.C.

Houses of Historical Interest in London.



Commemorative tablets have been affixed to No. 32, Craven-street, Strand, where Heinrich Heine lived in 1827; No. 12, Seymour-street, Portman-square, a home of Balfe in 1861-4; and No. 28, Finchley-road, St. John's Wood, the home of Thomas Hood from 1843 until his death in 1845. It is stated that the Duke of Westminster has undertaken to affix a tablet to No. 10, South-street, Mayfair, which was the residence of Miss Florence Nightingale during the last thirty-five years of her life.

Metropolitan Public Gardens Association.

At their last quarterly meeting, held under the presidency of Sir William Vincent, Vice-Chairman, it was announced that the laying-out of St. Mary's churchyard, Bow-road, the hospital garden, Putney, and Southwark Cathedral yard was completed, and that the disused burial-ground in Philpot-street, Stepney, would be dealt with as soon as an arrangement is made for its maintenance; this last-named ground appertained to the Wycliffe Congregational Chapel, lying behind St. Andrew's (Scottish) Church. The Association agreed to grant 100*l.* towards the acquisition and vesting in the National Trust of a tract of 1¼ mile, with meadow and woodland, for a recreation ground by the side of the Wandle, near Wimbledon; a sum of 3,000*l.* is needed in respect of the proposed playground in Kensal New Town.

Housing Exhibition in Paris.

An "Exposition Internationale des Arts de Travail" will be held in the Grand Palais des Champs Elysées, Paris, from July to October. British exhibits will be welcome. The office of the Exhibition is 72, Rue Saint-Lazare, Paris.

York Elementary School: Third Premiated Design.

By Mr. J. A. O. Allan.

Panama Exhibition, 1915, San Francisco.

Mr. John Hays Hammond, President of the Commission, and his colleagues have arrived in London. The Commissioners are appointed by the President of the United States to support his request to European Governments to participate in the Exhibition at San Francisco to celebrate the formal opening of the Panama Canal on January 1, 1915, by the President of the United States. The exhibition will be held in that year upon a site having a frontage of 2 miles to Francisco Bay. A sum of ten millions will be expended upon the grounds and buildings, and a congress hall will be erected in San Francisco at a cost of 200,000*l.*

Memorial to the Pilgrim Fathers.

Mr. R. M. Lucas has prepared the designs of a monument which it is proposed to erect in Southampton upon, or close to, the spot of embarkation in the *Mayflower* in 1620. Panels for the composition will be contributed by various American patriotic societies.

The Flodden Wall, Edinburgh.

It is understood that the contemplated enlargement of the Royal Scottish Museum buildings will cover the site of the portion of the Flodden Wall at the rear which was exposed to view recently. It is proposed that a part of the structure shall be retained *in situ* and in such a manner that it shall constitute an exhibit in the Museum.

Exhibition at Hammersmith.

In connexion with the Hampshire House Club for Working Men, in Hampshire Hog-lane, Hammersmith, a free picture exhibition will be opened until June 2. Works by the following living artists are shown among others :—Mr. Muirhead Bone, Mr. Brangwyn, Mr. Cadogan Cowper, Mr. Cameron, Mr. Clausen, Mr. Connard, Mr. Crane, Sir Charles Holroyd, Mr. John, Sir W. B. Richmond, Mr. Charles Shannon, Sir Frank Short, Mr. Strang, Mr. Havard Thomas.

Lectures on Concrete Engineering.

The periodic lectures on practical and theoretical concrete engineering have been resumed at the Cambridge University Engineering Laboratories, the lecturer being Mr. A. C. Davis, of the Saxon Cement Company, Cambridge.

Architectural Draughtsmen and the Board of Works.

Mr. P. Snowden had three questions on the paper on Monday night to ask Mr. Benn, as representing the First Commissioner of Works, with regard to the architectural staff of the Board of Works. The first was whether the proposed staff of permanent Architectural Draughtsmen and Technical Assistants is intended to include all the men in the present staff classed and certificated as Architectural Assistants; and whether he will see that the misnomer Draughtsmen formerly applied to these professional men but remedied, at the request of the class, to Architectural Assistants in 1907 shall not be again reverted to.

Mr. Benn said the answer to the first part of the question was in the negative. Only those gentlemen who were eligible under the new scheme are intended to be included in the proposed new class. If there is a general desire the name of the proposed establishment can be altered. The scheme which is under consideration lays down certain conditions, and if these conditions are satisfied they will be asked if they desire that be included in the new scheme.

Mr. Snowden next asked whether, in view of the undertaking made by his predecessor in this House on December 7 last that the desires of all of the class termed Architectural Assistants engaged in the Office of Works shall be ascertained if they desire to be placed upon the established list, he is aware that no such inquiry has been made; and whether he can now state how soon this undertaking will be carried into effect.

Mr. Benn replied that so soon as the scheme now before the Treasury has been approved the desires of all those gentlemen who are eligible for appointment to established rank as Architectural or Technical Assistants, as the case may be, will be ascertained.

Mr. Snowden further asked whether he is aware that his proposal would lower the status of those professional men engaged for years in his department and termed and certificated as Architectural Assistants by their inclusion

in the proposed staff of Architectural Draughtsmen and Technical Assistants; and whether he is aware that the professional ability and duties performed by this class are at the least equivalent to the class termed Assistant Architects, and therefore will he consider the justice of awarding in return equivalent conditions of service to all the class in question to that now granted to the Assistant Architects' class.

Mr. Benn said the First Commissioner is not of opinion that his proposal will involve any lowering of the status of those gentlemen, but if they object to the designation of Architectural Draughtsmen he is quite ready to style them Architectural Assistants. Mr. Snowden was mistaken in supposing that the professional abilities and duties of these two classes are the same.

Office of Works and Public Buildings.

The following is a summary of the salaries and other payments provided for in the Civil Service estimates for the year ending March 31, 1913, in respect of the Architects and Surveyors' Division of his Majesty's Office of Works and Public Buildings:—Principal Architect and Surveyor, England, 1,200*l.*; ditto, Scotland, 1,000*l.*; eleven architects and surveyors (minimum 550*l.*, maximum 750*l.*, except in three cases in which the maximum is 900*l.*), 7,550*l.*; twenty assistant architects and surveyors, first class (minimum 350*l.*, maximum 450*l.*), 8,100*l.*; twenty-eight assistant architects and surveyors, second class (minimum 200*l.*, maximum 300*l.*), 7,139*l.*; one sanitary assistant, first class (minimum 350*l.*, maximum 450*l.*), 425*l.*; two sanitary assistants, second class (minimum 200*l.*, maximum 300*l.*), 500*l.*; one clerk, first class (old establishment), 400*l.*; three staff clerks (minimum 300*l.*, maximum 400*l.*), 945*l.*; nine clerks, second division (minimum 70*l.*, maxima 130*l.* and 300*l.*), 1,135*l.*; nineteen assistant clerks (minima 45*l.* and 55*l.*, maxima 85*l.* and 150*l.*), 1,279*l.*; three female typists, 186*l.*; one draughtsman (minimum 210*l.*, maximum 280*l.*), 270*l.*; draughtsmen and technical assistants for additional services that may be required (no fresh appointments to the post of permanent draughtsmen being at present made), 25,750*l.*; one shorthand writer, 87*l.*; eight clerks of works, first class (minimum 250*l.*, maximum 300*l.*), 2,662*l.* (seven of these officers receive as house allowance one-sixth of salary, and one has an official residence); one clerk of works, first class, temporary, 326*l.*; nineteen clerks of works, second class (minimum 150*l.*, maximum 220*l.*), 4,210*l.*; two clerks of works, temporary (for Ancient Monuments and Historic Buildings), at 4*l.* 4*s.* per week, 436*l.*; temporary assistance at office in China, 1,400*l.*; professional charges and expenses, 1,200*l.*; tracing drawings, 700*l.* The Principal Architect, in addition to his salary of 1,200*l.*, receives an annual payment of 400*l.* for his services as architect in connexion with the erection of the new public offices at Westminster.

Parliament and the Town Planning Act.

In the House of Commons on May 1 Sir A. Griffith-Boscawen asked the President of the Local Government Board what steps had been taken under Part II. of the Housing and Town Planning Act, 1909, by any of the local authorities of London and of what is termed Greater London; and whether, in view of the tendency of the population to move outwards and the desirability of encouraging this tendency, and in view also of the great multiplicity of authorities in Greater London, he will consider the possibility of forming a Housing and Town Planning Board to embrace the County of London and the districts outside with a view to attaining uniformity and consistency in the planning of these new districts? Mr. Burns, in a written reply, pointed out that the London County Council was the only local authority in the Administrative County of London under Part II. of the Housing and Town Planning Act, 1909, but he was not aware that any steps had been taken by the Council with a view to the preparation of any town planning scheme. As regards districts in the immediate vicinity of London, Ruislip-Northwood and Hanwell have received authority to prepare schemes, Walthamstow had made application for such authority, and Enfield, Southgate, Finchley, East Barnet, Hendon, Willesden, Wembley, Bushey, Greenford, Hayes, Southall, Norwood Acton, Twickenham, Barnes, Richmond, Ham, Esher, and the Dittons, Surbiton, Malden and Coombe, Merton, Epsom, Epsom Rural, Sutton, Carshalton, Croydon, Croydon Rural, and Beckenham have all taken steps in the matter, and many of these authorities have been in consultation and co-operation with one another. On the information before him he should not be disposed to regard the formation of a Housing and Town Planning Board for Greater London as desirable, but he should agree that in certain matters there should be consultation and co-operation between the local authorities, and he would expect the London County Council to take a leading part in securing it.

Ravenhead Scholarship.

In acknowledgment of a suggestion by Professor Reilly, whereby improvements were effected in the stock bricks of the Ravenhead Brick Company, the company have offered an open entrance scholarship of 30*l.* a year for two years to the School of Architecture. The scholarship is open to any architectural student between the ages of eighteen and twenty-three years on June 1. Candidates will be required on or before June 1 to submit to the Professor of Architecture not more than six sheets of drawings and designs, attested as their own work, together with evidence of having studied the elements of building construction. The drawings must be accompanied by a written statement giving details of general and professional education. Selected candidates shall go to Liverpool if thought necessary by the examiners and submit themselves to a short examination, oral or otherwise. The examiners shall be the Professor of Architecture and the two lecturers in the school. The successful candidate shall take the Certificate Course in Architecture (which exempts students from the Intermediate Examination, R.I.B.A.), and enter upon it in the following October term. The scholarship may be withheld by the University in the second year on the report of the Professor of Architecture as to the work done by the scholar during the first year.

Diplomatic and Consular Buildings.

The estimate of the amount required to be voted by the House of Commons for the maintenance and repair of diplomatic and consular buildings, and the maintenance of certain cemeteries abroad, during the year ending March 13, 1913, is 37,712*l.* During the same period it is proposed to spend 41,090*l.* on new works, alterations, additions, and purchases, the chief items under this head being as follows: Provision of reception-room in Agency House at Cairo, 6,000*l.*; adaptation of Legation House at Cettingé, 3,250*l.*; rebuilding of Embassy House at Therapia, Constantinople (destroyed by fire last year), 5,000*l.* on account (ultimate estimated cost, 20,200*l.*); erection of new Legation House at Sofia, 10,000*l.* on account (ultimate estimated cost, 22,600*l.*); for completion of new consulate at Changsha, China, 300*l.* (amount already expended, 5,500*l.*); on account of new consulate at Dairen, 2,000*l.* (total estimated cost, 7,500*l.*); on account of rebuilding of consulate at Hakodate, 2,000*l.* (ultimate estimated cost, 4,000*l.*); additions to Supreme Court and consular offices at Shanghai, 3,000*l.* on account (ultimate estimated cost, 4,000*l.*); extension of servants' quarters at Ambassador's House, Tokio, 1,100*l.* Subjoined is a list of the buildings and cemeteries maintained out of the principal vote of 37,712*l.*: Embassy Houses at Berlin, Constantinople, Madrid, Paris, Rome (including summer residence at Posilipo), St. Petersburg, Tokio, Vienna, and Washington. Legation and consular buildings in China, Japan and Corea, Abyssinia, Egypt, Morocco, Persia, Siam, and Zanzibar. Legation Houses at Athens, Brussels, Bucharest, Christiania, Copenhagen, Lisbon, Mexico, Rio de Janeiro, Petropolis, Stockholm, and The Hague. Consular House at Dakar, Leopoldville, Lourenço Marques, Mozambique, Mourovia, Noumea, Samoa, Stanleyville, Tahite; and elsewhere. Cemeteries at Athens, Bayonne, on the Bosphorous; in China, Japan, Corea, and Siam; in the Ionian Islands (Corfu, Cephalonia, Zante, Ithaca, Cerigo, Paxo, and Santa Maria); Cathcart's Hill, Crimea; Gallipoli, the Pirœus, and at Suakin.

COMPETITION NEWS.

New Town Hall for Newcastle.

At the meeting of the Newcastle Town Council a report from the New Town Hall Committee was considered, in which the opinion was expressed that the most suitable site for the purpose of the new City Hall would be that now occupied by the Northumberland Baths. On this site, the Committee state, one large hall, to seat 3,500, and also a smaller hall to seat 800, could be provided, and sketch plans prepared by the property surveyor showed the provision also of suitable reception-rooms. The estimated cost of the scheme, including furnishings, contingences, etc., and site, is put at 100,000*l.* If the Council approved of this scheme, the Committee further recommended that they be authorised to advertise for competitive designs for a new City Hall, and to offer, therefore, the following premiums for the three best:—First, 500*l.* (to be merged into commission in the event of the recipient obtaining the work); second, 250*l.*; third, 125*l.* Sir Henry Newton, in moving the adoption of the Committee's report, stated that the town of Newcastle was the Northern Metropolis, and that it was not creditable that they should be without a gathering ground for great occasions. Mr. A. J. Robinson, in seconding the motion, said that the present Town Hall had never been satisfactory, and could not be made so, inasmuch as it had been ill-designed, uncomfortably seated, with entrances and exits which were, in the opinion of at least one city engineer, really dangerous. Alderman Fitzgerald, in opposing the scheme, said that for the size of its population no city was better equipped in the matter of halls than Newcastle, and pointed out that the profits on the present Hall had only been 42*l.* per annum for the past few years. After further discussion the matter was adjourned.

Municipal Buildings in Glasgow.

The Municipal Buildings Committee of Glasgow Corporation have appointed, subject to the usual sanction, Mr. John James Burnet, A.R.S.A., Hon.LL.D., assessor in connexion with the competitive plans and designs to be invited from outside architects for the erection of new buildings on the east side of John-street, at an estimated cost of 80,000*l.* Dr. Burnet is to be paid 30*l.* for his services, plus one-fifth per cent. upon the estimated cost of the proposed buildings. The Committee have remitted to the City Engineer, with the assistance of Dr. Burnet, to prepare and submit to them the drafts of the terms and conditions of the competition.

Padiham Municipal Offices.

Members and Licentiates of the Royal Institute of British Architects are asked not to take part in this competition, because the conditions are not in accordance with the published regulations of the Royal Institute for architectural competitions.

Mill Hill Music School.

A limited competition has recently been held for a Music and Art School at Mill Hill School to commemorate the twenty-one years' work of the present headmaster, Dr. J. D. McClure. Nine architects, who were Old Millhillians, were invited by the Old Millhillians Club to compete, and seven sets of plans were received. The result was, first, Mr. Martin S. Briggs, A.R.I.B.A., 14, North Audley-street, W.; second, Messrs. Crompton & Bedells, FF.R.I.B.A., 6, John-street, Bedford-row, W.C.; third, Mr. Ivor P. Jones, A.R.I.B.A., 18, St. Mary-street, Cardiff. The assessors were Messrs. Collcutt and Hamp.

Fire Station, Cardiff.

Mr. A. Marshall Mackenzie, A.R.S.A., is the assessor in the competition for a new Fire Station in Westgate-street, Cardiff. The author of the design placed first will be employed to carry out the work, subject to the usual reservations, and premiums of 75*l.*, 50*l.*, and 25*l.* will be given to the authors of the second, third, and fourth designs respectively.

Cheshire County Council School, Port Sunlight.

The Competitions Committee of the Liverpool Architectural Society are in correspondence with the Cheshire County Council over the proposed competition for a school at Port Sunlight. Members are requested to refrain from applying for the conditions at present, as the Society are pressing for the usual 5 per cent. commission and premium to competitors.

Cottage Hospital, St. Anne's-on-the-Sea.

After lengthy consideration of the designs submitted in this competition, the Committee have returned the drawings to the various competitors with the intimation that, having had "the benefit of the opinion of a competent assessor, they do not see their way to make an award. They are strongly advised that none of the designs can possibly be carried ou

for the sum of 2,500*l.*, the limit specified." The ending of this competition is felt to be unsatisfactory. None of the competitors has been given the opportunity to qualify his estimate, and there seems reason to believe that matters could have been adjusted.

Regent's Quadrant Competition.

An additional inducement to competitors in the competition organised by the *Builder* is referred to in "Notes," page 537.

BOOKS.

The Abbey of St. Mary, Croxden, Staffordshire. By CHARLES LYNAM, F.S.A. (London: Sprague & Co. 1911. 25s. net.)

THIS is one of the most complete monographs on a subject at once worthy of exhaustive treatment, and not so intricate or extensive as to defy the attempt, that we have seen. The ruins investigated are comparatively little known, and, although essentially in the same category, they cannot rank, in the matter of interest chiefly due to better preservation, with such examples as Tintern Fountains or Rivealux. Mr. Lynam, who has known the place for the greater part of his life, has undertaken his research with a thoroughness and zealous patience which virtually endow him with ownership of the ruins as they stand, and certainly of the buildings as they must have been, since the monks who lived in them are so long dead. Not the least interesting section of the work before us deals with these same monks as they were, their life and affairs and tribulations, in the form of lengthy extracts translated from the monkish Latin chronicle of William of Schepeshered—whose account begays a daily round and a yearly calendar of the most ordinary and average description. Indeed, the whole abbey and matters connected with it have such pronounced conformity to type—that elusive "type" which is seldom exists in historical actuality—as to afford matter for very real satisfaction to the synthetic historian who values the rule, as distinct from the analytic kind that professes to dilate on the exception. The plan, as pieced together from what remained above ground, together with what has been discovered by excavation, is an almost exact parallel to that of Beaulieu, with its apsidal end and chapels. The analogy is so close that perhaps it may help to settle one, at least, of Mr. Lynam's doubts—that one, we mean, concerning the wall running east and west between the south walls of the warming house and kitchen, which apparently cuts across the end of the fine long frater or refectory. May it be that, as the severity of the Order relaxed somewhat, they found it desirable to have a sort of servary or anteroom between the refectory and the kitchen, acting also as a vestibule to the cold side of the cloister beyond, such as the arrangement indicated by Mr. Brakespeare on his plan of Beaulieu? We make this suggestion with all diffidence. Study of drawings and photographs and sketches, however complete—and in this case they are very complete indeed, there being seventy-five plates altogether—cannot hope to add much to sixty-two years of loving familiarity with the stones themselves, for the author, in his dedication to the Earl of Macclesfield, the owner of the property, says that he has known the ruins since 1850, he being now eighty-two years of age. He follows his dedication with descriptive particulars of the surroundings of the abbey and its site, which show that in this instance the monks were in no way inferior to others of their kind in the sagacity of their choice. The abbey stands in the accustomed fertile and sheltered vale, watered by a clear stream, which supplies power and all their needs. Within half a mile there is the hill from which the stone for all the buildings was quarried. The settlement was made in the midst of 70 acres, enclosed by a high wall. Descriptive notes on each part follow, but these must be left to those who will procure the book itself. As will be seen from the plan herewith, the church is of well-proportioned design, with a chevet of five apsidal chapels. The total length is 235 ft., with a total internal width across nave and aisles of 52 ft. 8 in. The reproduction does not show the colours, which indicate the dates ascribed to the various buildings. The church itself and sacristy are of the late XIIth and early XIIIth centuries. The chapter-house, novices', and warming room, and the hospital, etc., are dated 1242-1274. The western buildings, rere-dorter, and abbot's lodging, the early XIVth century, with the small piece of wall above referred to, and cutting the frater in two is ascribed to the late XVth century. Eighteen plates of measured drawings, twenty-one of sketches, thirteen of photographs, and sixteen of measured details follow. There is a reproduction of the original charter, from the Bodleian, with a translation; a page of the original chronicle, with a translation of all relevant matter from the whole; and the book concludes with a list of the abbots and monks, and an account of the origin of the Verduns, who founded the house in 1176—altogether, as we have said, a model of thoroughness and of what such a monograph should be. Nor must we omit to mention the excellence of the plates and general *ensemble* by Messrs. Sprague.

Practical Chemistry for Engineering Students. By ARTHUR J. HALE, B.Sc. (London: Longmans, Green, & Co. Pp. 192. 3s. net.)

EVERY engineering student worth his salt wants to know something more about the materials which he has to handle than facts learned at second-hand as to their suitability for certain particular purposes and conditions; and, indeed, the need for a knowledge of chemistry in so far as it affects engineering materials is now generally acknowledged by the educational authorities of the profession. At the same time, it is useless to ignore the practical difficulty of finding space in the curriculum for a general course in chemistry, and the consequent danger of learning many things ill and nothing well. Mr. Hale has endeavoured to meet the difficulty by compiling a course of progressive laboratory experiments in which, so far as it is practicable, the materials usually selected by the text-books are replaced by those with which the engineering student will need to be familiar in his subsequent career. The soundness of this principle is affirmed by so able a chemist as Professor Meldola, who, in an introduction to the book, says: "The fundamental principles of chemical science can be developed as philosophically from the study of what may be called 'engineering' materials as from those made familiar through the multitudes of existing text-books, and chosen because of the facility with which they can be manipulated by the student so as to bring out the desired general principles. It certainly can be claimed as a matter of experience that such treatment is much more successful in arousing the interest and fixing the attention of the student."

A feature of the book which will appea especially to those who find the difficulty of time a pressing one is the arrangement of the

The Abbey of St. Mary, Croxden, Staffordshire. Plan after Excavations.

matter in such a way that the student can choose between three courses of varying length to suit the time at his disposal without destroying the consecutive character of the experiments. Building students who can command time to work through the programme will find some sections of value to them in their work, but the book is written primarily for engineers, and to them it can be warmly recommended.

House Painting and Decoration: A Popular Guide. By Arthur Seymour Jennings. (London: Thomas Tofts. Pp. 182. 2s. net.)

THIS is a small popular guide on painting and kindred works for the use of small house owners and tenants or of farmers and works' managers who desire from time to time to indulge in a little decorative renovation without employing a professional painter; thus while it will be welcomed by one class of citizens it will be deplored by another. The book covers all the subjects on which the amateur decorator is likely to seek information. Brushes, materials, painting on old and new work and on different materials, limewhiting, whitewashing, paperhanging, enamelling, graining, staining, etc., and it is almost entirely free from technical language. Directions are given in a clear and practical way, and the book should find a good public.

Small Water Supplies: For the use of Engineers, Estate Agents, and Owners of Country Property. By F. NOËL TAYLOR, C.E. (London: B. T. Batsford. Pp. 174. 6s. net.)

THIS is an outline treatise on the subject of water supplies to country houses, and will prove a good friend to the engineering student and to the country gentleman or his agent. Mr. Taylor has dealt with his subject in a broad and practical way. Commencing with a short investigation into the causes of impurity in water and simple means of testing, he then deals with the several sources of supply, devoting considerable space to wells and well sinking. Hydraulic rams, and the principal types of pumps, the methods of water storage and distribution, and the calculation of the flow of water through pipes and the strength of retaining walls, etc., are adequately described, and some notes are included in an appendix on the causes and cure of noises in pipes. Mr. Taylor refers in his Preface to the need which he himself experienced in his early professional life of some such guide as that which he has now endeavoured to provide, and there can be no doubt that his book will prove very helpful to a large number who feel the same need to-day.

BOOK RECEIVED.

THE THEORY AND PRACTICE OF HEATING AND VENTILATION. By A. H. Barker. B.Sc., B.A. (Lond.). (London: The Carton Press.)

CORRESPONDENCE.

The R.I.B.A. and Registration.

SIR,—Messrs. Cross and Hubbard's letter in your issue of the 26th ult. is, to my mind, deplorable. The very fact that the Royal Institute of British Architects' Council went to such lengths as to negotiate a fusion with the Society of Architects, a body whose main justification for existence is its original and persistent advocacy of Registration, proves the reverse of "apathy or indifference" on the Council's part with respect to this great question. It is true that these efforts were futile, but this was owing to the inherent difficulties of amalgamation and to the very faulty principles adopted in the drafting of the headings of the Bill incorporated in the scheme laid before the general meeting on January 8 last. Both these gentlemen have been on the Royal Institute of British Architects' Council and its Registration Committee, and presumably assisted in drafting and acquiesced in this scheme, which, in spite of a consensus of opinion in favour of the principles of Registration, was rejected by the meeting.

Messrs. Cross and Hubbard now repudiate the policy adopted by the Royal Institute of British Architects during the past five years. That policy was dictated first of all by the Registration Commission or "Jury" which after taking exhaustive and impartial evidence for and against Registration, reported, if my memory serves me: -

(1) That the members of the Royal Institute of British Architects must bear a better numerical proportion to the whole profession before it could effectively appeal to Parliament for statutory protection; and (2) that unless its examinations were controlled by its own Council and not by a General Registration Council representing other important examining bodies—such as the Universities—its principal prerogative as an Art society would be likely to be impaired. I believe Messrs. Cross and Hubbard heartily approved the report and recommendations of this Commission upon which all the Institute's subsequent policy has been founded. They now announce that they repudiate that policy which has, at any rate, been effective in approximately doubting its membership!

Reforms, Sir, so great and complicated as Registration can only be realised by tackling the acknowledged difficulties at close quarters. The Institution of Civil Engineers and the Surveyors' Institution must be approached and their concurrence gained by clauses in the draft Bill safeguarding their interests.

I am convinced that the adoption of a tentative and experimental procedure on the part of the Royal Institute of British Architects has been a wise one, and I deplore the fact that those who have shared in its counsels and are jointly responsible for its work should now charge it with apathy, incompetence, and self-seeking. Such an attack does not contribute to the end we have in view, nor to the dignity of our Institute. W. H. SETH-SMITH.

A Clean Slate.

SIR,—You have been kind enough to publish one or two letters from us bearing both directly and indirectly upon the vital subject of Registration.

Some of our friends think that we have perhaps expressed ourselves more strongly than the circumstances warrant; but, to our minds, when we review the paucity of the results attained by the Institute after some five years' consideration, we are forced to the conclusion that the present serious position can only be satisfactorily dealt with by administering a drastic remedy.

The Institute, after much labour, has obtained a revision of its Charter and By-laws so as to make it possible for the Society of Architects to be incorporated with the Institute. This labour has had a futile result, as the Institute, by a large majority, has now absolutely declined to sanction the incorporation of the Society. In fact, the compromise which was made between the Registrationists and Anti-Registrationists has completely broken down, as was almost inevitable from its very inception.

No great cause has ever been won without a corresponding expenditure of energy, and we hope that the vast majority of the members of the Institute, who have the cause of Registration at heart, will not be discouraged by the fact that there is absolutely nothing to show for the immense amount of time which has been expended upon it.

Now is the opportunity to rub out the faint scratchings upon the slate which are generally unintelligible. What is wanted is a clean slate—on this should be mapped out in clear and unmistakable lines a programme framed to satisfy the members of the Institute as well as all others whose claims are properly entitled to consideration.

There is no getting away from the fact that the combined wisdom of the members of the Institute must in the end evolve the only workable policy, and it seems to us that there is no other way of obtaining this combined wisdom than by holding a series of general meetings in which provincial members, who carry on their work under greater difficulties than their London brethren, are well represented. By this method clear and unmistakable lines may be mapped out on a clean slate, and then, and then only, will be the time for Committees to be formed in order to give effect to the policy of the general body.

A. W. S. CROSS.
GEORGE HUBBARD.

"The Modern Bricklayer and His Work."

SIR,—You invite your readers' remarks on the subject-heading quoted above, and I would like to preface my remarks by the following excerpt from a little book, now out of print but to be found in the Patents Office Library:—

"Bricklaying is an art manual by which two or more bricks are made to adhere as if they were one brick."

The definition is about as tersely put as it very well could be, and it should be borne in mind when we ask the recurrent questions:—"How many bricks should a bricklayer lay in a day?" "Can a bricklayer lay 1,000 in a day?" and so on. These questions would then be qualified by the added words—or the thought of them—if the 1,000 bricks are "made to adhere as if they were one brick."

If the question were a few times put in this way one doubts whether it would ever again be asked—at least, not in the unqualified ways in which it is now asked.

Every architect, builder, and quantity surveyor knows very well that, taking one job with another, day in and day out, that 1,000 bricks cannot be laid in a working day of nine hours—*i.e.*, laid to comply with the written requirements of an architect's specification.

At the same time, there are instances in which the 1,000 bricks a day are exceeded, but the instances are abnormal, such as in footings very thick walls, and scamped work.

I will now quote from your article, giving the experience and observations of some of your previous correspondents:

"One says that the men will not lay more than 300 bricks a day, unless you watch them.

"Others concur that 500 is the usual daily average." "One has a special man who can lay 1,500 in a day."

"Two bricklayers dispose of 7,500 bricks in eight hours while building a party-wall."

To dispute the accuracy of the last statement would seem unnecessary. We will only say that one should be given the thickness of the party-wall; and, at the same time, point out that party-walls generally have flues and fire places, which absorb some time in forming, also chimney breasts on both sides of the wall, and that each chimney-breast has four plumbing places, the number of plumbing places adding considerably to the cost of labour, as every quantity surveyor and estimator knows.

It is not possible to make a statement as to how many bricks a man can or should lay in a day that will fit into all conditions in building, for the conditions are so varied. The quantity surveyor is aware of this, and in "taking off" allows so many rods of brick work, adding all labours.

The writer of this letter, when a builder's general foreman, working under what he conceived to be the best management, could not on an average (various thicknesses of wall) get more than 600 bricks laid in a day of nine hours, laid to comply with an architect's specification.

The present writer finds himself unable to agree with the experience of a previous correspondent, who depreciates the brickwork executed to-day by comparison with the brick work executed "sixty years ago," as seen in the works of demolition.

Sixty years ago lands us in the reign of stucco—a period when exterior wall surfaces were Portland cement stuccoed, the interior surfaces plastered, and the walls themselves often built of inferior bricks, now chiefly confined to the trade of the speculating builder. One does not dispute that some good brickwork was also done in that period.

But the examples of what was then called ornamental brickwork were so few within the metropolitan area that the building known as the Philological Schools, Marylebone road, was cited as a good example of brickwork in the current literature of a date subsequent to six years ago. The only distinguishing feature about this building is a judicious use of polychrome bricks in the facings; there is the entire absence of cut brickwork.

Your contributor describes the modern bricklayer's method of building a wall, again the way of depreciating present-day work with that of sixty years ago. Given a competent builder's foreman and a clerk of works who knew and was determined to do his work, such a method would find no tolerance.

I don't know whether the same author objects *in toto* to "grouting." Both the bricklayer and the mason must get his facework in alignment, and to do this it is not always practicable to put up the "perpend" joints in full depth of the stone or brick facing, and grouting or flushing is subsequently resorted to, with no detriment to the stone or brick.

In obtaining solidly-built walls the best and most economical method is to lay the outside course of brickwork (or stone, as the case may be) on the interior and exterior face,

then, by the process known to bricklayers as "larrying up," draw up the vertical joints between each brick laid full of mortar, so that they (the bricks) are "made to adhere as if they were one brick."

But the stuccoed front with its repeating blocks (jointings) of equal size in simulation of Classic architecture—with its walls built of "place" bricks—is gone, killed by the criticism of such men as William Morris, John Ruskin (never tired of inveighing against the ugliness of their times), and the healthy architectural thought of their earlier days, to be succeeded by the Queen Anne revival, and some first-class terra cotta-faced buildings.

Of trade unions—*qua* trade unions—the writer has nothing to say.

Your article deals largely with this. But one cannot help but notice the similarity of thought expressed by you and by Professor Thorold Rogers (1823-1890), when dealing with this subject:—

"I know nothing," says Rogers, "which would exalt the reputation and justify the action of trade combinations more than the establishment of a rule that members of such unions would denounce and expose dishonest scamping work, and protect those of their order who may suffer ill-usage or wrong-doing for having reported and checked such nefarious practices.

As yet the rules of trade unions are principally confined to the process of bettering the whole class. Hereafter they will, or should, extend towards purifying the class and making it a potent instrument for the moral and material advancement of all. Other professions exclude, either formally or informally, misbehaving, disreputable, or incompetent persons from their ranks. It cannot be doubted that in time to come artisans and labourers will elaborate those necessary police regulations, by which they will increase the usefulness, elevate the reputation, and cultivate the moral tone of those who ply the craft whose interests they seek to serve, and whose characters they ought scrupulously to maintain."

F. WALKER,
Clerk of Works.

Ideal Homes and Ideal Lighting.

SIR,—The Ideal Home Exhibition has just closed its doors, and before the memory of it has passed completely away I should like to draw attention to a very serious omission on the part of the organisers.

In regard to the interior decoration and furnishing of our homes, and the provision of sundry labour-saving conveniences, the Ideal Home has taught us many useful and sadly-needed lessons.

But amongst the numerous experts who must have been consulted in the arrangement of the house it is perfectly obvious that there was no lighting engineer. As a consequence, the lighting arrangements comprise quite an interesting museum of out-of-date, ugly, and inefficient accessories.

The "glare" accentuating conic opal shade was in evidence in the servants' quarters, while the reception and bedroom electric-light fittings were equipped with ornamental glass shades of which the best that can be said is that they do not absorb more than 50 per cent. of the available light.

What in the world could the organisers have been thinking of to light the Ideal Home by such hopelessly discredited means?

There are now available a number of types of reflector, scientifically designed to control and redirect the light in useful directions.

Why was no advantage taken of this fact?

Or another method of lighting which might have been utilised was the one employed for the illumination of the Electrical Hall at the Smoke Abatement Exhibition. The illumination was obtained indirectly by diffuse reflection from the ceiling, and the effect was delightfully mellow and restful. The fittings appeared to consist of ornamental metal bowls, suspended from the ceiling, and containing reflectors and lamps. These latter were, of course, invisible. Light rays would at first thrown on to the ceiling, and from there evenly distributed over the room. Such a system, with its total absence of eye-straining glare, struck me as being peculiarly suitable for the illumination of the Ideal Home. However, the gravamen of the present charge is not that the organisers of the Home omitted to employ a system which I personally might recommend, but that they apparently failed altogether to appreciate the importance of lighting in the domestic scheme, and consequently did not trouble to obtain competent advice on the matter at all.

HAROLD G. GOODY.

Pompeian Decoration.

SIR,—On reading the criticism of Mr. R. A. Briggs's book in your issue for April 26 it struck me that your reviewer was very unfair on a work which has otherwise been so well received.

In these days when an architect's calling is so much complicated with the multifarious duties connected with his profession it is difficult to find leisure for the production of artistic works such as this, in which he may be interested, besides the difficulty of obtaining a sympathetic publisher.

The profession is always ready to welcome an interesting work from one of its members, especially as in the case of Mr. Briggs, when his endeavours have been to place before it in a more truthful manner a few examples illustrating some of the beautiful fragments of decoration discovered at Pompeii.

It has been already stated that the number of works and pamphlets on the subject amount to about 500, and the publication of yet another, by the aid of the three-colour process, is a distinct advancement, being, I gather, all that Mr. Briggs claims.

The details, in my opinion, are not poorly drawn and feeble, but quite the contrary. Certain subjects in white marble must be delicately drawn, and especially when seen by the artist in the strong reflected light of an Italian sky.

During the present year I understand fresh beauties have been revealed by the excavators, and I hope that Mr. Briggs will return to Pompeii at no distant date and give us a further series of his charming three-colour reproductions.

AND. N. PRENTICE.

The Town Planning Conference.

SIR,—Will you allow me to correct the report of the Town Planning Conference which appears in your edition of May 3, as far as my remarks are concerned?

A delegate from another town asked whether Crown lands could be included in the town-planning schemes, and I stated that in Portsmouth we had been told by the War Department representatives that they were exempt from the scheme, and that they had already established that scheme. In these circumstances I advised the inquirer to try to come to some mutual arrangement with regard to the Crown lands within his district.

I could not have said that "a large number of small, ugly, and badly-planned houses had sprung up upon the land," as, as a matter of fact, the land has not yet been laid out as a building estate, the plans only of the roads having been deposited.

The whole question of the Crown lands seems to be a matter for mutual arrangement rather than compulsory powers under the Act, and this is the only point which I made at the Conference.

ARTHUR W. WARD
(Borough Engineer).

Lighting by Air-Gas.

SIR,—Under the heading, "Monthly Review of Engineering," in your issue of April 26, a comparison is made as to the relative cost of lighting by acetylene and petrol air-gas. It is stated that the cost of maintaining a 100-candle-power light for ten hours with acetylene is 1s. 3d. and with air-gas 1½d.

This statement is absolutely incorrect, as will be seen by the simplest calculation.

One pound of good quality carbide at 1½d. per pound produces 5 cubic ft. of acetylene.

An ordinary 45-candle-power burner consumes 1 cubic ft. per hour, or 10 cubic ft. in ten hours.

Therefore, the cost of maintaining a 100-candle-power light for ten hours with acetylene is 6d., not 1s. 3d.

By using an efficient mantle this amount can be reduced by more than half, bringing the cost down to somewhere about 3d.

In comparing the two systems of lighting, acetylene and air-gas, there are other considerations of importance besides the actual cost of the carbide or the petrol. There is the question of plant, piping, burners, fittings (pendants, brackets, globes, etc.), safety, health, convenience, and general appearance.

In every case acetylene possesses undeniable advantages over petrol air-gas, excepting perhaps in the case of fittings, where the cost will be the same in each case.

With regard to another statement in the same article, "That the first cost and upkeep of an acetylene installation rendered its general adoption impracticable," I would simply refer the writer to the fact that the consumption of carbide in Great Britain for the year 1903 was 3,000 tons, whereas in 1911 the total consumption reached 20,000 tons, a great percentage of this being for lighting purposes.

I am sure a journal of the standing of the *Builder* would not wish to mislead its numerous readers on this or any matter, and I therefore hope my letter will be published without delay.

ACETYLENE PUBLICITY, LTD.
VICTOR D. DUVAL (Manager).

[**** A letter to the same purport has been received from the Thorn and Hoddle Acetylene Company, Ltd. The question of the production of any gas depends mainly upon the present market price of the material from which the gas is produced. The price of petrol varies according to the market, and similarly with calcium carbide used for acetylene lighting. The table in the article was (as stated) one issued by a particular firm, and, of course, should be modified according to circumstances. In it petrol was assumed to cost 1s. 3d. per gallon, a fair average price. A good quality carbide costs 3d. per pound for a 1 cwt. drum. As 1 lb. of carbide produces 5 cubic ft. of gas, and 100-candle-power light consumes 2·22 cubic ft. of gas per hour, the cost of maintaining such a light for ten hours is 1s. 1d. The discrepancy complained of seems to be based on the price quoted for carbide, which is given by our correspondent as half that at which it is offered to the ordinary purchaser. It may be admitted that modern improvements in acetylene plant have overcome the more serious objections to it, as we propose to show in an article on the subject at present in hand.—ED.]

INTERCOMMUNICATION COLUMN.

Projecting Sign.

SIR,—A certain local authority have put sect. 91 of the Public Health Act (Amendment Act), 1907 (Sky signs), into force, and three years ago compelled a certain hotel proprietor to take out a licence for a projecting wrought-iron sign 4 ft. out from the wall and about 15 ft. high from ground level; and as the licence expires at the end of three years, and by the Act is not allowed to be renewed, the local authority have served the owner with notice to remove the sign. The owner is advised that such a sign does not come under the Act relating to sky-signs. Can the local authority take down the sign or enforce the penalty under the Act?

ENQUIRER.

THE ROYAL SANITARY INSTITUTE.

At an examination in Sanitary Science as applied to Buildings and Public Works, held in London on April 26 and 27, twenty-three candidates presented themselves, and thirteen were granted certificates, *i.e.*—D. J. Bell, Millbank; B. W. Brooman, Tunbridge Wells; A. H. Carter, Westminster; W. J. Dorey, Brixton; G. C. Headley, Hertford; F. S. Jasper, Bayswater; W. W. S. King, Wimbledon; Tulsi Dass Kochhar, South Kensington; W. Mitchell, Upper Norwood; T. E. Moore, Welwyn; J. W. Stevens, Feltham; A. C. Tomlinson, Palmers Green; A. Venkataraman, Kensington.

At an examination in School Hygiene, including Elementary Physiology, held in London on April 26 and 27, ten candidates presented themselves for the certificate, and seven were granted certificates. At an examination for Inspectors of Nuisances, held in London on April 26 and 27, sixty-four candidates presented themselves, and thirty-one candidates were certified as regards their sanitary knowledge competent to discharge the duties of Inspector of Nuisances under the Public Health Act, 1875.

EDITORIAL SUMMARY.

"Contemporary Architecture at the A.A." is the title of the leading article.

The second article deals with the domestic work shown in the Architectural Room at the Royal Academy Exhibition (p. 536).

In "Notes" columns (p. 537) will be found observations on: "Danish Art at Brighton"; "Mural Decoration"; "Street Name-Plates"; "Regent's Quadrant Competition"; "Protection of Monuments"; Hospital Criticism"; "The Prevention of Vandalism."

A *résumé* of the annual Report of the Council of the Royal Institute of British Architects is given on p. 537.

In "Architectural Societies" (p. 541) short notices of the following will be found: "Sheffield Society of Architects"; "Guild of Architects' Assistants"; "The Architectural Association."

Some notes on the York Elementary School Competition, with plans of the premiated designs, appear on p. 542.

Book notices (p. 545) include: "The Abbey of St. Mary, Croxden"; "Practical Chemistry for Engineering Students"; "House Painting and Decoration"; "Small Water Supplies."

In Correspondence columns (p. 546) are letters on: "The R.I.B.A. and Registration"; "A Clean Slate"; "The Modern Bricklayer and His Work"; "Ideal Homes and Ideal Lighting"; "Pompeian Decoration"; "The Town Planning Conference"; "Lighting by Air-Gas."

The Monthly Review of Construction (p. 549) is entirely devoted to an illustrated article on the Adelphi Hotel, Liverpool.

The Building Trade Section (p. 555) includes: "Builders and Strikes"; "The Mediæval Plumber"; "Labour in the Building Trade"; "Projected New Buildings in the Provinces"; "Applications under the 1894 Building Acts," etc.

In Legal Column (p. 558) will be found notes on: "Workmen's Compensation."

In Law Reports (p. 558) will be found short reports of the following cases: "Ashwell & Nesbitt, Ltd. *v.* Allen & Co."—validity of architect's certificate; "The King *v.* The Tribunal of Appeal (*ex parte* the London County Council)."

MEETINGS.

SATURDAY, MAY 11.

The Society of Engineers (Incorporated). Annual dinner at the Criterion Restaurant, Piccadilly-circus, W., 6.30 for 7 p.m. Mr. John Kennedy, the President, will take the chair.

The Institution of Municipal and County Engineers. Midland District meeting to be held at Nuneaton.

Northern Architectural Association.—A meeting at Armstrong College, Newcastle, when the new School of Art will be visited. 3 p.m.

MONDAY, MAY 13.

Royal Society of Arts, Health Lectures.—Capt. H. R. Sankey, R.E., on "Heavy Oil Engines" III. 8 p.m.

The Incorporated Clerks of Works Association (Carpenters' and Londesborough). Paper by Mr. Harvey Piper, "Round and Round St. Paul's." 8 p.m.

The Surveyors' Institution. Adjourned discussion on Mr. G. Taylor Loban's paper on "Some Principles in the Valuation of Land and Buildings" will be continued. 8 p.m.

WEDNESDAY, MAY 15.

Royal Society of Arts.—Mr. E. K. Scott, A.M.Inst.C.E., on "The Manufacture of Nitrates from the Atmosphere." Sir William Ramsay, K.C.B., will preside. 8 p.m.

THURSDAY, MAY 16.

Royal Society of Public Health Session. Mr. N. Priestley on "Indian Railways." 4.30 p.m.

Institution of Electrical Engineers.—Annual general meeting. 7.45 p.m. Ordinary general meeting. 8.30 p.m.

FRIDAY, MAY 17.

Junior Institution of Engineers. Visit to the works of the Orchestrelle Company at Higes. 3 p.m. At 39, Victoria-street, Westminster. Mr. G. C. Allingham on "Storage Battery Engineering." 8 p.m.

SATURDAY, MAY 18.

Edinburgh Architectural Association.—Visit to Raith, Kirkcaldy.

ARCHÆOLOGICAL SOCIETIES.

Surrey Archæological Society.

The fifty-seventh annual meeting of this Society was held at the Town Hall, Guildford, on Saturday, April 20. Alderman F. F. Smallpeice, J.P., presided, supported by the Mayor of Guildford (Mr. W. T. Patrick), Sir John Watney, Sir Edward Brabrook, Rev. A. P. Glyn, Rev. T. E. Cooper, Rev. H. M. Harke, Colonel Sykes, Dr. H. M. Chester, Dr. Finny, Dr. Gardner, Messrs. Eastwood, H. E. Malden, Mill Stephenson, Ralph Nevill, G. H. White, P. Woods, A. J. Style, M. Giuseppi, R. Garraway Rice, Hilary Jenkinson (Hon. Secretary), H. F. Elsley (Librarian), and many others, ladies and gentlemen, members and visitors.

The Mayor welcomed the Society to Guildford, which was rich in archæological associations, and hoped that they would derive pleasure and instruction from their visit. The Report stated that the Council of the Society had much pleasure in submitting this, the fifty-seventh annual Report and Statement of Accounts for the year ending December, 1911. The annual excursion was held July 13, 1911, the places visited being Guildford, Shere, and Albury. The Council thanked all who helped to make that meeting a success, and the Master of the Charterhouse (the Rev. Gerald S. Davies) for his kind invitation to the Charterhouse on the afternoon of Saturday, October 14. The annual volume for the year 1910 (Volume 24) contains valuable papers by Mr. R. A. Roberts, Dr. Eric Gardner, Mr. P. M. Johnston, F.S.A., Miss Ethel Stokes, Dr. J. M. Hobson, Mr. F. Lasham, and Mr. C. T. Davis. The annual volume for the past year (Volume 25) is now in hand. The lengthy process of editing for the Press the general index to the first twenty volumes of the Society's Collections is still proceeding, and the manner of its publication, an expensive matter, has been engaging the attention of the Council, and will be the subject of a proposition to be made by it at a special general meeting immediately following the annual meeting. The question of the preservation of threatened antiquities has been before the Council in many forms during the past year. Quite the most serious danger, though public attention was not strongly drawn to it, was that threatening St. George's-hill British camp, at Weybridge. This hill has upon it an exceptionally fine early British camp, the interest and importance of which (described in last year's volume of the Society's Collections) are enhanced by the very numerous finds of pottery and weapons made recently in its neighbourhood. Building operations, now inevitable there, at one time threatened the most interesting features of the hill, but the Council is glad to report that, thanks to the constant efforts of the Society's local Secretary, Dr. Gardner, and to the ready acquiescence of the new owners, the worst dangers have been averted. A case of danger to antiquities which has had a larger share of public attention is that touching the old houses in the Farnham-road, Guildford. With regard to this the Council has little to add to the remarks on the same subject made in a former Report. This matter, however, occupied considerable space in some of the daily papers, and has served to attract to the whole question the attention of the Surrey County Council, which has now elected a Committee, upon which this Society is duly represented, to consider the question of the preservation of Surrey antiquities. Partly in connexion with this action of the County Council, and partly in response to an appeal for information made by Sir Schomberg McDonnell, of H.M. Office of Works, the Council has decided to undertake a schedule, arranged alphabetically under parishes, of all Surrey antiquities of importance. It is hoped that this list, which will be printed during the year and issued to members of this Society, may prove to be of considerable value. Another danger, one of a different kind, may be referred to in connexion with the recent presentation of a large number of private deeds of the XVIIth and XVIIIth centuries, for which the Council has to thank Lord Grantley. It cannot be too strongly urged upon members that such deeds, even though they be of comparatively late date, will be in the future, if they are not now, a principal source of information upon local history; that under the present requirements for the proving of title their legal value is small: that they tend, consequently, either to be ill-kept and neglected, or to be so separated for the purpose of collectors as to lose a large part of their historical value; and that in the absence of any official provision the County Archæological Society is obviously the proper custodian for them. Some account of Lord Grantley's gift, and of other deeds in the possession of the Society, will be given shortly in the Society's Collections. Other additions to the libra and museum include a set of photograph negatives and prints of a collection of wate colour paintings of Surrey churches and oth buildings made at the beginning of the XIX century. The Council is much indebted to t owner, Mr. Edgar Sharpe, of Reigate, f permission to photograph this valuable colle tion. The library has also profited by a gi from Miss Smiles of twenty-four volumes of t *Genealogist*, and by the deposit, upon loa of a number of volumes of *Archæologia*, with t general index volume, by Mr. Ralph Nevi F.S.A. The formal opening of the ne museum, control of which is shared by th Society with the Town Council of Guildfor took place during the year. This Socie numbers at present 491 members. It h gained during the past year thirty-three, a has lost by resignation twenty, and by dea nine members. Among the last-mention the Council has particularly to deplore tw old members and Vice-Presidents, the la Sir William Grantham and the late Earl Onslow. The present Earl of Onslow, Viscount Cranley, who was already a memb of the Society, has accepted the position Vice-President in succession to his fathe The members of Council who retired by rotatio were re-elected, and also the Hon. Auditor Votes of thanks were passed to the Mayor f use of Guildford Town Hall and for hospitalit and to Alderman Smallpeice, J.P., for presidin

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the Lond County Council was held on Tuesday in t County Hall, Spring-gardens, S.W., Lo Cheylesmore, Chairman, presiding.

Loans.—The Finance Committee had loans to local bodies to report.

Embankment.—The Highways Committ reported that it was desirable to renew considerable area of tar-macadam paving the Victoria-embankment, and recommend that the work should be carried out by t Trinidad Lake Asphalte Paving Compan Ltd., and the Roadamant Company, Ltd. T estimated cost of the work is 1,690*l.*

Chief Fire Station.—It is proposed that portion of the office block, recreation-room, a basement at the chief station of the Fi Brigade be wired and fitted for electric lighti at an estimated cost of 70*l.*

Perry-vale Fire Station.—The paving of t run-in at this station and portion of the ya is in need of renewal, and is to be repaved wi granite setts and ironstone tiles at a cost about 138*l.* 17*s.*

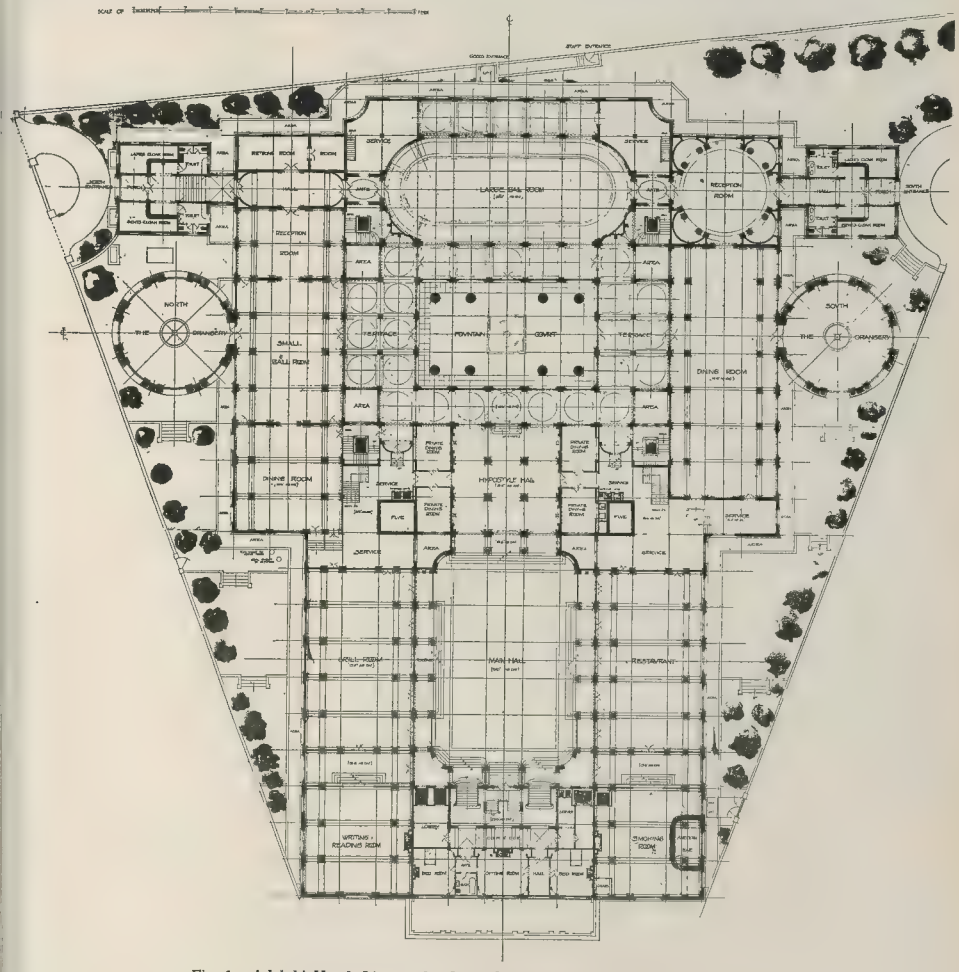

Fig. 1. Adelphi Hotel, Liverpool. Ground Floor: Plan of Complete Scheme.
Mr. R. Frank Atkinson, F.R.I.B.A., Architect.

ADELPHI HOTEL EXTENSION, LIVERPOOL.—I.

FOR many years past railway travellers have been familiar with the admirable hotels provided in various places on Midland Railway system and with the ressive introduction of new ideals in hotel- gn and equipment by the hotels depart- t of the same company, as evidenced, for ance, by the remodelling of the Queen's el, Leeds, and the building of the Midland el, Manchester.

he latest example of the enterprise displayed he Midland Railway in the direction indi- d is afforded by the completion of the first of the scheme prepared by Mr. R. Frank nson, F.R.I.B.A., for the reconstruction of Adelphi Hotel, Liverpool.

e are indebted to Mr. Atkinson for permis- to reproduce the accompanying perspective for giving us various particulars of the s so far completed.

e original hotel on the site, facing Ranelagh- , and bounded on either side by Copperas- and Brownlow-hill, was built in 1828, and, as our readers may remember, is mentioned by Charles Dickens in his *American Notes*.

That structure was rebuilt in 1876, when the new hotel was considered to be one of the best establishments of its class in Great Britain, and many visitors would still consider it adequate for all requirements. But owing to modern developments and ideas affecting the question of hotel accommodation, and the need of providing for larger numbers of visitors than formerly, the railway company found it necessary to extend the hotel considerably. With this object they acquired a large area of land behind the building of 1876, the land thus acquired, together with the old hotel property, forming an island site of 2¼ acres approximately. This site was intersected by three streets which have now been closed and included in the area, but an equivalent area has been deducted from the new site and added to the bordering streets, thus permitting the boundary lines to be straightened, the streets widened, and the surroundings generally improved.

In considering the question of enlarging the hotel attention was wisely given to the ultimate extent of building and rebuilding operations. Therefore the designs for the large block that has been erected as an addition to the original part of the hotel were included in a comprehensive scheme, providing for further extension at the back and the rebuilding of the existing hotel at the front. Thus all the apartments, halls, and corridors in the first portion of the new hotel have been planned so that they will be in every way appropriate to the arrangement that will be established when the time has come for the final realisation of the general project.

The scope of the latter is made clear by the perspective, with plan and longitudinal section, reproduced as one of our plates, and more fully by the complete ground-floor plan in Fig. 1.

The task of planning the scheme as a whole presented considerable difficulty, as will be appreciated when it is stated that the rise in the side streets from Ranelagh-place to the back of the site is some 20 ft., that the new ground

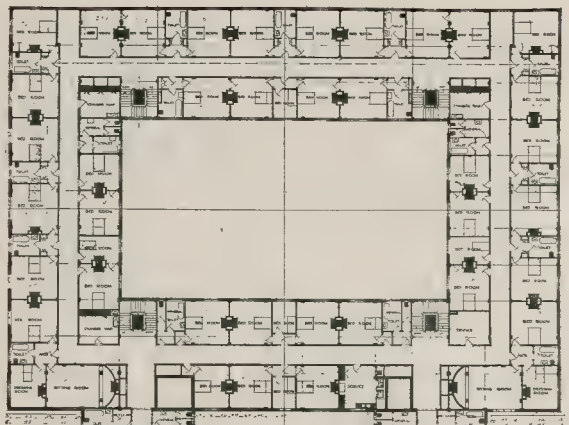

Fig. 2. Second Floor: Plan of Complete Scheme.

floor is only about 18 in. below the first floor of the old hotel, and that the first floor of the new hotel is about 18 in. above the third floor of the old hotel.

However, this rise of the land has not resulted in any change of level in the main features of the exterior, as it will be seen by the longitudinal section that all horizontal lines are maintained, with the exception of the terraces, which follo by stepping to some extent the natural rise the land.

The necessary adjustment of interior flo arrangements has been effected without inco venient results, and by reference to the lon tudinal section it will be realised that the leve of the ground floor have been so treated in t architectural scheme as to produce very fi effects.

As indicated by Fig. 1, the lines of t building do not follow those of the stre frontages in the usual manner, which had be adopted in the case of the old hotel, but bo blocks of the building are set four-square on central axis, being the bisection of the tw converging side streets on either hand of t irregular site, the various spaces so form around the hotel being utilised for the co struction of orangeries, porches, approache terraces, and gardens, which will add materia to the convenience and pleasant appearan of the hotel.

The whole scheme embodies planning on t broadest and most simple lines, everythi being laid out on squares of 14 ft. 3 in. fro centre to centre. All the principal rooms ha floor areas which are multiples of this un dimension, the adoption of the system co ducing to great simplicity, uniformity, and ea working, and, as pointed out later, it very mu simplified the design and construction of t steel frame forming the skeleton of the blo already erected. The same point is illustrat by the second-floor plan given in Fig. 2.

Although in the complete project there really only one building, this may for all pra tical purposes be regarded as consisting of tw blocks, the site of the front block being at pres occupied by the old hotel, while the part of t rear block lately built has been temporari arranged so that it can be worked as a comple hotel during the rebuilding of the old hotel, wi or without the hinder part, which will be adde when occasion may demand.

Before discussing the details of the wo recently executed we will take a brief surve of the hotel as foreshadowed by the gener project.

The front block measures about 140 ft. wi by 160 ft. from front to back, and includes ni stories in all. The main entrance gives adm sion to a spacious hall, whence two short fligh of steps lead into the main hall, a noble apar ment 85 ft. long by 56 ft. wide, without takin into account the bordering terraces. The hall lighted from the roof, and occupies the botto of a large light court surrounded on all sides b the upper stories of the building. On eith side of the main hall are the restaurant and gri room respectively, the former communicati

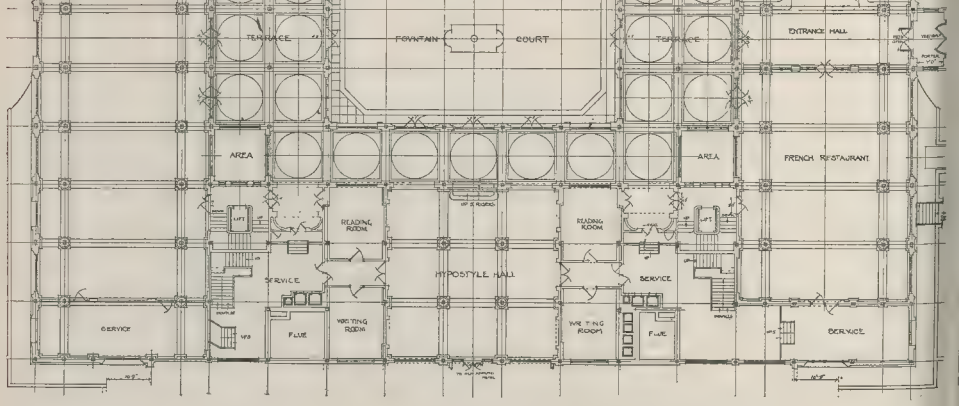

Fig. 3. Ground Floor: Plan of Portion Completed. (Temporary Arrangement.)

n a smoking-room, and the latter with a ing and reading room.
t the farther end of the hall a broad flight of s communicates with the hypostyle hall, the apartment in the rear block of the hotel.
rom this hall the visitor passes to a series of aces with vaulted roofing and surrounding a e open area known as the fountain court. ve the terraces and court is a light court, nd which are the upper stories of the ding.
n each side of the hypostyle hall are service- ns in direct communication with the kitchens w, their central situation rendering them ally convenient for the needs of the front and k portions of the hotel.
eyond the fountain court is the large ball- n, an apartment of fine proportions, with icircular ends, and a terrace along the outer of the building.
t the right hand of the court and ballroom a reception-room of circular form with four ves and a spacious dining-room. The are pavilion, connected by a short corridor h the reception-room, is approached from wnlow-hill by a carriage sweep, and contains k and toilet rooms, in addition to a porch entrance hall. The public dining-room on same side of the building is in communica- with the circular orangery shown on the n.
t the left hand of the large ballroom another are pavilion with an entrance from Copperas- gives access through an entrance hall to the e ballroom and to a reception-room leading the small ballroom, opening in turn into ther dining-room. The small ballroom mmunicates also with an orangery similar to on the opposite front of the hotel.
ven from this brief and incomplete sum- y the reader will be enabled to gather an of the spacious accommodation provided, merely in the various apartments, but also he connected series of halls, terraces, and r spaces extending throughout the building. he grouping of the principal rooms around main hall and fountain court gives a sense penness, space, and light, the vistas from points being long and pleasing, especially e on the main axial lines between north south and east and west.
he foregoing brief description, however, a measure prophetic, because it deals with arrangement of the main floor of the hotel will be when the project of Mr. Atkinson been completely realised.
ttention must now be directed to the portion h has been actually completed, and it should bserved that in this part the temporary ngement adopted to enable the block be employed as a self-contained hotel necessitated the employment of some rooms purposes different from those to which will be put after the front block has been

ig. 3 is a revised ground-floor plan denoting present uses of the various rooms. In e of the south orangery there is a tem- ry entrance from Brownlow-hill, and the ic dining-room has been divided into two s, one providing an entrance hall with the omary auxiliaries, and the other used as rench restaurant. Reading and writing as take the place of the four private dining- as on either side of the hypostyle hall, and he Copperas-hill side of the hotel is one e room to be used as a ballroom, banquet- hall, or grill-room, as occasion may demand. the basement are situated the kitchens, all the necessary auxiliary offices, stores, -room, plate-room, china-rooms, bakery, ants' hall, staff toilet-rooms, engineers' and ers' shops, wine stores, baggage-room, lemen's temporary toilet-room, and other mmodation. On the mezzanine floors on r side of the hypostyle hall are wine- ensing rooms, waiters' dressing-room, and a loir for ladies with attached toilet-room.
he new block measures about 215 ft. wide 115 ft. deep, and comprises nine stories in the total height above street level being ft.
is constructed on the steel skeleton riple, with enclosing masonry walls, which only 14 in. thick from top to bottom, as are carried by steel girders at each floor , and consequently have to support no beyond their own dead weight.
ne exterior walls are of Portland stone, and architectural design is marked by extreme licity, as may be judged by inspection he drawing showing the complete design he exterior.

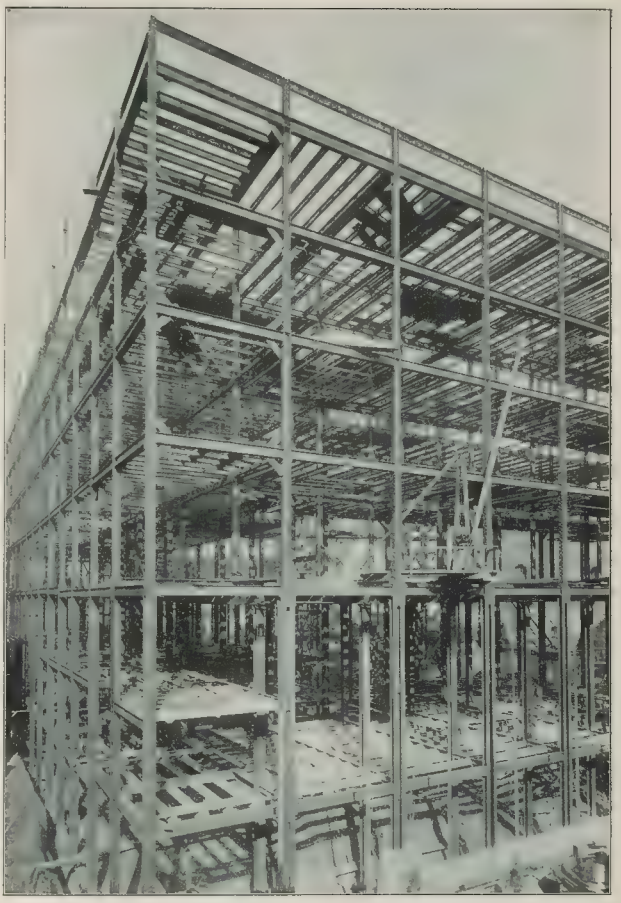

Fig. 4. Adelphi Hotel, Liverpool. Steel Skeleton.

Fig. 4 is from a photograph of the completed skeleton, at the bottom of which may be seen the first courses of the masonry construction.

As may be seen by this view and the half plan of the steelwork at first-floor level (Fig. 5), the lay-out of the building is based on a very simple and practical system of rectangulation. The site of the structure occupies an area divided into 120 squares, represented by fifteen bays in one direction and eight bays in the other direction, each bay having the length of 14 ft. 3 in.

Referring to the half plan of the steelwork, it may be mentioned that the plate girders and some of the compounded girders there shown carry the stanchions in the upper corridor partitions. The chimneys starting at the same level are responsible for the somewhat unsymmetrical arrangement of the girders and transverse beams. Another circumstance affecting the arrangement of some girders projecting below the general ceiling line was the need for compliance with the decorative scheme elaborated by the architect for the treatment of the ground-floor ceilings.

In most instances the stanchions are situated at the intersecting points of the lines of the square floor bays.

The general arrangement is one conducing to economy in respect of the steel construction, one indication of this fact being furnished by the small number of heavy built-up girders in the steel frame.

The largest members of the kind are those at first-floor level, spanning the large areas on the ground floor for the entrance hall, grill-room, hypostyle hall, and other apartments. Sixteen of these girders have the average weight of from 6 to 7 tons each.

It was originally intended that the present fifth floor should constitute a temporary roof, leaving the fifth and sixth stories to be added later, but in accordance with a later decision these stories were completed at the same time as the remainder of the building.

As may be noted by reference to the perspective, the front walls are set back above the fourth story, the actual distance being 4 ft. 9 in. The arrangement for carrying these upper walls and the stanchions embedded in them is such that the ceilings of the room in the fourth story shall be flush and all girders requiring to be encased shall be situated in the partition walls.

False ceilings are suspended under the floors of the lavatories and bathrooms, affording space for plumbers' work and pipes.

The most weighty stanchions are in the exterior walls, being built up of two 9-in. by 7-in. I-beams connected by a 12-in. by 6-in. I-beam, the result being a stanchion of wide H-section.

This form was adopted with the object of keeping the stanchions within the thickness of the enclosing walls, and to make the exterior face of the masonry not less than 4½ in. clear of the steelwork.

Wind bracing is provided at various points in the form of gusset plates acting as knee braces between the shafts of the stanchions and the flanges of the girders supporting the panels of the enclosing walls.

Thanks to the fact that sandstone was encountered at a short depth below surface level, and capable of withstanding with perfect

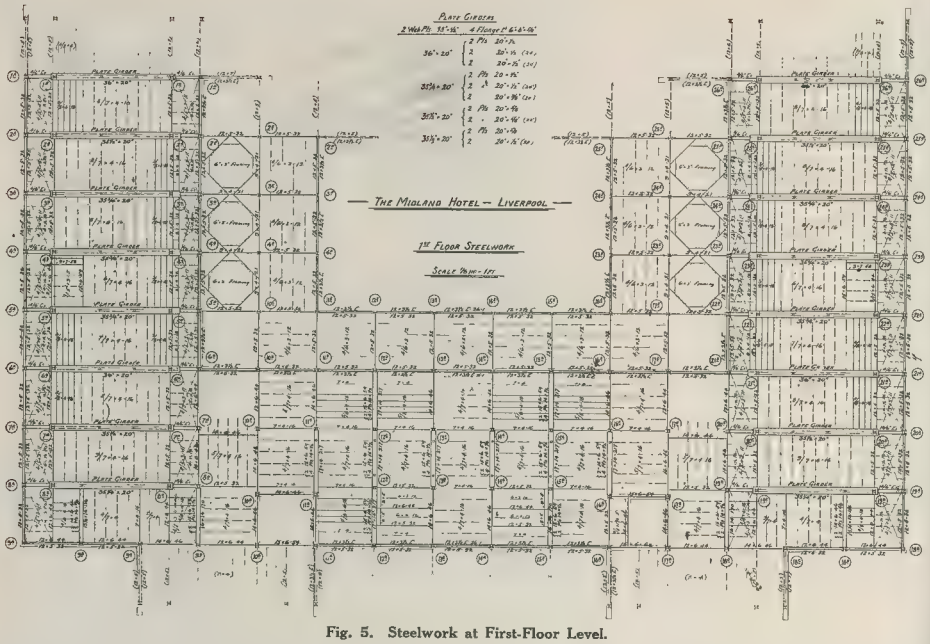

Fig. 5. Steelwork at First-Floor Level.

safety pressures up to 7 tons per square foot, the foundations for the stanchions were of simple character, and formed of grillages, comprising a single tier of I-beams embedded in concrete below the stanchion bases.

The total weight of steel in the new building amounts to 1,770 tons, of which 720 tons, or rather more than 40 per cent. of the whole, is in the form of stanchions.

The amount of work involved in the preparation and erection of the steel frame may be gauged in some measure by the statement that it has required the use of about 230,000 bolts and nuts and 520,000 rivets.

The whole of the steel is of British manufacture, having been supplied and erected by Messrs. Richard Moreland & Son, of London, under the superintendence of Mr. C. V. Childs, A.M.Inst.C.E., who was associated with the architect in the capacity of consulting engineer.

As a safeguard against fire and corrosion the steel frame has been thoroughly protected by concrete and other materials, among which may be mentioned the plaster applied in the decorative work described hereafter.

All the floors are of approved fire-resisting construction, embodying hollow concrete tubes, reducing the dead weight and conducing to the sound-resisting properties of the flooring. The stairways throughout are of fire-resisting construction. The contract for the floors fire-resisting casings, and the hollow partition walls throughout was let to Messrs. B. H. Johnson & Sons, of London.

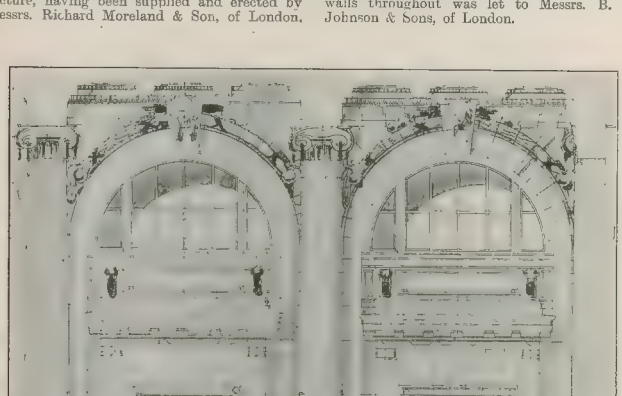

Fig. 6. Hypostyle Hall: Details.

All excavations, drainage, brick and masonwork was carried out by Messrs. W. Thornton Son, of Liverpool, the building contractors.

Bearing in mind the fact that in April, 19 nothing but the bare steel skeleton had be erected, the completion of the building e its complete equipment ready for occupatio in March last is a sufficient testimony to t rapid execution of the work entrusted not onl to the builders, but also to the numerou specialist firms contributing their share t the task of realising the designs of the architec

To deal adequately with the architectur and decorative treatment of the numerou fine apartments, halls, and other spaces in th new hotel would be impossible in an artic such as the present, and we can only attem to give a few brief notes, together with a f typical illustrations of the interior.

In the entrance hall, fountain court, gril room, hypostyle hall, terraces, and corridor on the ground floor, and elsewhere in the build ing, specially selected varieties of marbl have been employed by the architect wi charming effect.

The true purport of the hypostyle ha will not be fully revealed until the entir project has been completed. The hall wi then occupy a central position where its bor rowed lighting and subdued tone will form pleasing contrast to the main hall and fountai court, each directly lighted from the sky. Th fine pillars and general treatment of this ha will help to give that atmosphere of mystery an shade which is so desirable in a large buildin of the kind now under consideration. Th interior is designed in dignified style, executed in English stuc with polished black marb. skirting, base steps, and other details. Th treatment of the hall is shown by Fig. 6, an by one of our plates.

In this hall are some beautifully bronz balustrades, doors, and electric light fittings all specially designed by the architect. Th balustrades and doors, as well as those in th adjoining terrace, were executed by Messr Singer & Sons, of Frome.

The paving of the hypostyle hall is la on a geometrical plan of much artistic mer in white Echaillon and black marbles, and th same treatment is continued on the flooring of the hypostyle hall terrace and the othe terraces in connexion therewith around th fountain court.

The Echaillon marble is of a delicate ligh buff tint, and, although little used so far Great Britain, is very popular among Frenc

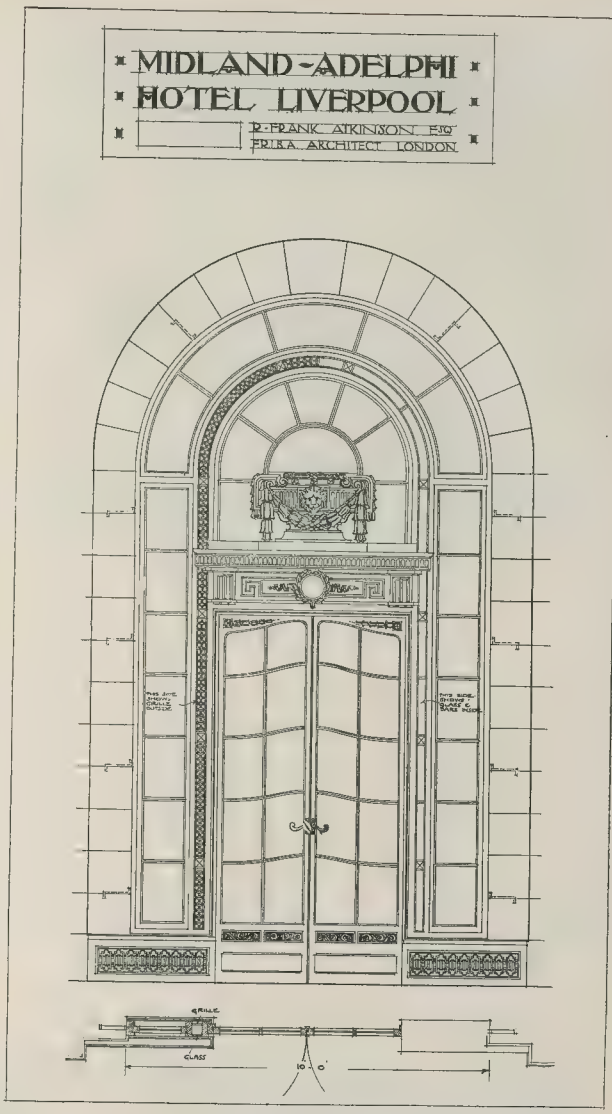

Fig. 7. Typical Window Doorway: Fountain Court.

ects. a well-known building where it be seen being the Opera House, Paris.
ne of the marbles employed came from outh of France, and of the others Brêche is a pink marble of exquisitely soft tone white markings, quarried within the Circle.
corridors and staircases generally are with wall panels executed in delicate tinted white marble with decorative gs and markings of bluish grey. The are bordered by narrow bands of the coloured veined marble known as accia, and finished by a frieze in light marble of a variety hitherto little used hitectural practice. The floors are also ed in marble and carpeted in blue with orders, giving an excellent effect.
the marble work was executed to the s of the architect and under his super- by Messrs. H. T. Jenkins & Son, of y.
French restaurant, occupying a part of ea that will ultimately form the public room of the completed hotel, is treated severely in the Louis XVI. style, the ng being deep cream with mouldings te with appropriate gilding. A view of partment is reproduced as one of our and details are given in Fig. 8. The back- and flat portion of the ceiling panels mauve, the curtains being of camel- d watered silk with woven border in and rose, and the carpet exhibiting a round with blue ribbon design and broad in blue.
ball, banqueting, or grill room is a fine ent in the Empire style, the general tone walls being green of various shades and th the ceiling panels of pale blue. The e of mahogany with appropriate gilding, carpet provided for use when required en and deep gold, the curtains being of reen with gold bordering.
e large columns in this room of vert- Scagliola marble with black bases were y Messrs. Bellman, Ivey, & Carter, Ltd., lon. Each column, with a shaft 17 ft. is formed in one piece and fixed around d concrete cores without showing the ace of a joint. The same material pted for panelling the corresponding in the room.
looring, by Messrs. Morton & Son, is of pended on special springs for dancing, and t so that it can be made rigid when the being used as a banqueting hall or grill-

e middle of the building is the fountain pen to the sky, constituting a cool and retreat in summer-time and providing admission of natural light to the sur- terraces.
alls of the court are built in Portland th some excellently carved masks and and the wide portals are surmounted carved vases. A Hopton-Wood stone alk extends around the grass-plot, in dle of which is a plain lead fountain pton-Wood stone curb.
acious terraces surrounding the foun- t and communicating with the hypostyle l other principal apartments are by arches and domes supported by y simple piers finished in English ithout a single moulding of any kind. ing is harmonious with that in the e hall, and the terraces are provided ne lights executed in wrought and cast ing obscured glazing which gives a lly soft light. For artificial illumi- ectric lamps are furnished on bronze- gs with vert-antico Scagliola placques. tographs of the terraces are given as

awing reproduced in Fig. 7 represents ne large windows enclosing the terrace ne fountain court, and may be taken as f many similar windows elsewhere building. This excellent work was by Messrs. Peace & Norquoy, Ltd., hester, who had the contract for all the interior and exterior windows tel.
tive plaster work has been extensively with admirable effect in the main ts on the ground floor and elsewhere, n plastering has been largely used rts of the building for the twofold f providing a suitable surface finish ing additional protection against fire. orative modelling, carried out to the s designs by Messrs. H. H. Martyn & Co., Ltd., of Cheltenham, is in complete harmony with the general architectural motive, and deserves the highest commendation. Fig. 9 illustrates some of the modelling done by this firm. The execution of the plain and decorative plastering as well as the English stucco work in the hypostyle hall and terrace was entrusted to Messrs. B. H. Johnson & Sons, of London.

The whole of the mahogany fittings, doors, and screens were manufactured by Messrs. Waring & Gillow, Ltd., at their Liverpool works. The large doors in the ballroom are particularly fine examples. The painting and gilding generally throughout the building was executed by the same firm.

On the first, second, third, and fourth floors are arranged suites of sitting, bed, and toilet rooms, all self-contained and entered through a small hall; also suites comprising ante bed and toilet rooms; bed-sitting and toilet rooms for business men; and bedrooms without auxiliary accommodation, but all approached through either a vestibule or double doors to shut off sound from the corridors. All these rooms have furniture designed and fitted as part of the room, and comprising wash-stand, dressing-table, chest of drawers, and wardrobe.

The fifth floor behind the balustrade on the exterior of the building is devoted to staff bed, bath, and toilet rooms, and on the sixth floor are plain bedrooms without fireplaces, but all fitted with radiators and lavatories, the public bath and toilet rooms being arranged in groups at four points.

The decorations of the principal apartments, sitting-rooms, and bedrooms, as well as the furniture, carpets, hangings, electric light, bath and lavatory fittings, and details too numerous for individual mention are, with the exception of those in nine sitting-rooms, in accordance with the general scheme and designs of the architect, to whom fell the congenial task of realising the desire for a palatial building complying in every respect with practical

Fig. 8. French Restaurant: Details.

requirements, and completed down to the smallest detail in the most perfect harmony and taste.

Some of the specialist firms who have participated in this duty under the direction of the architect have already been mentioned. The nine sitting-rooms mentioned above were decorated by Messrs. Hampton & Sons, Ltd., and Messrs. Liberty & Co., Ltd., and Messrs. Waring & Gillow, Ltd., and as these were not in accordance with the general style of the building the architect preferred to abstain from dealing with them.

Three charming sitting-rooms, decorated and furnished by the former firm, are modelled on the styles of the Stuart and Queen Anne periods and on the style prevalent in England during the middle of the XVIIIth century. The attractive character of the room treated in the last-mentioned style is largely due to the manner in which the fireplace is divided off at one end of the room by panelled pillars and the china closets built into the walls on either side of the chimneypiece.

Three sitting-rooms decorated and furnished by Messrs. Liberty & Co. are equally worthy of attention, as also are various examples of bedroom furniture elsewhere in the hotel.

Three sitting-rooms have been decorated and furnished by Messrs. Waring & Gillow in various historic styles, all of which have been adapted to the requirements of a modern hotel.

The lavatory, bath, and toilet rooms are finished with tiled floors and walls executed by Messrs. W. B. Simpson & Sons, of London. The flooring is of grey tint with coloured borders, and is laid with foreign-made tiles similar in appearance to the familiar encaustic variety. The wall tiles are finished with Simpson's patent eggshell gloss surface, which is a pleasant change from the highly-glazed finish of ordinary tiling.

Telephones are provided in all bed and sitting rooms, as well as in the public-rooms, installed by the Post Office Telephone Department, and taking the place of electric bells throughout the building.

The equipment also includes installa of vacuum cleaners, gravity tubes, auton fire sprinklers, and hydrants.

As a last reference to the equipment of hotel we give particulars of the passe and other lifts supplied by the Otis Ele Company, Ltd., of London.

The two passenger lifts for visitors have the vertical travel of about 100 ft., run at speeds of 250 ft. and 300 ft. per mi respectively. The motors and operating m nery are overhead, and the lifting capaci about 1,500 lb., equivalent to the weigh nine or ten persons.

The guides and runners for the cars are m T-section, machined to ensure smooth and s working. Safety appliances of the v clamp type are provided, to operate in the e of excessive speed being attained from any c whatever.

These two lifts are operated from the ca self-centring lever handle switches, the trollers permitting the cars to be run at c fast or slow speed at the will of the attend and providing for an easy start and acce stop to be made without those sudden which are so much disliked by many of lifts.

The other lifts include one passenger for use by the staff and five service lifts various rises and rates of travel from 15 180 ft. per minute, and are operated on automatic push-button system. All the are equipped with indicators showing position of the cars, with electrical gat door contacts, and with all the custo accessories.

While desirous of expressing our appreci of the architectural design as a whole, an unsurpassed mastery by the architect o innumerable details constituting the app ments and equipment of this great hote feel that it would not be right to omit n nition of the credit due to Mr. William T the chief of the Midland Railway H Department, for the preliminary conceptio the project worked out and realised by Atkinson, as well as for the expert aid ren to the architect as the result of long pe experience in hotel management and s intendence.

While the new building and its equip furnishes an excellent illustration of mi hotel construction worthy in every way o architect, and of the artistic, scientific, practical experts who have worked unde direction, the results so far achieved give a foretaste of the ideal to be realised lat the final completion of the project. W informed that the plans for the front bloc now being detailed and that it is hoped this work will be completed within the twelve months. The demolition of the portion of the hotel has already commenced.

THE BUILDING TRADE.

BUILDERS AND STRIKES.

WITH rumours of a general strike in the building trade floating through the air the builder who has contracts in contemplation or in progress naturally asks of the precautions which may be necessary to avoid disaster.

It is proposed in the present article to examine some of the more important decisions of the Courts in order to see how far a strike clause can be made to protect the employer. Where the contract is silent, it will be taken that the mere fact of delay arising caused by a strike is no excuse for a breach of contract. For instance, it has been held that the charterer of a vessel, having undertaken to provide a full cargo of coals, is not excused by a strike of colliers making impossible to provide a cargo.

Where, however, a building has to be completed "within a reasonable time," it is received that the supervention of a strike might have the effect to extend the reasonable period.

For instance (in another shipping case), a bill of lading specified no time for discharge. During the unloading a strike occurred, which delayed the ship twenty-five days longer than otherwise would have been the case. In these circumstances it was held that the obligation on the consignees was to unload within a reasonable time, and the obligation was discharged if he unloaded in a reasonable time in the circumstances, assuming that those circumstances, as far as they caused delay, were not caused or contributed to by him.

A variety of interesting questions may arise as to the determination even in cases where, to all appearances, the rights and liabilities of parties are all set forth in black and white. Let us borrow and foremost:—"What is a strike?" Suppose an employer suddenly announces his intention to reduce wages by one-half, and, owing to the consequent stoppage of work, he is unable to fulfil his agreement, is he excused? It seems to have been clearly decided that a strike in its legal sense includes a stoppage which may have been more or less voluntary so far as the employer is concerned. Thus to borrow an illustrative form of the law laid down in another "coal case"), a colliery company agreed to supply 4,000 tons of coal to one P., at the daily rate of supply of 150 tons. In the event of a strike the company was not bound to keep up the daily supply. A strike occurred, owing to the refusal of company's workmen refusing to accept a reduction of wages proposed by the company, which strike lasted for four months, during which the company delivered no coal. At the end of the strike P. refused to take any more coal. It was held that the strike was merely a strike, although caused by a threat to lower wages; that the effect of the strike was merely to postpone deliveries; and that P. was bound to accept the coal remaining undelivered. It was also held that the delay was not such as to entitle P. to consider the contract as at an end in the commercial sense (King *v.* Parker (1876), 34 L. T. N. S. 5).

The question sometimes arises whether an ordinary stoppage by the men as if for a day amounts to a strike within the meaning of the clause. In the case of an arbitration between Allison & Co. and Rose Richards, which was heard by Mr. Justice Bigham on November 5, 1903, it appeared that on April 1, 1903, the plaintiffs entered into a charter party to carry a cargo of coal by their steamship to Leghorn. The charter party contained the clause providing as follows:—

"The cargo to be loaded in 130 running hours (excluding Sundays, Custom House, Derby, and local holidays, Easter Monday and Tuesday, Whit Monday and Tuesday). And further:—"Any time lost through strikes, lock-outs, or any dispute between masters and men occasioning a stoppage of pitmen, trimmers, or other hands connected with the working or delivery of the coal for which the steamer is stemmed; or by reason of accidents to mines or machinery, obstructions on the railway or in the docks; or by reason of floods, frosts, fogs, storms, or any causes beyond the control of the charterers, not to be computed as part of the loading time."

The colliers belonging to the colliery from which the coal was taken gave notice that they would work on Good Friday and the next day, but that they would take the Wednesday after Easter Monday, and on that day all work was stopped. It was contended on the part of the plaintiffs that demurrage was payable in respect of the Wednesday upon which the men refused to work, inasmuch as it was not a "holiday" within the meaning of that term, as used in the charter party. Further it could not be said to be a stoppage caused by a strike, as there was no dispute with the masters, who had done nothing either by way of approval or disapproval. It was argued on the other side that, although this Wednesday may not have been a "holiday" within the meaning of the charter party, yet the stoppage on that day was a stoppage *ejusdem generis*, with loss of time caused by strikes, lock-outs, etc. The late Mr. Justice Wright gave judgment for the defendants. He said:—"This was a holiday not within the control of the masters, and was, therefore, not within the exception contained in the charter party. . . . I am inclined to think, however, that a holiday taken by the men without the concurrence of the masters is sufficiently *ejusdem generis* with stoppage of work caused by a dispute between masters and men, and perhaps of strikes, and therefore within the exception."

Finally, it is useful for those who contemplate bringing pressure to bear upon a builder to know that he is generally well protected against strikes. For instance, building and engineering contracts usually contain some such clause as this:—

"The contractors are to complete the whole of the works (except papering and painting, or such other works as the architect may desire to delay) within . . . calendar months after the commencement of the same, unless the works be delayed by reason of any inclement weather, or causes not under the contractor's control or in case of combination of workmen, or strikes, or lock-out affecting any of the building trades, for which due allowance shall be made by the architect."

Sometimes the question whether a strike has caused delay is left to the decision of the architect. For instance, Clause 25 of the Form of Contract sanctioned by the Royal Institute allows the architect to extend time if works are delayed "by reason of any local combination of workmen, or strike, or lock-out affecting any of the building trades." If a dispute arises with the architect in regard to this matter the dispute may be referred to an arbitrator acting pursuant to Clause 32 of the same contract.

THE MEDIÆVAL PLUMBER.

THE mediæval plumber occupied a somewhat indefinite position as a craftsman. From the nature of his calling he was frequently required to work by the piece. The records of these jobs afford us little aid in attempting to appraise the value of his labour. It would be supposed that when working by time a comparison of the wages earned would enable us to easily estimate his position. But here again we find a difficulty in the fact that his wages varied widely. Sometimes a plumber would be paid 5d. a day, at another time he received 11d., his assistant, or "server," getting 4d. to 6d. a day.

The mediæval plumber often cast and recast the lead in "fyllettes." We read of the purchase of bellows for the fire in which the lead was melted, the "mold" and "panne" used, and "the svve to syfte their sande in." (Public Record Office Exch. Acc. 488-28-30.) The mould mentioned above was made by a carpenter, and was of sufficient value to be conveyed about from one scene of operations to another.

The plumber operated on cisterns, pipes, gutters, etc., and the purchase of lead, solder, nails, and wood for his fire, known as tallwood or byllettes, are common items in mediæval builders' accounts.

In the records of the Church of St. Mary-at-Hill, near London Bridge, printed by the Early English Text Society, will be found a plumber's bill for a large quantity of lead supplied in "quarters" to the churchwardens. In this volume, too, we have an account of money laid out for a shoulder and a breast of mutton for the plumbers and of "brekfastys" prepared for them.

In some accounts (Rec. Off. MS. 489-9) we read of the engagement of a plumber to work at Carnarvon and of his ride on horseback to Bangor to fetch his tools, the expenses of the journey being defrayed by his new employer.

In another set of accounts (MS. 488-27) we find the cost of carriage of the tools of the plumbers set down as paid by the employer.

In another series of accounts (489-7) is an interesting little story of the failure of two plumbers to keep an appointment. We may summarise the details as briefly as possible:

On June 20, 1532, Rauf Ratclief, who was employed as a labourer at Beaumaris Castle in North Wales, was sent by John Karvar, the "master of the workes," to the Abbey of Whalley in Lancashire to fetch two plumbers. Ratclief rode all the way on horseback, the cost of the hire of the animal, 3s. 4d., being defrayed by the master of the works, the messenger himself receiving also 3s. 4d. Ratclief delivered his message, but without success, for the record tells us that the two plumbers failed to "appere at Lammas" (August 1st). A second messenger was despatched. He, too, was a labourer, and his name was Thomas Haltmegge. He, too, rode a horse "lente" him by the master of the works, and, like Ratclief, he also received 3s. 4d. for himself, the same sum being paid again for the hire of the horse. Haltmegge was more successful, and the two plumbers arrived at Beaumaris Castle on August 21, where they worked for three days, one receiving 6d. a day and the other 5d. The failure of the plumbers to appear when wanted so much incensed John Karvar that on August 28 he "bounde the above-named plummers to appere there agayn at the Feast of Ester or within viii. dayes then nexte followyng then & there to work vpon the Kynges workes & not to departe withoute lycens, gyvyng them towards their costes homewardes xvid."

Why plumbers should be required to come all the way to North Wales from an abbey in the north of Lancashire, a distance there and back, as the record itself tells us, of 200 miles, is not clear. The above, however, is not the only instance of plumbers being fetched from this abbey. In some building accounts, numbered 488-27, we read of a man being sent to fetch two plumbers from Whalley Abbey to do work at Hardelagh, also about 100 miles from Whalley. In this case the cost of the plumbers' journey "cumyng and goyng" amounted to 6s., and the men worked for six weeks. The names of these two men were respectively Nicholas and Robert Whalley (the surname evidently a corruption of Nicholas and Thomas *of* Whalley). Of the two Nicholas held the higher place, but both men, if we may judge from the wages paid them, were singularly expert craftsmen. Nicholas received the unusual wage of 11d. a day and Robert 10d.

REPERTORY THEATRE, LIVERPOOL.

This building, recently opened, is a reconstruction by Professor Adshead, of the old Star Theatre. At the back of the new stage is a plastered wall, lighted with electric points, on to which coloured lights can be thrown from a baton floating in the flies, so as to give a novel effect of mysterious distance. The decoration is Renaissance in character, mainly of white and gold: the foyer, beneath the pit, represents an old Italian garden-terrace. There are two box tiers, and two of the boxes have balconies.

LABOUR IN THE BUILDING TRADE.

EIGHTEEN separate trade unions, representative of every section of workers engaged in the building and woodworking industries, took part in a meeting on the 5th inst. in Trafalgar-square to agitate for improved conditions of labour, shorter hours, and increased pay. The meeting was organised by the Woodwork Joint Trade Movement Committee, and about 7,000 people were in the square.

Mr. S. Stennett, General Organising Secretary of the Amalgamated Society of Carpenters and Joiners, said that the Committee were prepared to recommend an increase of a half-penny an hour, beginning in the first week in September.

Other speakers stated that several sections of workers had given in their notices to the employers, and the first batch of notices would expire on June 10.

A labour correspondent writes to the *Manchester Guardian*:—"All the trade unions engaged in the building trade are taking joint action on national lines to secure an increase of wages. District Conferences between employers and workpeople have been arranged at all the important centres to discuss the demands, but in almost every case the employers seem disposed to restrict them. In common with the shipbuilders, the employers in the building trade contend that the coming into force of both the unemployment and sickness sections of the Insurance Act will place on their trade burdens as great as it can bear at the present time, and this is assigned as a reason for refusing the men's request. No settlement will be satisfactory to the men unless it is a national one.

All the negotiations are timed to end during the month of May, so that if a strike should be necessary it will begin in the first week of June."

According to the *Western Mail*, no arrangement has yet been made as to the date upon which the Conciliation Board will meet to adjust the questions outstanding between the master builders of Cardiff and their workmen. The plumbers have agreed to the provisional arrangement whereby their Association will come within the scope of the Conciliation Board for the purposes of the present negotiations, but no reply on this phase of the position has been received from the painters, and the meeting of the Conciliation Board cannot be fixed until this reply has been received.

The labourers' section have signed their agreement with the Master Builders' Association. Besides providing an increase of a half-penny all round, with a minimum for general labourers of 6d. per hour and 6½d. for scaffolders and men on special work, the agreement deals with overtime, granting overtime at the rate of time and a quarter for the first two hours, time and a half for the third, fourth, and fifth hours, and double time for longer periods. A code of working rules has also been set up between the parties.

Builders' labourers at Swansea threaten a strike on the question of a demand for an increase of a halfpenny per hour. The men say that their demand has been flatly refused, and the question is being placed before the General Council of the Gasworkers' and General Labourers' Union, and permission is asked to strike. About 250 men are concerned.

Altogether 118 Dunfermline joiners came out on strike on the 1st inst. It was reported that about one dozen were working.

Motherwell joiners are continuing their agitation for an increase of wages. A request was made for an additional ½d. per hour, to take effect on May 3, and another ½d. six months later.

Stirling master joiners have agreed to advance the wages of their workmen from 8d. to 8½d. per hour.

Girvan plumbers have struck work. They demand a penny per hour increase in their wages.

It is stated that the offer of the London Master Builders' Association to the disaffected workmen to increase their wages a halfpenny an hour on condition that they withdrew their demands for a increase of 1½d., a reduction of summer working hours from fifty to forty-seven, and double pay for overtime, has been declined by the men. The notices which have been handed in, due to expire during the first and second weeks of June, are therefore still in operation.

TOWN HALL, OLDHAM.

Plans have been passed for an extension of the Town Hall, to cost about 26,000*l*. The result of the scheme will be to bring the various departments of the Corporation, now carried on in different buildings, under one roof. The architects are Messrs. Taylor & Simister, of Oldham.

GENERAL BUILDING NEWS.

ALL SAINTS' CHURCH, EAST FINCHLEY.

The Bishop of London consecrated on Monday evening (6th inst.) the chancel section of All Saints' Church, East Finchley. This section, which consists of chancel, Lady Chapel, north transept, vestries, and heating chamber, completes the church of which the nave portion was built in 1891. The church is XVth century, perpendicular in style, and externally is built of red bricks, Bath stone being used for all doorways, windows, strings, buttress heads, copings, bell gable, etc. The roofs are covered with red tiles. Internally the nave arcade and columns are of Bath stone and the walls red bricks. The chancel—the east end of which is apsidal and filled in with five two-light windows—is richly treated with stonework, the scheme of windows being carried along the north transept and Lady Chapel arcades as stone panelling, the panels being filled between the stone mullions with brickwork covered with plaster. A carved oak screen divides the nave from the chancel. The main dimensions of the church are:—Length of chancel, 52 ft. by 25 ft. wide and 52 ft. high to the roof ridge; length of nave, 80 ft. by 25 ft. wide and 54 ft. high. The height to top of cross on bell gable is 66 ft. Messrs. Cutts, of Southampton-street, Strand, W.C., are the architects, and the chancel section of the work has been carried out by Mr. A. Porter, of High-road, Tottenham, N.

TRAINING COLLEGE, BARRY.

This college for women students is to be erected on a site at the Buttrills, overlooking Barry Dock and the Bristol Channel, from the designs of Messrs. Teather & Wilson, FF.R.I.B.A., architects, of Cardiff. The college will consist of three blocks, the centre building being the education block, and the blocks on either side being the hostels, each hostel providing accommodation for sixty-five students. The contract has been secured by Messrs. W. Thomas & Co., builders, of Cardiff.

CARNEGIE LIBRARY, MIDDLESBROUGH.

This new public library has been erected at a cost of about 18,000*l*. from the designs of Mr. Edwin Cooper, F.R.I.B.A. The lending department will accommodate 40,000 books, and on the first floor are the reference, law, and patents libraries. The building is of fire-resisting construction, and the contract was carried out by Mr. Henry McNaughton, builder, of Middlesbrough.

SCHOOL ENLARGEMENT, BATTERSEA.

We understand that Mr. A. H. Ryan Tenison, F.R.I.B.A., has been commissioned by the Governors of Sir Walter St. John's Schools, Battersea, to prepare a scheme which has been approved by them and is now before the Board of Education and Local Education Authority for enlargement of the said school.

TRADE NEWS.

Messrs. Mason, Maclaren, & Co., 26 and 27, Bush-lane, and 3, Suffolk-lane, Cannon-street, London, E.C., have recently been appointed buying agents for a Vancouver firm, who will be purchasing large quantities of all kinds of building materials, both external and internal, including electrical fittings, etc.

Messrs. E. A. Roome & Co., of 36, Basing-hall-stret, E.C., are carrying out an extension to the Convent of St. Mary of Nazareth, Edgware, under the supervision of Messrs. James Brooks, Son, & Adkins.

Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's-road, London, W.C., have secured a large contract for building new offices at Nos. 48-52, Fleet-street, E.C., for the Norwich Union Fire and Life Insurance Society, Ltd. (See p. 543.)

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Bethnal Green, South-West.—Erection of buildings on the western side of Coventry-street, Bethnal Green (Mr. P. K. Allen).—Consent.

Hampstead.—Erection of three buildings on the north-eastern side of Eldon-road, Hampstead (Mr. S. C. Lathbridge for Mr. J. Russell).—Consent.

Lewisham.—Retention of a wooden coal office in the railway yard on the southern side of St. Mildred's-road, Lewisham (Messrs. Martin Brothers).—Consent.

Lewisham.—Retention of porches and bay windows to five houses on the western side of Verdant-lane, Catford (Mr. J. Hughes).—Consent.

Marylebone, East.—Showcase in front of No. 34, Finchley road, St. Marylebone (Dorland Agency, Ltd.).—Consent.

Paddington, South.—Additional story over projecting one-story portion at No. 97, Inverness terrace, Paddington (Mr. H. Redfern for Mrs. C. Bubb).—Refused.

Strand.—Projecting sign at No. 3, Piccadilly-circus (Mr. H. M. Wakley for Mr. Norris).—Refused.

Walworth.—Iron and glass shelter at the entrance to a cinematograph theatre upon the site of Nos. 42 and 44, Old Kent road, Walworth (Messrs. Z. King & Son).—Refused.

Wandsworth.†—Addition at No. 175, Longley road, Tooting (Mr. J. E. Jefferson).—Refused.

Wandsworth.†—Retention of a wood and glass building in front of the coachhouse at No. 40, Streatham-hill, Wandsworth (Mr. H. G. Finch).—Consent.

Whitechapel.—Addition to the Alexandra wing of the London Hospital on the north-eastern side of Turner-street, Whitechapel (Mr. J. Oatley for the Governors of the London Hospital).—Consent.

Lines of Frontage and Construction.

Clapham.—Showcase in front of No. 116, Clapham Park-road, Wandsworth (Messrs. H. Bignold & Idle).—Refused.

Finsbury, Central.—Temporary wooden rack for the storage of ladders on the forecourt of No. 7, Pentonville-road, Clerkenwell (Messrs. J. H. Heathman & Co.).—Consent.

Hammersmith.—Retention of a steel and concrete gangway over the public way of Wood-lane, Hammersmith, at the Wood-lane Exhibition (Mr. F. White for Mr. Imre Kiralfy).—Consent.

Line of Frontage and Building for the Supply of Electricity.

Wandsworth.—Additions to an electricity transformer-station on the southern side of Tooting Bec-gardens, Streatham (Mr. W. Stanley Peach).—Consent.

The recommendations marked † are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BAINSFORD (Falkirk).—Re-erection of hall and offices, Smith-street (1,000*l*.); Trustees, United Free Church, Bainsford.

Barry.—Training college (38,000*l*.); Mr. William Thomas, builder, Canton.

Blairlogie.—Proposed housing accommodation for 120 miners; Secretary, Manor Powis Coal Company.

Bristol. — Extensions to Colston School (2,450*l*.); the Governors.

Burnley.—Foundry for Messrs. G. H. Pemberton & Co., loom-makers.

Chasetown.—Completion of mining institute (5,330*l*.); Messrs. Mason & Son, builders, Hednesford.

Colbren.—Proposed 100 houses; Mr. Evans Bevan, Neath.

Dundee.—Reconstruction of Morgan Academy (10,500*l*.); Dundee School Board Committee.

Dunfermline.—School clinics for Carnegie Dunfermline Trust (20,000*l*.); Messrs. James Stewart & Sons (mason work), Dunfermline.

Eastbourne.—The following plans have been passed:—Alterations, New Hotel, for Mr. C. S. James; Messrs. M. Martin & Sons, builders. Additions to laundry, Station-road, for the Willingdon Laundry Company, Ltd.; Mr. H. B. Ransome, architect. Addition, Longstone Hall, for the Building Committee of the Assembly of Brethren; Mr. A. W. Vennes, architect. Four houses, Mountney and Charleston roads, for Mr. A. Avard; Mr. W. F. Box, architect. Alterations, Lamb Hotel, for Messrs. Harvey & Son; Mr. Andrew Forc, architect. Addition, "Angles," Royal-parade, for Mr. J. H. Taylor; Messrs. Miles & Selmes, builders. Additions, "Astonville," Motcombe-road, for Mr. P. H. Mold: Messrs. Gibbons Brothers, builders. Additions to "Bolsover," Bolsover-road, and "Glenrise," Carew-road, for Mr. B. Earp. Additions to premises, Bath-road, for Mr. C. Godfrey; Mr. P. D. Stonham, architect; Mr. F. S. Shelley, builder.

Eccles.—A plan has been lodged for a picture house, Eldon-place, Patricroft, by Mrs. Bennie.

Edinburgh.—Additions to works, Scienne road, for Messrs. Bertrams, Ltd.; clubhouse, Wardie-avenue, for the Edinburgh Women Students' Athletic Club.

Elland.—School and completion of church (5,000*l*.); Vicar, All Saints', Elland.

Elvet Moor.—Power sub-station; Secretar

* See also our list of Competitions, Contracts, etc., on another page.

ity of Durham Electrical Power Distribu- Company, Ltd.
ex.—School, Woodford (400 places), and gement of school, Richmond-avenue, Shoe- ess (300 extra places); Mr. J. H. blas, Secretary, Education Committee, ty Council Offices, Chelmsford.
ghington.—Parish hall; Mr. G. Walesby , architect, Darlington; Messrs. Scott, rs, Aycliffe.
lbeach.—Alterations to premises, High- , for the Lincoln and Lindsey Banking any.
ve.—Plans have been passed for two s and one house and shop, Bolsover-road, Mr. J. J. Cooper, and four houses, nce-gardens, for Mr. P. B. Hunter, on of Mr. A. Lewer. LONDON COUNCILS.

Battersea.—The carriageway of a portion of Battersea-rise is to be repaired with granite macadam at an estimated cost of 118*l.* Repairs are also to be carried out to the carriageways of Strath-terrace and Boutflower-road with tarred slag macadam at estimated costs of 118*l.* and 257*l.* respectively. The surfaces of the carriageways of forty-two roads are to be tarred at an estimated cost of 802*l.* Electricity mains are to be extended in four roads at an estimated cost of 167*l.* A plan has been lodged with the London County Council by the Morgan Crucible Company, for the erection of a factory in Fords-place.

Bermondsey.—The following plans have been passed:—Messrs. Barlow & Roberts, 15, Red cross street, Southwark, S.E., factory, site of No. 224, Tower Bridge road; Messrs. G. Potton & Son, Nos. 2 and 4, Riley-street, Bermondsey, S.E., on behalf of the proprietors of Butler's Wharf, Ltd., Shad Thames, warehouse on site of Nos. 1, 2, and 3, Curlew-street; Mr. W. G. R. Sprague, architect, Criterion-chambers, Jermyn-street, W., cinematograph hall, Irwell-place, Rotherhithe.

Bushey.—The County Surveyor of Hertfordshire has been instructed to carry out kerbing works and improving the footpath of Falconer-road, at an estimated cost of 130*l.*

Camberwell.—New floors are to be constructed by direct labour to cover the Council's first-class swimming-baths at Church street and Dulwich, for the winter season. The tender of Messrs. Manders & Co., at 1,454*l.* 5s. 10d., has been accepted for kerbing, channelling, providing foundations for asphalt paving, road work, etc., in part of Red Post-hill.

Croydon.—The County Council has accepted the tender of Messrs. J. Smith & Sons, Norwood, S.E., at 1,710*l.*, for the erection of a boiler-house and chimney-shaft at the Borough Hospital at Waddon. Plans have been passed for Messrs. Paish, Tyler, & Co., Ltd., 5, Station-road, for four houses, Sefton-road; also for the Stroud Green House, Ltd., 30a, George-street, for three houses in Blackhorse-lane, and six houses in Sissinghurst-road.

Deptford.—A portion of the carriageway of Grove-street is to be paved with redressed granite setts and wood-blocks, at an estimated cost of 1,717*l.* Six other roads are to be paved with asphalt at an estimated cost of 2,554*l.* A plan has been passed for Messrs. Oldman & Sons for the erection of thirty-eight houses in Troutbeck-road, and twelve houses in New Cross-road.

Hackney.—Two-thirds of the estimated costs of the work having been obtained, the paving of a portion of Hertford-road as a new street, and the passage leading from Reading-lane to Florfield-road, are to be carried out at estimated costs of 229*l.* and 124*l.*, respectively. Plans have been lodged with the London County Council by Mr. C. G. F. Rees for the erection of a block of buildings on the western side of Clifton-grove, Graham-road. The following plans have been passed:—Messrs. J. & J. Dean, buildings, Theydon-road; Mr. J. Tennant, factory, Hertford-road; Messrs. Sheffield Brothers, additions to factory, Bruns wick-place, Farleigh-road; Messrs. O. & L. Chillingworth, twenty-two houses off Upper Clapton-road.

Islington.—Repairs are to be carried out to the carriageways of five roads, at an estimated cost of 775*l.* Dowrey-street is to be made-up and paved as a new street. Repairs are to be carried out to the carriageways of Highbury-crescent and Russell-road, at an estimated cost of 206*l.* The wood-paving in Highbury-grove, Hornsey-road, and Holloway-road, is to be renewed and repaired at an estimated cost of 1,600*l.* The carriageway of Fonthill-road is to be repaired at an estimated cost of 156*l.* The sewer in Mildmay-grove is to be reconstructed with 9-in. stoneware pipes encased in Portland cement concrete, at an estimated cost of 365*l.* The brick sewer in Seven Sisters-road is to be repaired at an estimated cost of 350*l.*

Kensington.—The carriageway of Ansdell-street is to be repaved with Kensington clinker blocks at an estimated cost of 90*l.* Tenders are to be invited for renewing the wood-paving in six roads and laying new wood-paving in two other roads. Plans submitted by Messrs. Joseph & Smithem, architects, 83, Queen-street, Cheapside, E.C., for the erection of a building at the rear of 45, Edwardes-square, have been approved.

Lewisham.—Tar-paving works are to be carried out in various streets in the Borough at an estimated cost of 172*l.* Plans have been lodged with the London County Council by Mr. C. T. Standen for six houses, in Brockley-rise. Plans have been passed for Mr. A. H. Attwater for the erection of a picture palace in Brockley-road.

Marylebone.—The tender of the French Asphalte Paving Company has been accepted by the Borough Council for carrying out asphalt works in Church-street and North-street at 13s. per super. yard; as has also the tender of the Val de Travers Company for carrying out similar work in Bird-street, at 10s. 6d. per super yard.

Rickmansworth. — London-road is to be diverted at Batchworth-hill at an estimated cost of 500*l.*

Southgate.—The Surveyor has been directed to prepare plans and estimates of the probable cost of making-up Cannon-road. The following plans have been passed:—Mr. A. Arnott, four houses, Conway road; Messrs. Edmondsons, Ltd., three houses, Queen's-avenue, Winchmore Hill; Mr. W. J. Keene, jun., twenty-four houses, Hazelwood-lane, Palmer's Green.

Wandsworth.—A portion of the footpath on the north-eastern side of Chestnut-grove, Balham, is to be kerbed with new 12-in. kerb and repaved with artificial stone, at an estimated cost of 100*l.* A portion of the footpath of Valley-road, Streatham, is to be similarly paved, and a portion of the existing kerb relaid with a new kerb fixed where necessary, at an estimated cost of 142*l.* A plan and specification submitted by the Borough Engineer has been approved, and tenders are to be invited for paving part of the carriageway of Long-road, Clapham-common, outside the tramway tracks and margins, with granite setts, relaying the kerb on the southern side of the road, and restopping the existing tar-paved footpath. Tenders are further to be invited for wood-paving and other works in Mitcham-lane and Southcroft-road, Streatham, Wimbledon-road, Balham, and Clapham Park-road, Clapham South, also for repair works in a part of Prince's-road, Southfield. The following plans have been passed:—Mr. C. Banks, four houses, Sutherland-grove, Southfield; Mr. T. C. Ranger, additions, Gordon Dene, Prince's-road, Southfield, and two houses and motor garage adjoining; Messrs. Swain & Selley, forty-five houses, Brudenell-road, Balham; Mr. F. T. Dear, buildings, Hill Side, Atkins-road, Clapham South; Messrs. L. & W. Whitehead, two shops, High-street, Clapham; Messrs Chapple & Utting, four houses, Ockley-road, Streatham.

Westminster.—Various works are to be carried out in Grosvenor-road at an estimated cost of 140*l.* The tender of Messrs. Love & Co., Exeter-street, Strand, W.C., has been accepted, at 84*l.* 6s. 8d. and 412*l.*, for carrying out repairing and painting works at the public urinals and underground conveniences in the Borough. The City Council has granted the application of Mr. Claude W. Ferrier, architect, 11, Waterloo-place, S.W., for consent to the construction of vaults at 12, Waterloo-place and 30, Charles-street, subject to a clear space between the surface of the carriageway and the top of the vaults of 27 in., and the vaults being specially strengthened to carry vehicular traffic. Plans have been lodged with the London County Council by Messrs. Metcalf & Grieg to erect a building on the site of Nos. 1 and 2, Clare-market.

Wimbledon.—The Borough Surveyor has been instructed to submit estimates of the cost of making-up the back passages of each block of houses on the Ashen-grove Estate. A proposal is on foot to set back the kerb-line and make-up the carriageway of a portion of Durnsford-road; also for the laying of new sewers in Park-side and Queensmere-road, at an estimated cost of 273*l.* Plans have been passed for Mr. H. W. Rickard for the erection of four houses in Dora-road; also for Messrs. Ryan & Penfold, for houses in Durnsford, Arthur, Ryfold, and Strathmore roads.

METROPOLITAN ASYLUMS BOARD.

AT the fortnightly sitting of this Board on Saturday the following matters were dealt with:—

Leuvesden Asylum.—A letter was received from the Local Government Board stating, with reference to the proposal to provide bridges at this asylum, at an estimated cost of 7,000*l.*, that, having regard to the increasing number of infirm cases at the asylum, they will raise no further objection to the provision of some additional means of escape in case of fire, but that they are not satisfied that it is necessary to incur the expenditure proposed for this purpose; and suggesting that tenders should be invited from selected engineering firms on a brief description of the requirements only, leaving the tenderers a free hand as to detail, so that stock materials could be used, as the Board are advised that this course would prove more economical than inviting tenders upon a specification of an inelastic character and with due care should prove equally satisfactory.

Quantity Surveyors.—Messrs. W. T. Farthing & Son were appointed to take out the quantities in connexion with proposed work at Darenth Asylum, at a commission of 2½ per cent. on the amount of the accepted tender.

Accepted Tenders for Works.—The following tenders for works were accepted:—Erection of wall at casual ward, Mr. W. Hussey, 229*l.*; cleaning and painting work at East Cliff House, Margate, Mr. H. H. Inns, 36, Camomile-street, E.C., 297*l.*; repairs to roads, etc., at Northern Hospital, Mr. E. Greenfield, Bush Hill Park, Enfield, 186*l.* 10s.; repairs to roads, etc., at South-Western Hospital, Messrs. Chittenden & Simmons, Maidstone, 201*l.* 3s. 6d.; installation of lifts at Tooting Bec Asylum, Titan Lift Company, 18, Red Lion-street, W.C., 420*l.*; cleaning and painting works at Tooting Bec Asylum, Mr. H. H. Inns, 1,025*l.*; heating apparatus at the Downs School, Mr. L. Hill, Edgehill, Liverpool, 674*l.* 15s.

LEGAL COLUMN.

Workmen's Compensation.

The case Rex *v.* Templer, noted by us January 5 last, when before the Divisional Court, has been carried to the Court of Appeal. The case is chiefly of importance as illustrating the litigation that is caused by drawing Acts of Parliament in loose terms with ambiguous language. The case arose under the Workmen's Compensation Act, 1897, but is of application under the Act of 1906. A workman was injured in March, 1907, and had received compensation from his employers, a memorandum of which was registered. There was a representative Committee in existence which had dealt with the case in various stages, and in September, 1910, had made an award of 1d. a week to keep the claim alive. In February, 1911, the workman applied to the County Court for a review of this last award, and the question for the Court was whether the Committee or the County Court Judge as arbitrator was the proper tribunal to deal with the case. The County Court Judge held that he had not jurisdiction; the workman then appealed to the Court of Appeal. The Court of Appeal held that the appeal ought to have been taken to the Divisional Court. The Divisional Court held that a review was a fresh matter, and that the County Court had jurisdiction; on a further appeal the Court of Appeal found that the question was difficult to determine owing to the ambiguous wording of the Act, but on the whole agreed with the Divisional Court. The case will therefore go before the County Court Judge, and thus there will have been five trials over a matter which the Court of Appeal characterised as wholly unimportant which way it was decided. The facts are set out in full in our former note.

LAW REPORTS.

(COURT OF APPEAL.)

(Before Lords Justices VAUGHAN WILLIAMS, FLETCHER MOULTON, and FARWELL.)

Validity of Architect's Certificate: Ashwell & Nesbitt, Ltd. *v.* Allen & Co.

THIS case came on for hearing on the 1st inst. upon the defendants' appeal from a judgment of Mr. Justice Coleridge.

The plaintiffs, Messrs. Ashwell & Nesbitt, Ltd., of Leicester, brought the action against Messrs. Allen & Co., of Westminster, to recover 377*l.* for work done and material supplied to a building in Regent-street, London, under a contract dated May 12, 1909, under a certificate of Mr. F. T. Verity, the architect for the building owners, Messrs. Lewis & Allenby. The defendants were the general contractors for the work, which was that of re-erecting premises belonging to the Crown in Regent-street, and the plaintiffs were sub-contractors for the heating and hot-water installation to the amount of 3,320*l.* Various payments were made to the plaintiff on account up to March, 1911, falling short of the sum due by 377*l.*, of which sum the defendants denied liability. Defendants alleged that the work was done under contract, that it was a term of the contract that payment should only be made to the plaintiffs on the inclusion of the amount in the architect's certificate, and on payment to the defendants by the building owners of the amount.

It appeared that the defendants had settled a claim for extras with the building owners for 5,000*l.*, part of which was paid in cash and part in prior lien bonds, issued by the building owners on the property. Plaintiff contended that the terms of the settlement were equivalent as between themselves, and the defendants, to payment to the defendants, and that the defendants were estopped from denying that they had received payment, and that because the defendants chose to enter into an arrangement with the building owners, they had no right to hold over the balance of the plaintiffs' account. The formal certificate for 377*l.* was issued on March 1, 1910, by Mr. Verity, which the plaintiffs forwarded with a request for the cheque, and this certificate, Mr. Verity alleged, was included in a certificate he issued in November, 1910, to the defendants, for 1,595*l.* This, however, the defendants denied, and their case was that at the time in question disputes were going on as to the number of radiators put into the building, and that they had given the building owners large credits for a large difference in the numbers supplied, and that they could go behind the certificate upon that ground, and also upon the ground that the architect, without any notice to the defendants, had issued the certificate for 377*l.* Mr. Justice Coleridge, after hearing the evidence, held that in the circumstances the plaintiffs were entitled to recover, and gave judgment for them for the amount claimed, with costs. Hence the present appeal of the defendants.

Mr. Hudson, for the appellants, said that the point for the Court was the validity of the architect's certificate. He contended that the architect had completely abrogated his functions as a certifier. He submitted that the architect, in the circumstances, had no power to give the certificate, and the account, having been settled, it was invalid.

Mr. Matthews, on behalf of the respondents, said it was admitted there was no collusion or conspiracy; therefore it was a valid certificate upon which his clients were entitled to be paid. If he failed in regard to the validity of the certificate, then he would submit that, though the contract between Messrs. Allen & Co. and the building owners was not incorporated in the sub-contract, as the architect had authority to give orders for various alterations under the larger contract, that authority extended to the sub-contract.

In the result their Lordships said that, in their opinion, the validity of the certificate was doubtful, and that probably it was a case for a new trial. In the circumstances, however, the appeal would be allowed, the 377*l.* paid into Court to be paid out to the appellants, who would receive the costs of the appeal and the costs which they had paid. The case could be tried on *quantum meruit*.

KING'S BENCH DIVISION. DIVISIONAL COURT.

(Before the LORD CHIEF JUSTICE, Justices PICKFORD and AVORY.)

The King *v.* The Tribunal of Appeal (*ex parte* the London County Council).

THE Court heard arguments dealing with the Euston-road building line dispute, and in connexion with the rule *nisi* for mandamus obtained by the London County Council, and calling upon the Tribunal of Appeal to show cause why they should not state one special case for the purpose of appeal, instead of three special cases.

Mr. F. F. Daldy appeared for the London County Council; Mr. A. H. Bethune for the Metropolitan District Railway; Mr. A. F. Wootton for the owners of the Adam and Eve public-house; and Mr. Herbert Smith for the trustees of the late Mr. Leslie.

Mr. Bethune said a rule had been obtained ordering the Tribunal of Appeal to show cause why they should not state one special case in the matter of certain appeals against the Tribunal's decision as to the London County Council's Superintending Architect's certificate *re* a building line in the Euston-roa
The ground of the rule was that the Tribuna
having given a decision in the matter
several appeals, decided to state three speci
cases, one for each appellant. Mr. Dal
objected, on behalf of the County Council,
the stating of three separate cases. T
Metropolitan Railway Company wanted
special case dealing with their own particul
matter, because they said their point w
entirely different from the others. T
Tribunal of Appeal had expressed its willin
ness to state separate cases with the points
law if the Court so ordered.

Replying to the Lord Chief Justice, Coun
said the Superintending Architect, at t
instance of the County Council, laid down
general building line in the Euston-road. T
line originated with two houses belonging
Mr. Leslie's trustees, and ran from Osnebur
street to Hampstead road, and included t
Metropolitan Railway Company's property,
wall as the Adam and Eve public-house.

The Lord Chief Justice: The County Coun
want the one special case stated for all t
appeals?

Counsel: Yes.

His Lordship: On what ground?

Counsel: They say it would be more co
venient to have the one case and one set
Counsel. We object, because we say our po
is different from the others.

His Lordship: What point are you raisin

Counsel: The Tribunal has held that th
is no general building line at all, because
the houses within a certain distance mark
on the map have been pulled down. That
a decision in favour of the Metropolitan R
way Company, and that is the only point t
could be raised for argument on their o
With regard to the other appellants,
Tribunal has decided against Mr. Lesl
trustees, holding that the building line appl
to them all right, while, on the other hand,
Tribunal has decided in favour of the Ad
and Eve public-house, holding that it
built on old foundations, and is not goverr
by a building line.

The Lord Chief Justice (to Mr. Dald
Why do the County Council object to the th
cases?

Mr. Daldy: The Act of Parliament s
one case is sufficient, and that will be
expensive.

The Lord Chief Justice: The Council w
to take the building line through y
property, Mr. Bethune?

Mr. Bethune: Yes.

His Lordship (to Mr. Daldy): Under w
section of the London Building Act do
argue that only one case is necessary?

Mr. Daldy: Sect. 22.

Continuing, Mr. Daldy said there was
one proceeding before the Tribunal, and
was as to the general line. It was no
matter between parties. If there had bee
number of proceedings between differ
parties and about different sections of a r
things would have been different.

Replying to the Lord Chief Justice,
Daldy said at the present moment the
real appellants were the County Council
Mr. Leslie's trustees, while the London Cou
Council would also be respondents if th
were ultimately other appellants. The sec
of the Act dealing with the matter said
one case should be stated, and that could
be construed to mean that three or more c
could be stated.

Mr. Justice Pickford: If you have only
case, which of the three other parties wo
come to oppose you?

Mr. Daldy: They could all come and ar
against me if necessary.

The Lord Chief Justice said, in his opin
the rule should be discharged, for Mr. D
had not shown the Court any section w
could make them order the Tribunal to s
only one case with three separate matters
appeals. There was, he thought, no powe
this Court to fetter the jurisdiction of
Tribunal as to how many cases it should st

Mr. Justice Pickford agreed. He said
facts showed that there were objections to
building line. There were several of t
objections, but the Court was only asked
deal with three of those, one by the M
politan Railway Company, one by Mr. Le
trustees, and the other by the owners of
Adam and Eve public-house. The first
appealed to the Tribunal, but the owne
the Adam and Eve were only heard as i
ested parties. The Tribunal decided in fa
of the Metropolitan Railway Company,
against Mr. Leslie's trustees, and they
then asked to state a case with regard to
western and eastern ends of the line by
London County Council, and with regard
piece of the middle of the line by Mr. Le
trustees. The Tribunal was willing to
cases with regard to the three different

LAW REPORTS.—*Continued on page*

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competition, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xiv.; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

MAY 15.—**Portland.**—COUNCIL OFFICES.—The rtland U.D.C invite competitive designs and ans for Council Offices. See advertisement in ue of March 8 for further particulars.

LAW REPORTS.—*Continued from page 558.*

f the line, and state their reasons for acting s they did in each case; but the County ouncil said that only one case was necessary, nd tried to prohibit the Tribunal from stating ore than one. He did not think it was ecessary to decide whether the cases were eparate or not, for there was no doubt that ie cases were different and distinct, and one ad only to look at the plan of the building ne to see that the statement of the Tribunal s to the necessity for three special cases was ie correct one. Even if only one case were ated, all three of the parties interested would ave to appear before the Court and be heard, nd, therefore, there would be three lots of ntentions and facts. So he thought, when e Tribunal decided to state three cases, they ecided quite properly, for by that means the ppeals would be dealt with more satisfactorily.

Mr. Justice Avory concurred, and the rule as discharged with costs against the London ounty Council.

OBITUARY.

Sir John Taylor.

As we announced last week, the death curred, on April 30, at his residence, Moorld, Surbiton Hill, Surrey, of Sir John aylor, K.C.B., lately of H.M.'s Office of orks, in his seventy-ninth year. Sir John aylor was the son of William Taylor, of arkworth, Co. Northumberland; in 1860 he arried Emma Hamilton, daughter of the late enry Hadland. In 1859 he entered the Office Works; in 1881 he was elected a Fellow of e Royal Institute of British Architects; he rved as member of the Council, and was a ce-President, 1905; in 1902 he joined the chitectural Association. Sir John Taylor as appointed, in 1866, Surveyor of Royal laces, Public Buildings, etc., in H.M.'s Office Works; he held that post until 1898, when was appointed Consulting Surveyor, having en created a K.C.B. in the previous year.

Sir John Taylor's more important architural work, the *Builder* has illustrated the ar Office, Whitehall (January 6, 1906, four-ge perspective drawing, and December 14, 7, the loggia), as carried out by him in njunction with Mr. Francis Clyde Young, er the plans and designs of Mr. Clyde ung's father, the late William Young, ich were illustrated in our issue of March 25, 1899—Messrs. Foster & Dicksee were the contractors, for 447,000*l.*; and Bow-street Police-court and Station (June 21, 1879), built by Messrs. George Smith & Co., at a cost of about 40,000*l.*, and completed in 1881. He was the architect of the Bankruptcy Courts and Offices, Carey-street, W.C., 1890-2, which cost nearly 70,000*l.*; of the adjacent Government Laboratories for the Inland Revenue and Crown Contracts Departments, in the Clare-market area, 1896 7; alterations and extensions of the National Gallery, Trafalgar-square, 1884-7, with the new central rooms, Nos. I.-VI. (as numbered in 1890), the north, east, and west vestibules, and the main staircase, of two flights, which replaced the double staircase by Sir James Pennethorne, the decorations being by Messrs. Crace & Son; additions to Marlborough House; the new buildings for the Record Office, for which were pulled down the Master of the Rolls' House (by Colin Campbell), the Rolls Chapel, and Rolls-yard, to the west of Pennethorne's block, whereof he followed in the main the design—built in 1892-5 by Messrs. Foster & Dicksee, with Parliamentary votes of 65,000*l.* in all; the rebuilding, with large additions, of H.M.'s Patent Office on the Southampton-buildings. Staple Inn, Took's and Quality courts, and Furnival-street sites, with the new library, court-room, and sales-branch, begun in 1891, by Messrs. Perry & Co., and still in progress, for which, in respect of the Staple Inn façade (1894-5), he followed the Jacobean elevation of the terrace block designed by Messrs. Wigg & Pownall, for the adjoining offices (1842-3) of the Taxing Masters in Chancery, incorporated by him in the new range of buildings on the north side; and the South-Western, North London, and St. Marylebone Police-courts. Sir John Taylor was a member of the Constitutional Club, and of the Royal Wimbledon and Home Park Golf Clubs. The funeral took place at Brookwood Cemetery on Saturday last, after a service in St. Mark's, Surbiton.

Mr. James Barbour.

The death of Mr. James Barbour, architect and civil engineer, Dumfries, has just occurred at Harrogate, where he had been staying for the past fortnight. Mr. Barbour was a Fellow of the Scottish Society of Antiquaries, and superintended for that Society excavations at two Roman stations in Dumfriesshire, namely, Birrens and Burnswark. He also carried on similar work, but on a smaller scale, at various places on behalf of the local Antiquarian Society. Mr. Barbour was a Justice of the Peace for Dumfriesshire. He had completed his seventy-eighth year, and is survived by two sons and a daughter.

Mr. Badock.

The death, on April 25, at Hillcrest-parade, Leigh-on-Sea, Essex, is announced of Mr. John Barlow Badock, in his eighty-first year, who, in 1876, was elected a Fellow of the Royal Institute of British Architects.

PATENTS.

APPLICATIONS PUBLISHED.*

8,379 of 1911.—William Arthur Hiscox: Apparatus for drying stone or other similar material.

8,658 of 1911.—Benjamin Willetts-Adshead: Firegrates for domestic or other such purposes.

8,798 of 1911.—Koloman Brüll: Electrically-controlled grab-hoist gear.

8,808 of 1911.—Karl Alt: Cooking-stove.

9,147 of 1911.—Percy Edgar Beaumont: Slung cradles or staging for builders and the like.

9,173 of 1911.—William Henry Haysom and John Alfred Cole: Chimney-pot to prevent down-draught.

9,240 of 1911.—Maxwell Mayhew Upson: Concrete piles.

10,047 of 1911.—John James Davidge Clemenson: Chimney and ventilating-shaft tops.

10,927 of 1911.—John Patrick Tye: Manufacture of tiles and the like.

18,707 of 1911.—Joseph Richard Parker: Knot-holders for the cords of window blinds.

21,353 of 1911.—Joseph Pfarrhofer: Warming-ovens.

22,239 of 1911.—Hedley Button: Roof and wall coverings.

22,313 of 1911.—James Wilson McKinnon: Sanitary siftless boxes.

26,163 of 1911.—Karel Otto Slingervolt Ramondt and Errit Jan Vellema: Revolving doors.

26,269 of 1911.—Antoine Pelsmaekers: Combined gas and coal stove.

26,656 of 1911.—Jean Ribeyron: Stone-crushing machines.

3,621 of 1912. -Edwin Thurnham Palmer and Edwin John Palmer: Suspended scaffold.

4,968 of 1912.—Richard Biel: Sliding windows.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

PRICES CURRENT OF MATERIAL

**** Our aim in this list is to give, as far as possible, *average* prices of materials, not necessarily the lowe Quality and quantity obviously affect prices—a f which should be remembered by those who make use this information.

A PICCADILLY BLUNDER.

THE present condition of the operations rendered necessary by the rebuilding of the frontage of the small building forming one angle of the Piccadilly Hotel block is shown in the view we publish herewith.

It has always been a matter for regret that at the time the hotel was built it was not found possible to acquire this corner and include it in the general scheme, so that the whole block could have been treated as one complete building.

But although an opportunity to obtain a complete architectural composition could not be utilised, it had always been hoped that when this corner was rebuilt and set back to the new frontage line the fresh opportunity thus afforded to obtain at least some general harmony of effect would not again be thrown away.

A twelvemonth ago we referred to this

aspect of the matter; but now we regret to learn that instead of endeavouring to balance the gable at the other end of the hotel it is intended to rebuild the old front exactly as it was before, thus perpetrating what we cannot but feel is a hopeless blunder which will remain an eyesore for years to come.

We understand this decision has been arrived at owing to the fact that the occupier of these corner premises considers that a repeat of the western gable of the hotel would be quite unsuitable for the purposes of his business.

We quite sympathise with his point of view, and if any attempt was made to force an exact repeat of this gable upon him, fenestration and all, we cannot be altogether surprised that he refused, however much we may regret the result of his refusal.

From the architectural point of view, however, it is by no means necessary to repeat a gable feature by feature in order to obtain balance and a general effect of symmetry, and what must, we think, be obvious to anyone is that if the matter had been rightly handled some arrangement could have been arrived at which would have given the occupier a reasonable elevation suitable to his purpose and yet have preserved a sense of architectural unity. It should have been quite possible, we imagine, to balance the mass and general outline of the western gable while varying the window openings and other details to meet the peculiar requirements of the building.

The whole incident is deplorable enough, and no credit to the way such things are managed. Did we possess any reasonable system of architectural control over our streets it is no doubt true that such a ridiculous situation would never in the first instance have been permitted to arise. But we cannot help feeling that with a little intelligence and architectural insight into the possibilities of the situation as it now exists its worst results might have been avoided.

REGISTRATION AND PERSONAL QUALIFICATIONS.

Of all the questions which will be brought to the front as the proposals for Registration take a more definite shape none seem to us of more importance than the method whereby it is, or will be, proposed to ascertain who is fit to be registered and who is not.

Although it is no doubt permissible for any society to set up its own standard of efficiency and to make regulations for admission to its membership solely in accordance with its own ideas, as soon as it is proposed to make these regulations obligatory upon all who wish to enter the profession of architecture the position seems to be somewhat altered. The whole question assumes a wider and more serious aspect, and must be considered from the broadest possible point of view.

If we try to consider it in this way one of the first reflections that must occur to us is that it is advisable to begin at the beginning, and so arrange our methods as to encourage the right type of man to enter the profession and to discourage the wrong type. This appears to be the first essential. We cannot make good architects out of bad material. However good a system of training and of examination may be, it will never produce an architect in the best sense of the word unless we have the right material to work upon. We should view with considerable suspicion any method of Registration or examination which ignored this essential point or relied entirely upon setting up a barrier at the end of the student's career which the unfit would find it extremely difficult to pass without making any effort to discourage them from wasting their time in the endeavour to do so.

Apart from the injustice and waste of energy involved, it seems only reasonable to suppose that if only those who had the necessary personal qualifications were allowed to enter the studentship stage it would be far easier to arrange a satisfactory system of education and to frame a reasonable examination or other method of ascertaining whether they have acquired sufficient technical knowledge and skill to justify their Registration.

It is so much easier to teach or examine in architecture or to discuss it with those who have a natural instinct for it than with those who have not. The whole question is simplified if a barrier beyond which the personally unsuitable cannot pass is erected at the beginning of the student's career rather than at the end.

It should hardly be necessary to insist upon so obvious a truism, yet it appears to be overlooked by our present methods, which permit a student to spend considerable time in the profession before finding out that he has not the special qualifications and aptitudes necessary to genuine success, and which also permit and even tend to encourage the idea that general ability and good education are all that is required.

Neither should it be necessary to dwell on the unfortunate fate of the square peg in the round hole—the man of first-rate ability and high ambition who has been allowed by an inadequate system to drift into a false position and to realise when too late that the real success he might have achieved in some other more suitable profession is beyond his reach in architecture.

From every point of view it appears essential to make more strenuous efforts to obtain the right material from which to fashion the architect of the future. A process of selection should be instituted, and this process, we think, cannot begin at too early a stage in the life of the student. In fact, no student ought to be encouraged or even allowed to propose to be an architect or to present himself for the Institute Preliminary Examination unless he has given proof of special taste and aptitude. That so many without these tastes or aptitudes do present themselves suggests a lack of intelligence or organisation on the part of those responsible for their education up to this point, and the fact that so many are permitted to pass is the defect in our methods to which we draw attention.

We imagine that all headmasters of secondary or public schools would be perfectly competent to give a reliable opinion as to the aptitudes of all boys leaving their schools, and that unofficially a good deal of advice is, as a matter of fact, given by them on the choice of career.

If it would not be possible to insis that every applicant for admission to th profession should produce a certificat from his headmaster or college tutor tha he is a fit and proper person, at leas some definite report or opinion might b asked for which would enable a correc judgment to be formed as to his genera tastes, aptitudes, and type of mind.

In addition to this it might be we if some more definite process of selectio was instituted in the profession itself.

The idea is not a new one. It is, w believe, adopted by the Admiralty wit reference to all candidates for admissio to the Navy, who have to satisfy board of admirals, by personal interview that they are the material out of whic the right type of officer can be mad before they are allowed to take the firs step towards this career.

Although the same method might no be exactly applicable to candidates fo admission to the architectural professio there seems no reason why something o the same lines should not be attempted— possibly a special preliminary schoo from which no student would be allowe to pass without the certificate of a boar of qualified judges that he had th necessary personal qualifications. Th period of observation need not be long and those failing to satisfy the boar within this period would be saved fro wasting further time in an unsuitabl profession.

Although we quite see the desirabilit that every candidate for the professio should have received a good genera education, we think it is of equal or eve greater importance that he should posses the requisite personal qualifications with out which all knowledge and all technica training is a vain thing.

If Registration is going to impos any test of natural ability as a bar to th entrance of the profession—and unless i does so its usefulness might perhaps b questioned—this test should surely, i fairness to the student, be applied at th very beginning of his career, and it shoul not be beyond the scope of professiona ingenuity to discover a satisfactor method of applying it.

THE ROYAL ACADEMY EXHIBITION:

ECCLESIASTICAL WORK.

An exceptionally large proportio of the Architectural Room a the Royal Academy is this yea given up to churches and othe ecclesiastical buildings. A large propor tion of the work reaches a high standard and indicates that the spirit of the Gothi revival still exercises a strong hold o a large section of the architectura profession.

In making this statement we would no wish to be understood that the manner o the XXth century in the handling o Gothic is similar to that of the XIXth The influence of Sedding and Bentley ha made that impossible, and at the presen time we see much less of the rigidl archæological repetition of tradition forms, and much more consideration o the building methods suited to th requirements of the day.

Our architects seem to have recognised that elaborate detail, developing naturally when work was approached in the spirit of religious devotion, is no longer a characteristic mode of expression, and have consequently, while aiming at the effects of quiet dignity and subdued light characteristic of Gothic, made a movement towards simplicity of effect quite in harmony with an attitude of mind more philosophic and less emotional than that of the Middle Ages.

Typical examples of the tendency referred to are the Church of the Annunciation (1671-74), by Mr. Walter Tapper, and the Church at Mitcham, by Mr. H. P. Burke Downing (1678), while the Church of St. Peter, South Wimbledon, by Messrs. Greenaway & Newberry (1682), shows similar characteristics. Mr. Temple Moore's work is this year rather less distinguished than usual, though balance and proportion are carefully studied in his Pusey House, Oxford (1693), and his Hostel of the Resurrection, Leeds (1694). The same architect's design for a Chapel at Mirfield, Yorks (1680), shows the building on high ground firmly strutted from the hillside by a pair of flying buttresses enclosing a stairway. The idea is a striking one, but we cannot help feeling that the long ramps of the buttresses over-emphasise an effect that would be natural and legitimate if carried out with a little more restraint.

Professor Pite's interior of Uganda Cathedral (1687) is a charming drawing, and enables us to realise the effect of his building, the general design of which was exhibited last year. In this case the simplest treatment only was at the architect's disposal, and both plan and detail look almost primitive in their simplicity; yet by a masterly handling of the distribution and treatment of column and pier, the gradation of height and the distribution of lighting, the result promises far better than many a more costly and elaborate work.

A fine drawing (1603) shows us the interior of the new church in Kingsway, by Messrs. Belcher & Joass, rather narrow in its general proportions, covered with a barrel-vault, all severely plain, except for the relief imparted by decorative painting concentrated in the central portion. We confess to a doubt as to whether the somewhat arbitrary distribution of this decoration would impart quite the same charm to the building as it does to the clever water-colour portraying it.

The Byzantine design for St. Joseph's, Aldershot (1656), by Messrs. Poulter, merits attention, and St. Andrew's Church, Frimley (1699), by the same hands, is a pleasantly unassuming piece of work. The Burial Chapel, Falkland (1692), by Mr. Reginald Fairlie, is vigorous and picturesque in treatment, without sacrificing delicacy and refinement in its detail.

Worksop College Chapel (1663), by Sir Aston Webb, is broadly handled, and indicates its purpose at a glance; it is always gratifying to see temptation successfully resisted, as when the large church does not emulate a cathderal or the private chapel the arcades and apse of a church.

Mr. Caröe shows two churches illustrated by rather hard and unsympathetic drawings which deprive them of any chance of sympathetic appreciation; while the designs certainly appear to lack an organic unity of conception, they would certainly gain if the presentment of them took a more gracious form.

Numerous other designs will deserve attention as meritorious in whole or in part, and the few—we may say the very few—that are either definitely bad or merely negligible we may safely leave to the tender mercies of the individual critic.

NOTES.

Southwark and St. Paul's Bridges. We are glad to see that the City Corporation now recognise the claims of architecture in bridge design, and have associated Sir Ernest George with Mr. Basil Mott in the reconstruction of Southwark Bridge, and that the Bridge House Estates Committee has decided that another eminent architect shall be associated with the engineer in the design of St. Paul's Bridge. It is most satisfactory to find the principle established, or rather re-established, that bridges are as much a question of architecture as of engineering, and we sincerely trust that the architects, who have been so long excluded from this branch of their art, will be able to rise to the occasion and justify their restoration to the position from which they should never have been deposed. We fear that the general view of the architect's function in connexion with engineering is that when all practical questions are decided he shall come in to finish off the work by means of minor ameliorations and decorations on a predetermined structure. This is quite a mistaken idea; broadly speaking, the engineer treats his design on a purely economic basis, disregarding any question outside the most efficient method of fulfilling the varied requirements, such as those of water and land traffic, economy in construction, etc.; one of the most important factors in bridge design is that of scale in relation to the surroundings, and this is strictly an architectural question. Thus one may conceive that it would, in some instances, be more convenient to span a river in one leap of 1,000 ft. or more, although such a bridge might unscale and wreck the appearance of a whole city. If such a span had been decided on, of what avail would it be to consult an architect on the curve of the cantilevers or the terminal piers to the gigantic girders?

The L.C.C. Hall. Many of our readers must have been struck by the apparently slow progress of the new London County Hall. We should be the last to advocate an undue hastening of any great work that demands the most careful consideration at the hands of the architect, but, according to Mr. F. L. Dove, who, as one of London's leading contractors, is surely in a position to judge, "the delay is mainly due to the complicated system that has been devised in regard to the selection of architect and design." It is an open secret that the design has been shuttlecocked about between the original designer, the Superintending Architect, and the Establishment Committee, with the result that it has undergone constant change not invariably to the advantage of its architectural effect. Doubtless our readers will remember that at the time the conditions of competition were issued a strong protest was made at the Institute against the system of divided control, when it was predicted that difficulties would arise. It is now becoming evident that these predictions are being fulfilled, and it may be hoped that this example may act as a warning in future cases where such an arrangement may be contemplated.

The London University Site. Incidentally in the discussion at present being carried on of the possibilities of various sites for our hoped-for University of London, visibly and coherently embodied and brought together in one group of buildings, there crops out our English view of the qualities desirable in and proper to an urban park. The latest example is a letter from Mr. James Boyton. As he points out, the upshot of the controversy concerning the position of the King's Memorial was a general decision that the fewer statues there were in our parks the better. The quality of most of our monuments is admittedly poor; but this is merely an adventitious support to the essential view of the matter, which is, briefly, that a park in a town is merely a piece of country left isolated, and should be kept in every respect as nearly as conformable to that ideal as the circumstances of the case will permit. Mr. Boyton points out that the general objection to the proposal of placing the University in the present Botanical Gardens is just another aspect of the same general feeling—which, of course, it is. Useless, we suppose, to point out that an urban park should not try to be rural; that verdure in a town gains immeasurably by contrast with the ordered forms of civilised building. As things are, Regent's Park is, in our view, enhanced by the stately, if rather dull, classic architecture in which it is set. The new Bedford College buildings, we agree with Mr. Boyton, are distressing, but not so much because they are buildings as because, though good enough of their kind, they are of the wrong order here. We think the Botanical Gardens should gain rather than lose by the erection of a dignified group of University buildings of a great classical kind in their midst.

Another Suggested Site. A correspondent to the *Times* makes the suggestion that the Foundling Hospital might be taken over for the purposes of the London University. The entire area of this site is nearly 10 acres, four times that of the detached blocks at the back of the British Museum, and it is moreover open on three sides to public gardens, thus possessing a value in excess of the actual area. The position would be a convenient one, though perhaps a little further east than an unrestricted choice would dictate. From the point of view of the Hospital it

would certainly be desirable to have the opportunity of removal to a more rural position. One note of warning only: if the choice of the University falls on the Foundling Hospital they must be impelled to recognise that the chapel and its immediate surroundings would have to be embodied in its building scheme.

Civic Amenities.

WHILE our American cousins exercise their ingenuity to the extreme of human endurance in the matter of street advertisements, which are illuminated and move in an eye-catching manner almost beyond toleration, the authorities in this country seem disposed to look with increasing disfavour on the too-prominent display of trade announcements. Whether this result is due to such semi-private efforts as those made by Mr. Richardson Evans and at the Institute, or to public opinion, it is a fact which should serve to encourage those who hope that in time all city and urban advertisements may be controlled with an iron hand. It is an old cry that the beauties of the country are seriously threatened by patent medicine and other manufacturers, and the advent of the motor-car has brought new cause for complaint in regard to commercial enterprise. Much remains to be done in the way of protest in country and town, moving and flashing lights being particularly objectionable in London and elsewhere. A definite and desirable check has been given to the progress of the street advertiser by the rejection (by forty-five votes to thirteen) of the recommendation by the Highways Committee that the London County Council should permit an announcement on the railway bridge over Southwark Bridge-road. That so large a majority should have spontaneously realised the objections to the proposal shows that the conscience of the public is awakening to the demand for the preservation of our streets from the blatant enormities of the advertiser.

ARCHITECTURE AT THE ROYAL SCOTTISH ACADEMY, 1912.

THE number of exhibits in the Architectural Room of this year's Royal Scottish Academy is fifty-nine. Of these sixteen, all small, represent contemporary Scottish architecture, whilst seventeen, two of them about 10 ft. square and almost all of large size, are the work of French architects. The remainder are buildings outside Scotland or sketches, none of them of great importance. To the inquirer this state of affairs is disconcerting. Is there, indeed, no Scottish architecture? Buildings of some importance have been begun or completed in Scotland during the year; town-planning schemes are under consideration in many localities; yet no sign appears upon the walls of the Royal Scottish Academy. To this problem we shall return, but first we may consider the few Scottish works which we have.

The only Scottish buildings of any architectural interest are the Perth City Hall and the Catholic Church at Troon, Ayrshire. Neither is large. The former, by Messrs. Clifford & Lunan, is a well-designed, sober building of the type which competitions have made familiar. The Church at Troon, by Mr. Reginald Fairlie, is a typical example of the younger school of domestic and church building. It is based firmly on the local traditions of the XVth and XVIth centuries, but these are treated very freely. The building is well massed and very reticent in ornament. The influence of Sir Robert Lorimer is evident in this, in Mr. F. C. Mears' addition to St. John's Chapel, Canongate, and in Mr. Richardson's angel-screen, St. Baldred's, North Berwick. It is to the work of this school that we may look for the future of Scottish architecture.

The work shown by the more prominent architects is unworthy of their names. Sir Robert Lorimer is represented by a small frame of photographs of the restoration of Pittencrieff House, at Dunfermline, good, but not a work of importance. Messrs. Burnet & Sons show a sketch of a hospital. Mr. A. N. Paterson shows a commercial building, a church and a villa, none of them meriting particular notice. Mr. Tarbolton has a very "Gothic" study; and Messrs. Honeyman, Keppie, & Mackintosh a very "French Renaissance" bandstand, which only attracts attention as bearing the name of an architect whom we had associated with a wilder school of design.

There is nothing else.

Amongst the other works the only building of any importance is Sir Aston Webb's new Royal School of Mines, a dignified if slightly dull building, with a central feature which somewhat recalls the arch of Constantine.

We may now turn to the principal exhibits. Dominating two of the four walls are two immense stretchers of a scheme for the restoration of the Church of St. André at Chartres, by Professor Raoul Brandon. He also shows a large vividly-coloured sketch of the interior. The drawings are executed to a large scale, with extreme care, shaded delicately in water-colour, titled with large illuminated capitals and partly legible Gothic script, and adorned with numerous figures in fancy dress.

The Church of St. André at Chartres is an unimportant building of the XIIth or XIIIth century, to which a choir was added in the XVth and a Lady Chapel in the XVIIth century. The church was destroyed in 1793 and finally desecrated and burnt in 1865.

The choir and Lady Chapel were built on bridges spanning the river. Bridges, choir and chapel have long ago disappeared, and it is this vanished part which Professor Brandon has restored in the semi-Renaissance Gothic of the XVth century. So far as we know there is little historic or archæological proof for the greater part of this restoration. No distinction is made on the drawings between the restored parts and the remains still in existence, and the drawings seem to convey rather the designer's idea of what might now be built than any reasoned statement of what was the original building. The scheme is, in fact, an elaborate student's essay in historic design. As such it is unfortunate that neither plans nor sections are shown, and that, masonically, the stone jointing is anything but mediæval. It is difficult to criticise seriously two elevations and an internal perspective sketch. Or are we only asked to admire their draughtsmanship?

Next in importance is a set of measured drawings, by M. Louis Gautier, of the "Chapelle de Rocamadour-Camaret, Finistère," "relevé avant l'incendie." It is well that even the least important historic monuments should be carefully recorded and fortunate when this is done before they are burnt, and these drawings are marked by great care and completeness. But, careful though the drawings are, it is not necessary that a small and uninteresting French chapel should occupy a space of some 14 ft. by 4 ft. on the walls of the Scottish Academy. In addition to these large works a number of sketches of French domestic work are shown, clever and dashing in their presentation. Of the really great modern French work, the municipal buildings theatres, railway stations, of those buildings from which we have so much to learn, there is nothing.

It is a little difficult to account for this collapse in the Architectural Room. exhibit of the working drawings of Thistle Chapel or of the Usher Hall wo have been of interest to architects. A f town-planning schemes would have terested the public. In place of this we ha academic French draughtsmanship.

Apparently the Scottish architects ha ceased to exhibit in the Scottish Acade If their works are to be pushed into corn in order to accommodate 10-ft. stretchers, t is not surprising, for, in the presence of th stretchers, anything smaller simply vanish The architectural exhibition of the Ro Scottish Academy is a fiasco this year, a it is to be hoped that the archit Academicians, none of whom exhibit. a the architect Associates, of whom th exhibit, will bestir themselves to produ something more worthy next year.

RENAISSANCE SCULPTURE A THE BURLINGTON FIN ARTS CLUB.

HOWEVER much one may be inclined appreciate the art of the Italian Renaissan there are certainly moments when one inclined to regret the dominance of influence. Its authority was so ov powering that if it did not precisely k it, at any rate, retarded the developme or modified the direction of national art many other countries. It had this effe in regard to architecture, if not in regard the type of work with which we now ha to deal. The exhibition at the Burlingt Fine Arts Club presents one of the mo interesting phases—the plastic phase of t art of the Italian Renaissance. At the exhibitions one may be sure of a choi selection, supplemented by a scholar commentary in the shape of catalogu We cannot speak too highly of Mr. Maclagan compilation on the present occasion; h Introduction is as concise a *résumé* as y have seen of the history and process employed in the production of bronzes an other phases of plastic work. The specimen are largely confined to works of a modera or small scale, and include some maste pieces from the collections of Mr. Pierpo Morgan, the Earl of Wemyss, Mr. Heseltin and other collectors. The exhibition is part cularly rich in bronzes, although the varie of materials represented is one of its most i teresting features. The majority of the large works are in relief. The most notable of thes perhaps, from a popular point of view, is th St. Cecilia, usually attributed to Donatell which has been made familiar "in ever conceivable form of reproduction." Th well-known casts and photographs, howeve do not represent the colour of the black ston in which this beautiful profile is modelled Placed, as it is here, in an excellent light, th lines gain something in subtlety and di tinction from the original and darke material. The St. Cecilia is not, it shoul be stated, a definitely authenticated work o Donatello; the catalogue suggests that may be by Desiderio da Settignano. Man of the other works are also attributions, i which there is nearly always risk of error There are numerous reliefs of "The Virgi and Child," and kindred subjects in mar.l stucco, and other materials, achieved wit varying degrees of technical excellence an expressed with a certain formalistic sentimen The mask of a woman by Francesco Lauran possesses a more human touch of beauty its expression is almost as temperament and illusive as that of the lost Mon Lisa. There are numerous works b Michelangelo, or ascribed to him, in cluding a relief in stucco of "Christ take down from the Cross," a group of ninetee figures; two bronzes, "Juno" and "Virtu and Vice," by Benvenuto Cellini, as well some medals; and two characteristic bronze by Giovanni Bologna. The more decorativ aspect of the collection is represented by th

work of Riccio and Caradosso in exquisitely wrought lamps, hand-bells, sword pommels, inkstands, and other objects of the kind. A medal of Bramante, by Caradosso, will be especially interesting to architects. This is mentioned by Vasari, and its date is attributed to 1506, or thereabouts, when Caradosso had recently settled in Rome and Bramante was beginning his work on St. Paul's. Mr. Maclagan's Introduction to the catalogue translates extracts from the Dialogue "De Sculptura" of Pomponius Gauricus, an early XVIth-century authority on artistic processes, from which we make a quotation, as it helps also to explain processes of thought prevailing in Italy at the time:—"And, indeed, I think no reason remains why you should hold that I have failed you, for I have explained the methods not only of the one true art of sculpture, but also of the whole of statuary. For it is to this one art that all others tend, and are related, even as other arts and sciences are related to philosophy itself." The essential unity of the arts was one of the pet theories of the time; the author's inference that this unity existed in an appreciation of plastic form is surely not wide of the mark with regard to the Italian Renaissance. It was indeed the age of the plastic arts, and the enduring vitality of the whole range of artistic expression, including architecture, of this period is obviously in a large measure due to this plastic sense of things.

DESIGNS FOR MEDICAL SUPERINTENDENT'S HOUSE, GREENWICH INFIRMARY.

THE Greenwich Guardians had a limited competition for this house, which was to cost not more than 1,000*l*. The Guardians themselves were the assessors. It is a pity that architects will compete under such conditions, for, as may be expected, the selection the Guardians have made is decidedly open to question. The successful design is just the speculative builder's idea of a house both in plan and elevation; it has the ordinary central passage hall and two rooms on either side, without much consideration as to aspect or prospect. The kitchen, for instance, faces south-west, and the dining-room looks on to the old men's wards of the infirmary when it might just as well have overlooked the garden.

"Kent" has a well-arranged and carefully-thought-out plan—a central hall with the rooms grouped round it, well placed as to aspect and outlook. On the first floor there are five bedrooms and bathroom and water-closet, opening from a spacious central landing. The elevation is in purple bricks, with red-brick dressings to the windows and rusticated quoins to the angles. A wood cornice and green slate roof give a pleasing effect to the whole. This design, in our opinion, should have been placed first.

A design under the device of a green "Witch" comes, in our view, next in order of merit. It is very similar to "Kent" in external design, but the plan is not quite so well managed.

"S. W." (device in a circle) sends a picturesque design which would have been very pleasing in execution, but the plan is spoilt by dark passages. This design was placed second by the Guardians.

Both the premiated designs offend against one of the conditions which alone should have disqualified them from a place. The condition required that the north wall of the house should be 27 ft. from the boundary wall of the site. The plans placed first and second each have a two-story wing within that 27 ft. limit. This is unjust to "Kent" and green "Witch," but they only have themselves to blame for entering a competition without a professional assessor.

DESIGN FOR A TOWN HOUSE.

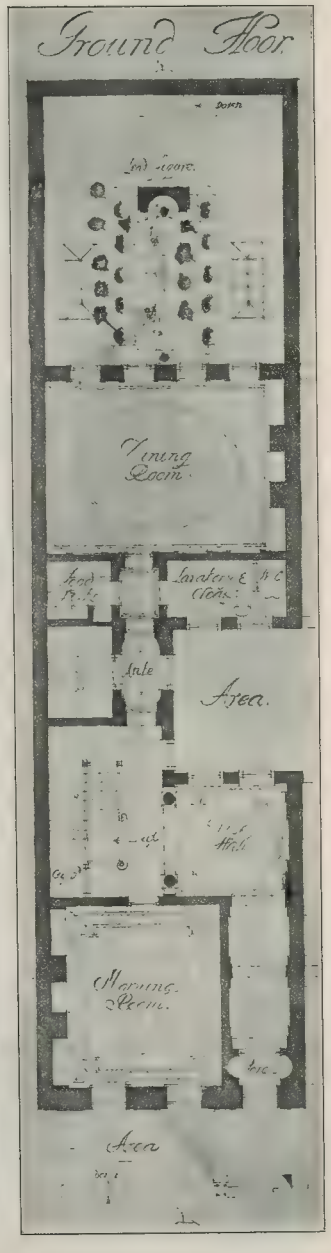
THIS design is an effort to solve the rather difficult problem of planning a house and lighting it conveniently in a space confined on three sides. An effort was made to get a simple plan, with a minimum amount of dark corridor space. As regards the architectural character of the design, it was kept simple and refined, the ornament being applied in two bands, at the

first-floor level to mark the principal rooms and on the cornice.

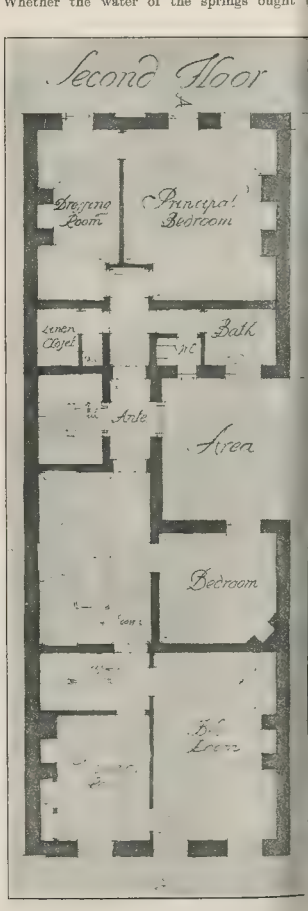
Some attempt was made to get an effect of colour into the façade by contrasting the lead of the attic story with the Portland stone of the front, a contrast so well exemplified in many of Wren's buildings.

The design is by Mr. W. J. Roberts, M.A., A.R.I.B.A.

A PIONEER IN SANITATION.



AMONGST the Pepys manuscripts preserved at Magdalene College, Cambridge, and calendared in the latest volume issued by the Historical Manuscripts Commission, there is a remarkable paper on the sanitation of London written in Italian by one Alessandro Riccardy. It is undated, but from the dates of the other documents amongst which it appears must have been composed in the early part of the XVIIth century. As Mr. E. K. Purnell, M.A., who edits the volume, remarks, the paper is obviously "much in advance of the times." The following is a summarised translation of the curious document: -



Knowing the importance of good air, and having great affection for London, he wishes to put forward an easy plan for keeping that City free from the filth which affects its air. The Romans took great care in this matter, as do the Venetians now.

The situation of London, especially in the part of the royal palace, makes this easy, but a stop should be put to the washing of clothes and of flesh, and of other businesses of the kitchen.

As is shown by his model, all the aqueducts of the houses, those of the wells and those of the kitchens, terminate in a receptacle in the most convenient part of the courtyard. Rain may be allowed to go uncovered to the said receptacle or through the streets, as is usual, but the water of the wells and that of the kitchen, in order to avoid constant damp and smell in the house, must disappear in the same spot—that is to say, in the kitchen, and at the foot of the wells there will be made a hole into which the water will pour; from this hole a littl underground channel will carry the water, b its own weight, to the receptacle; that thi channel may never be blocked the apertur must be the breadth of four fingers, with small iron grating at the top, having hole the size of a finger and no more, so that th channel cannot fail to carry anything whic passes. Doing the same for the well, th water both of this and of the kitchen will b carried to the receptacle, which will be a ston cistern, 1 ft. underground, more or less, square of 1½ ft. or 2 ft. according to the house It will incline towards the street, with a mout 6 in. square, to which mouth will be joine a channel of the same size, which will go t the street, carrying the water by its weigh The exit of the cistern to the channel will hav an iron grating, as above, and the cistern wi be covered by a stone pierced in the centr with a hole large enough to take a ball c shoemaker's wax, with five or six small holes round it at discretion, to carry the rai water from the house, which will be directe to that place. If the channel, as it leaves th house, is near a neighbour's channel, they ma be joined, to save the expense, from the wa of the house to the stream in the street. A streets will have an underground sewer int which the channels of the houses will go, th said sewers being 18 in. wide and the sam height, more or less. If the channel of on street discharges into that of another, th latter must be larger. Thus will be carrie underground the foul water, instead of bein in the streets, and it will pass into the rive Whether the water of the springs ought

R.A. Schools, 1911: Design for a Town House.

By Mr. W. J. Roberts, A.R.I.B.A.

go underground or be allowed to take their ordinary course is a matter for the physicians.

The water running through the streets will be clear, not mixing with the kitchen water. but this also might go underground at small expense.

In Italy and elsewhere beasts are not slaughtered near the places of sale, but the butchers have fixed slaughter-places, generally on the river and somewhat above it.

At Antwerp house refuse has to be put at street corners or crossways, whence it is removed by carts. It would be better to put it in a corner of the house to await the cart.

The cost of the channels is estimated at 10d. per rod for the house channels and 28d. per rod for the public channel, taking the cost of bricks to be two ducats per 1,000. Existing lead channels can be used for other purposes; existing stone channels will serve the purpose. The expense of the street work should be found by the master of houses contributing to the Chamber of the Commonalty of London, or the latter should borrow at 15 per cent., and assess the total cost proportionately among the householders.

Every summer on a fixed day these channels should be flushed.

Arrangements should also be made to secure enough water in mill ditches; a sluice should control the flow of water into the ditch below the mill, which should be cleaned every five years and kept in repair by the millers. Common ditches also must be repaired every five years. In Tuscany such work is the duty of specially-appointed resident men.

As to the ditch which is situated almost in the middle of London, above the Cathedral Church, towards the Court [the Fleet], this comes from outside London, and has three bridges. If the houses which are upon the ditch have foundations so deep that the water cannot harm them, the ditch may be deep enough for the water of the river to come up to the third bridge. Nothing but water should be thrown into the ditch, and at its mouth should be a lock, without prejudice to the boats, so that the ditch may be flushed. This scheme assumes the houses on the ditch to have deep foundations.

Alternatively, the ditch should be deepened and the dirt thrown aside; then a frame should be made to the ditch, going down deep, the earth being thrown at the side mostly where the houses are, raising a wall of 3 ft. or 4 ft., as at Venice. Thus the adjoining houses might turn their sewers into it, subject to orders given by the City, forbidding any filth to be thrown there, and requiring that it should be kept in order every five years.

If called upon, for the benefit of the City, we will gladly do in her service whatever he can.

ARCHITECTURAL SOCIETIES.

The Society of Architects.

The seventh ordinary meeting of the Society of Architects for the Session 1911–12 was held at 28, Bedford-square, W.C., on May 9.

Mr. Percy B. Tubbs, F.R.I.B.A., Vice-President, having taken the chair.

Twenty-one nominations for membership and four for studentship were announced. The ballot was then taken, and the following candidates were declared to be duly elected:

As members:—R. H. Blackburn, Manningham, Bradford; H. Y. Boreham, London; B. Baikin, London; D. C. Davies, Merthyr Tydfil; W. W. Diggle, West Hampstead, N.W.; T. Dowson, Sandsend, near Whitby; J. Emery, Birmingham; E. Hale, Birmingham; J. R. Hall, Sheffield; A. C. Harbottle, Exeter; E. J. Harbottle, Exeter; H. A. Lane, Mansfield, Notts; H. V. Milles-Diamond, Chandler's Ford, Hants; J. E. S. Pritchard, Kidderminster; N. Richley, Durham; W. F. Ingrisson, Peru, South America; W. Southall, Watford; G. A. Sutherland, Wick; H. G. Walker, Whitby; J. E. Webb, Nottingham.

As students: J. V. Bowring, Eastwood, Essex; R. B. Craize, London; F. F. Hayward, Johannesburg; A. J. Johnson, East Dulwich, S.E.; F. R. Priest, London: T. Rayson, Watford.

Professor W. A. Scott, A.R.I.B.A., A.R.H.A. (member), then gave a lecture on "Grecian Architecture," illustrating his remarks by scans of lantern slides and drawings.

Northern Architectural Association.

From the Report of the Council of this Association for the fifty-third session we take the following information:—

The roll of members is now as follows:—Members, 91; Associates, 88; students, 44; total, 223.

The Corporation of Newcastle-upon-Tyne having asked the Association to appoint two representatives to attend meetings of the Sub-Committee of the Corporation formed for the purposes of Part II. of the Housing and Town Planning Act, your Council asked Mr. F. W. Rich and Mr. J. Oswald, as members of the Association with large and varied experience, to act in this capacity, and they acceded to the request of your Council.

Your Council, acting on the advice of the Practice Committee, have made representations to the Royal Institute on the question of the appointment of clerks of works, and have asked that the following suggestions be adopted as part of the policy of the Royal Institute:—

(1) That such appointments in future be made by the architect; (2) that the power of dismissal should rest with the architect; (3) that the salary be paid through the architect.

The Practice Committee have also given further consideration to the proposed amendment of the Royal Institute Schedule of Professional Charges, and your Council have submitted further suggestions to the Royal Institute on the subject.

Edinburgh Architectural Association.

A small party of the members of the Edinburgh Architectural Association visited Glasgow Cathedral recently, by permission of Mr. Oldrieve, H.M. Office of Works, and the Kirk-session of the Cathedral. Mr. John Watson, F.R.I.B.A., acted as leader, and explained the historical features of the building. The new roof, which is in process of construction, conforms to what is known to have been the original design, and is being carried out under the superintendence of Mr. Oldrieve. The party afterwards proceeded to the new Mitchell Library in North-street, where they were received by Mr. F. T. Barrett, the Librarian. In the absence of Mr. W. B. Whitie, the architect, Mr. Andrew Brown, clerk of the works, conducted the party over the building.

ARCHÆOLOGICAL SOCIETIES.

Sussex Archæological Society.

A special committee has been appointed by the Society and will issue a circular to the local authorities with a view to the protection of the lesser-known objects of antiquarian interest in the county. The Duke of Norfolk has been re-elected President, and Mr. F. B. Stevens, of Lewes, has been appointed Honorary Librarian and Curator of the Museum, for which the Society have acquired Barbican House. Miss Davidson has presented to the Museum a salting-tub of the monks of Lewes Priory. The Society's attention has been directed to the threatened demolition, for the purposes of cement works, of Caburn Mount, near Lewes, on the summit of which, at an altitude of 490 ft. above the sea level, are remains of ancient military earth-works.

THE SURVEYORS' INSTITUTION.

THE following candidates have passed the Final Examination:—

A. H. Abbott, Boscombe
R. G. Anderson, Cirencester
G. A. S. Atack, Preston
C. G. Atkinson, Wimbledon
R. P. Beaumont, Brighton
O. Bell, Streatham
W. A. Bell, Walsall
W. J. Bell, Milford-on-Sea
R. H. W. Bennett, Earl's Court
S. Bennett, Kingston-on-Thames
T. B. Blow, Blackheath
F. H. Bolton, Manchester
H. Booth, Halifax
A. F. Bourdas, Clapham
J. S. Bray, Holsworthy
F. Brown, London
N. E. Brown, London
R. H. Brückmann, Finchley
W. H. Budgen, Croydon
W. H. Budgett, Wood Green
A. Burgess, Liverpool
J. T. Burt, Leicester
*H. G. Bues, Dover
J. Carey, London
B. Chamberlain, Tulse Hill
R. T. Chapman, Lostock Park
E. R. Chilwell, Chiswick
P. L. Clark, Cardiff
F. A. Clarke, Bolton
H. Clegg, Derby
C. J. Coade, London
A. H. Colliver, Boxmoor
F. J. K. Conway, Liverpool
R. Cope, Islington
F. W. Coy, London
A. H. Crabb, Stratford
F. Crook, Stockport
W. H. Crundall, London
A. V. Daborn, New Malden
R. A. Dalby, Boston Spa
R. A. Dalley, Kidderminster
J. A. Dartnall, Leytonstone
L. A. Dashwood, Gnosall
O. F. Davidson, Newcastle-on-Tyne
H. C. Davies, Rock Ferry
W. A. Davis, London
W. Dean, Hucclecote
F. J. Drake, Gloucester
C. A. E. Eachus, Enfield
E. G. Eastman, Anerley Park
L. R. Edwards, Petersfield
A. O Egerton, Aspatria
R. D. Ellis, Lincoln
W. S. Ellis, Leicester
G. M. Emery, Broadstairs
H. E. English, London
E. A. Evans, Haverfordwest
P. Farrant, Taunton
E. G. Fisher, Cambridge
W. A. Foster, Oswaldtwistle
H. W. Froud, Christchurch
W. E. Garnett, Eltham Park
S. V. Gledhill, Colchester
A. C. Goulder, Cricklewood
D. N. Gow, Dollis Hill
J. R. Greenaway, Reading
D. Gregory, Colwyn Bay
F. C. Grimwade, Croydon
R. L. R. Crogan, Kensington
W. J. Hackett, Newcastle-on-Tyne
V. Hailey, Tring
R. G. Hall, Eastbourne
J. Hamill, Oxford
J. M. Hannon, London
A. G. Harding, Forest Hill
E. C. Hardy, Shepherd's Bush
R. W. Hawke, Colchester
E. D. Hine, London
E. O. Hines, Ipswich
R. A. Hobbs, Monmouth
W. G. Hole, Bath
H. T. Hooper, Thornton Heath
F. P. Horne, Hounslow
J. H. Houghton, Teddington
N. Howard, Bolton
A. Hughes, jun., Tipton
G. E. Hughesdon, Balham
E. A. Ireland, Putney
F. O. James, Bath
W. J. Janes, Wandsworth
F. W. Jeffery, Kensington
S. S. Jenkinson, London
D. S. Jennings, Hammersmith
W. H. Jennings, Kingston Hill
L. Jewell, St. Albans
H. T. Johnson, Rugby
F. C. Jones, Oxford
P. E. Jones, Westminster
R. K. Jones, Kensington
T. Jones, Wallasey
T. Jones, Lancaster
H. Kaye, Wakefield
L. Kennard, Redhill
P. E. Kennedy, Northallerton
A. Kirk, Manchester
H. L. Knapman, Southampton

* Galsworthy Prize.
* Crawter Prize.
† Penfold Gold Medal.

Scottish Candidates.

R. S. Aiton, Coldstream
W. Corbett, Glasgow
B. C. Douglas, Broughty Ferry
W. H. Howatt, Glasgow
J. Hume, Edinburgh
L. Jackson, Glasgow
D. M. Laird, Glasgow
J. Macaulay, Glasgow
C. Maclay, Glasgow
W. A. McRobbie, Aberdeen
H. H. McTaggart, Glasgow
J. A. Malcom, Largs
J. B. Morrison, Renfrew
R. D. Reid, West Glasgow
A. Young, Edinburgh

Irish Candidate.

G. D. Taylor, Armagh

The following candidates have passed in the Direct Fellowship Division :

C. A. Aish, London
E. M. Bate, Frinton
G. T. Brown, Sunderland
F. E. Coates, Sunderland
C. Davis, Shepherd's Bush
E. J. Dunn, Harrogate
R. J. Girling, Felixstowe
H. Hines, Newcastle-on-Tyne
G. C. James, London
H. B. Longley, Epsom
J. Mitchell, Carlisle
P. F. Storey, Surbiton
F. W. Turner, West Hartlepool

Irish Candidate.

J. Ferguson, Belfast.

Scottish Candidates.

C. J. B. Bryden, Glasgow
T. W. Hamilton, Greenock
W. Salmond, Dundee.

ENGINEERING SOCIETIES.

The Concrete Institute.

On the 9th inst. the annual general meeting of the Concrete Institute took place in the Institute's Lecture Hall at Denison House, 296, Vauxhall Bridge-road, Westminster, S.W., Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A. presiding.

The following were elected members of the Institute :—Mr. C. W. Ballenden (South Africa), Mr. S. Edwards (Barnstaple), Mr. C. T. Lewis (Ilford), Mr. H. Lingard (India), Mr. J. P. Pike (Southend), Mr. A. R. Sage (Brixton, S.W.), Mr. I. M. Sutherland (Victoria, Australia), and Mr. A. Graham (London).

The annual Report of the Council having been read by the Secretary, Mr. H. Kempton Dyson, its adoption was moved by the Chairman and seconded by Mr. Edwin O. Sachs, Vice-President Concrete Institute. The Report was adopted unanimously.

The Chairman then read the report of the scrutineers on the annual election of members of Council; this resulted as follows :—Mr. H. K. G. Bamber, F.C.S., Mr. H. P. Boulnois, M.Inst.C.E., Mr. Alexander Drew, M.I.Mech.E., Mr. Matt. Garbutt, F.R.I.B.A., Assoc.M.Inst.C.E., Major R. Napier Harvey, Mr. John Munro, Mr. A. Alban H. Scott, M.S.A., Mr. H. D. Searles Wood, F.R.I.B.A., Mr. L. Serraillier, Mr. T. B. Shore, Mr. R. W. Vawdrey, B.A. (Cantab.), Assoc.M.Inst.C.E.

The above form only a portion of the Council of the Institute, the total number of which is thirty-two, only a small number being due to retire each year.

The auditors of the accounts were appointed, and the Chairman then presented the medal which is to be awarded annually for the best paper read in each session. This is the first occasion on which the medal has been awarded, and it was presented to Professor Pite for his paper, entitled "The Æsthetic Treatment of Concrete," which was read in the 1910-11 Session. The paper appeared in the *Builder in extenso*, December 29, 1911.

Sir Henry Tanner, in presenting the medal, said Professor Pite's paper was a most interesting contribution to the literature of the subject treated, and it gave rise to some little discussion. He was glad that the Professor did not altogether object to what had been done and advocate something entirely new, because, he thought, they should have got into very much trouble. Professor Pite said we ought to start from the existing styles of architecture, and that seemed really to be the most satisfactory way of meeting the difficulty. There was no doubt that something would develop shortly, and the Professor had given a start in that direction. Perhaps the Royal Institute of British Architects might develop a discussion itself and so make some greater effort than had been done hitherto. He asked the Professor's acceptance of the small memento of their regard for him and his lecture.

Professor Pite, in reply, said his paper had dealt with an aspect of work in concrete that had not yet captured the imagination of members of the Concrete Institute, and he hoped it would in the future, as one could not but be sure that if the apparent fog that hung over progress in the architectural aspects of concrete construction were dispelled by a little clear light there ought to be a considerable acquisition of width and breadth to the operations of the Institute. So long as that subject remained unexplored and inexperimented with, so long the Institute would be looked upon as merely a body concerned with certain aspects of building only; and concrete construction—especially in its more prominent methods now—would be relegated to the larger, coarser, and greater class of building, when it might, if there were interest and enthusiasm and hope and light, be used for more monumental, more decorative, and more homely, and therefore much wider purposes. It seemed to him that since it was recognised that there was a field—a field for experiment, a field for movement, a field for intellectual thought, a field which connected a decent contract in concrete with an ordinary and regular course of architectural study, æsthetic consideration, then there would be the widened scope which their Special Committee so hoped for, and which they had, in a way, suggested by adding the word "Architects" to the title of the Institute. That widened scope would come, and a very broad and very large, and he would like to say very popular, appreciation of the possibilities of concrete, because the popular aspect of the subject was, of course, one closely allied to the commercial one. The commercial aspect and the popular aspect ought to make the Institute a very wide and a very important public body. He made one suggestion with regard to this which seemed to him was a practical suggestion—a suggestion not at all inappropriate connected with the honour that they have ventured most courageously to bestow, and that suggestion was that the subject should not be dropped, that the attention of architectural students and designers should be drawn to it. The Chairman had indicated that the Institute of British Architects did not pay much attention to it. That was perfectly right. He thought if he had said bluntly that they were prejudiced with regard to the whole subject of concrete he would have only spoken what he felt and what with some delicacy they knew he hesitated to express. The best way to disperse that prejudice would be to show what great and good designs could be perhaps imagined, because every castle had to be built in the air before it could be built on the earth by young and enterprising designers, and the institution by the Concrete Institute of an annual competition in designs would, he imagined, attract, at all events, a certain number of responses; but he was sure it would attract a few intellectual and careful thinkers on the subject of æsthetics. Those students who had little else to think about in their youth but the charm of design would turn with interest to such a competition. If the medal which they had now created and which was such an artistic object were bestowed with such monetary attraction, as either a special fund or some contribution from the Institute as it might be able to afford annually for a design (the subject of any design to deal with the simple architectural aspects, elevation and details suitable for application to or distribution in ferro-concrete, with, if necessary, any descriptive theory as to the method of design) he thought, without expecting too much in the way of hard labour from the competitor, the Institute would be put into possession annually of a large number of interesting artistic essays, that is to say artistic inventions, artistic designs, and would attract to itself the attention of students, and bring them to its meetings. The illustrations of deviations in ferro-concrete design would have a most important influence upon the whole subject. Anyone who took up the *Transactions* would say that was a live aspect of the question—a popular aspect of the question. Such illustrations would attract those of the general public who were very widely interested in the outward aspects of the buildings; they would attract the attention of art critics and others who certainly should be made conscious of the fact that a new effective building material has come into practical use; and the world would move as it always has moved in these artistic matters, slowly but with interest and life and with enthusiasm.

The Chairman, as retiring President, then installed Mr. E. P. Wells, J.P., as President of the Concrete Institute for the ensuing two years of office.

Mr. E. P. Wells accordingly took the chair and expressed his thanks.

Mr. A. Alban H. Scott moved a vote of thanks to Sir Henry Tanner, and Mr. William G. Kirkaldy, Assoc.M.Inst.C.E., M.C.I., seconded the vote, which was carried with acclamation, and Sir Henry Tanner replied.

The meeting then terminated. The annual dinner was held in the evening.

From the Annual Report of the Council we learn that the Institute had on April 30, 1912, 881 members, twenty-four students, and eleven special subscribers. The Council has in the past year been concerned with numerous technical and administrative matters.

One of the principal items occupying the attention of the Council and a Joint Committee of the Science and Reinforced Practice Standing Committees has been the consideration of the proposed regulations made under the provisions of sect. 23 of the London County Council (General Powers) Act, 1909, with respect to the construction of buildings wholly or partly of reinforced concrete. A draft of suggested regulations was submitted by the Superintending Architect of the London County Council to the Institute for its consideration, and the action taken was recorded in the annual Report for the 1910–11 Session. The 1909 Act referred to provides that the Concrete Institute, together with the Institution of Civil Engineers, the Royal Institute of British Architects, and the Surveyors' Institution, shall have notice of the Council's intention to apply to the Local Government Board for the allowance of any regulations as to the use of reinforced concrete in the county of London, and such notice was duly given at the beginning of December, 1911. The Institute's suggestions as to the amendment of these regulations have been sent to the Secretary of the Local Government Board and to the Superintending Architect of the London County Council, and in due course the Council of the Concrete Institute will be able to inform the members as to the outcome of such action.

In October, 1911, a proposal for widening the scope of the Institute was considered by the Council and referred to a Committee, who held a series of meetings and recommended that :—

Scope.

(*a*) Clause 3 (1) of the present rules does not limit the scope of the Institute to concrete and reinforced concrete, but that the clause enables the Institute to deal with iron (including steel), bricks, gravel, sand, cements, and other structural materials and their application.

Definitions.

(*b*) For the purposes of the Institute, structural engineering be defined as that branch of engineering which deals with the scientific design, the construction, and the erection of structures of all kinds in any material.

(*c*) Structures may be defined as those constructions which are subject principally to the laws of statics, as opposed to those constructions which are subject principally to the laws of dynamics and kinematics, such as engines and machines.

Title.

(*d*) After very long discussion, the Committee came to the unanimous decision that the term "The Concrete Institute" should remain in the title, and that it should have the first place in the title and that a sub-title should be added, so that the full title and sub-title should be "The Concrete Institute: an Institution for Structural Engineers, Architects, etc.," and that such description should be added to all documents wherever practicable.

Lectures and Examinations.

(*e*) An annual course of technical lectures on some branch of structural engineering be instituted.

(*f*) Examinations in structural engineering be held by the Institute once a year to test the scientific or technical attainments of applicants for studentship.

Subscriptions.

(*g*) An entrance fee of one guinea be required when the membership reaches 1,000.

Transactions.

(*h*) *Transactions* should be issued quarterly.

(*i*) Members should be requested to return the reports of discussions at meetings not later than seven days after receipt.

(*j*) Members be hereby invited to submit

note as to suggested papers covering all branches of structural engineering.

(*k*) New books received should be reviewed in the *Transactions*.

(*l*) A referendum be employed to ascertain the wishes of the members as to :—

1. The most convenient meeting place.
2. The most suitable hour of meeting.

(*m*) The time is not yet ripe for any change of rules, but that the suggestions in this Report should be worked upon for twelve months as a trial.

The Report of the Committee was approved on March 14, 1912.

The question of awarding a bronze medal for the best paper read in the previous session was decided by ballot among the members of Council, and as a result the medal has been awarded to Professor Beresford Pite, F.R.I.B.A., for his paper, entitled "The Æsthetic Treatment of Concrete."

Sir Henry Tanner has been appointed delegate of the Concrete Institute at the Congress of the Royal Sanitary Institute to be held in June next.

The International Association of Road Congresses have asked the Institute to appoint delegates to the third International Road Congress to be held in London in June, 1913, and delegates will be appointed after the annual general meeting has taken place.

Sir Henry Tanner's term of office as President expiring in May, Mr. E. P. Wells was appointed President for the ensuing two years.

During the present session a larger number of meetings will have been held than in any previous session, and next session it is intended to resume the course of Educational Lectures to Students which were begun last session. The work of the Institute is increasing, and it is hoped to extend the number of meetings next year and that the subjects to be dealt with will be of more general interest by reason of the extension of the scope to cover structural engineering generally.

A library is in process of formation at the Institute, and a number of donations have been received, but the Council would welcome the presentation of books, papers, and other publications on the subject of structural engineering generally, the funds at present precluding any large purchase of such works. A catalogue of works in the library will eventually be published and members will be enabled to borrow books.

As regards the work of the Science Standing Committee, the Institution of Municipal and County Engineers requested the opinion of the Concrete Institute upon a standard specification for concrete flags which they propose issuing, and the Commitee made a number of suggestions which the Institution has intimated will be considered in any revision they may make in the future of their specification. The standard notation for calculations for reinforced concrete which was drafted by the Science Committee and approved by the Council continues to meet with favour and has been adopted by the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects in their second report and by the London County Council in their proposed regulations covering the erection of buildings of reinforced concrete in London. Authors of text-books have also employed it and the American Joint Committee on Concrete and Reinforced Concrete have informed the Science Committee that they have the notation under consideration with a view to its adoption in any further Report they may make. The Committee have the following matters under consideration :—

(1) Reinforced concrete piles.
(2) A chemical test for steel used in reinforced concrete.
(3) The standardisation of attachments or joints in reinforced concrete.
(4) The adhesion of or friction between concrete and steel.
(5) A standard notation for calculations in structural engineering generally.
(6) A standard specification for reinforced concrete work.
(7) The effect of sewage on concrete.
(8) The effect of oils and fats on concrete.

The Tests Standing Committee have issued reports on "The Testing of Concrete, Reinforced Concrete, and Materials Employed therein" and "The Testing of Reinforced Concrete Structures on Completion." These have been discussed at ordinary general meetings of the Institute. The Committee have the following matters under consideration : —

(1) The effect upon steel of the presence of sulphur in aggregates.
(2) The grading of aggregates.
(3) The expansion and deterioration of concrete due to changes of atmospheric temperature.
(4) The effect of the use of sodium silicate on the surface of concrete as affecting reinforcing metal.
(5) The erratic results obtained by the Vicat needle in ascertaining the initial set of cement.

The Reinforced Concrete Practice Standing Committee have drafted reports on the subject of "The Standardisation of Drawings for Reinforced Concrete Work" and "The Consistency of Concrete," which have been discussed at ordinary general meetings of the Institute. The Committee have also had under consideration a reference of the Council for a report as to clauses in contracts for reinforced concrete work, but the Committee recommended the Council that they were of the opinion that the formulation of clauses in contracts was a legal matter, and the Committee did not feel they were capable of formulating such clauses. The Committee are still investigating :

(1) Methods of treating the surface of concrete.
(2) Cracks due to the expansion and contraction of reinforced concrete.

GENERAL NEWS.

Appointments.

Mr. F. H. French, the Sanitary Inspector to the Harwich Town Council, has been appointed by that body to be their Borough Surveyor. Mr. French will take up his duties on June 6.

Mr. R. B. Robertson has been appointed Architect and Surveyor at Windsor Castle, in the place of Mr. A. Y. Nutt, M.V.O., who has retired.

The Royal Institute of British Architects.

The meeting of the R.I.B.A. on Monday, when the well-known American architect, Mr. R. A. Cram, will read a paper on "Recent University Architecture in the United States," is called for 8.30 p.m. The name of the architect and the subject should ensure a good attendance of members.

The Royal Society of Antiquaries of Ireland.

A Charter has been granted, under the Great Seal of Ireland, to the Royal Society of Antiquaries of Ireland, of which Count Plunkett, Hon.A.R.I.B.A., is President.

The London Society.

The first meeting of the London Society will be held on Thursday, May 23, at 7.45 p.m., at the Galleries of the Royal Society of British Artists, Suffolk-street, Pall-mall East, to transact the necessary business and to elect a Council and Executive Committee and officers. The chair will be taken by Sir Aston Webb, R.A. The meeting will be followed by a public meeting at 8.15, when a paper will be read by Mr. T. Raffles Davison on "London : As it is, and as it might be," representing the views of the organising Committee upon the future work of the Society, with lantern illustrations. The chair will be taken by Lord Plymouth.

Home Arts and Industries.

The twenty-eighth annual exhibition of the Home Arts and Industries Association was opened at the Albert Hall on the 15th inst., and will be closed on the 18th. The work collected by the various stallholders is uniformly interesting, and shows that in the revival of home handicrafts the Association is doing excellent work.

Institution of Municipal Engineers.

A discussion on "Water Softening" will be opened by the Chairman of the S.E. District of the Institution in the Council Chamber, 4, Southampton-row, London, W.C., on Wednesday, May 22, at 7.30 p.m.

Bath Memorial to Jane Austen.

A memorial bust of Jane Austen has been set up in the Pump Room at Bath. It was executed and presented by Mr. Percy Fitzgerald, the donor also of the bust of Charles Dickens in the Pump Room.

Bacon Memorial, Gray's Inn.

Mr. F. W. Pomeroy, A.R.A., is the sculptor of the statue of Sir Francis Bacon which will be unveiled in South-square, Gray's Inn, on June 27. Bacon was admitted to the Inn on June 27, 1576 ; he was called to the Bar on June 27, 1582, and was Reader, Dean of the Chapel, and Treasurer of the Inn at successive periods in the interval 1588–1617.

Demolition of Old Buildings.

In the Parliamentary Papers for May 9 Mr. W. Thorne asks the Home Secretary whether he is aware of the statement made by the coroner at the inquest upon the bodies of three workmen who were killed whilst engaged in the demolition of some buildings upon the premises of the Gas Light and Coke Company at King's Cross, to the effect that more inquiries arose from the demolition of old buildings than from the erection of new ones, and that it would be beneficial if there was some law whereby the proposed demolition of buildings should be notified to an officer of the local authority and carried out under his supervision ; whether he is aware that the jury recommended that the local authority should appoint an inspector to represent them during the demolition of buildings ; and if he intends taking any action in the matter.

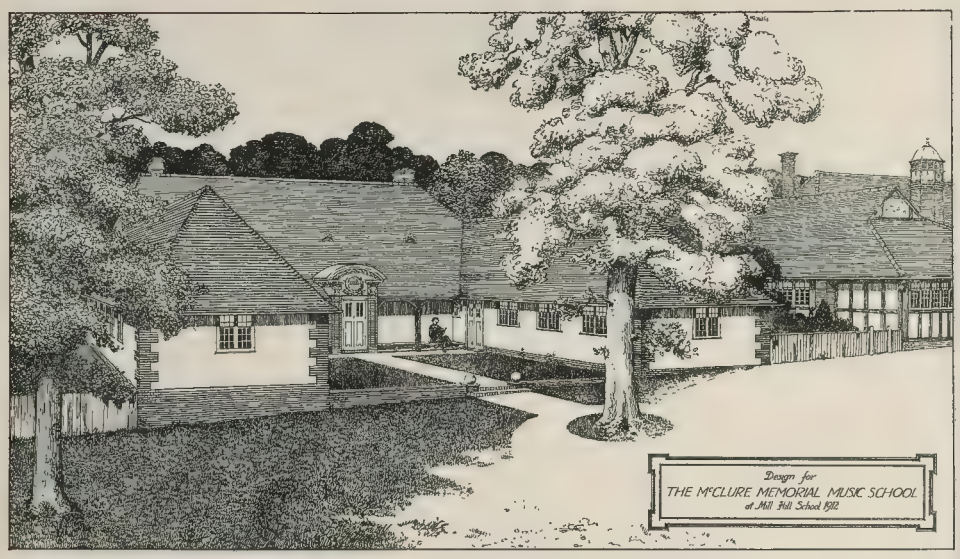
Mr. McKenna says he had seen a newspaper report of the inquest, but there had not been sufficient time for him to obtain a report from the coroner. The matter was one that could only be dealt with by fresh legislation. The Government already had a Bill in draft to deal with building accidents, and he would consider the present question in connexion with it.

COMPETITION NEWS.

Regent's Quadrant Competition.

As this competition is exciting considerable interest in the architectural profession, we give herewith a letter which we have sent to a large number of architects throughout the country.

"Dear Sir,—You have probably seen the announcement in our columns of the competition which the proprietors of the *Builder* have instituted for a façade for Regent's Quadrant, which, while accepting the present façade as a *fait accompli*, will continue it in such a manner as may not be open to the criticisms of the retail tradesmen for whom the premises are intended.



But you may not have seen the further announcement in the *Builder* of May 10 that Messrs. Swan & Edgar, whose premises occupy a large part of the site, are prepared to take an active interest in the matter, either by giving an additional premium to those offered by the proprietors of the *Builder*, or, "if practicable, a professional position which will enable the successful competitor to put his design into material form." The problem, though a difficult one, calls urgently for a solution, reconciling commercial needs and interests with the architectural dignity of a city.

Full particulars are given in our issues for April 19 and May 3, but in view of the widespread interest that the competition has evoked it has been decided to postpone the date for submission of designs to June 28."

McClure Music School, Mill Hill.

The drawings of the McClure Music School, Mill Hill, which we illustrate on the next page, were successful recently in a limited competition promoted by a committee of the Old Millhillians Club. The purpose of the building is to provide improved accommodation for the teaching of vocal and instrumental music and of art, and to commemorate the remarkable growth and prosperity of the school since Dr. McClure became headmaster twenty-one years ago. It is peculiarly appropriate that a music school should form this memorial, as Dr. McClure's own tastes have always inclined in this direction, and during his *régime* the school has provided an increasing number of music pupils. The school buildings occupy one of the finest and most commanding positions near London on the ridge of a hill, with a magnificent view southwards over wooded country to Harrow and even to Windsor.

The schoolhouse itself is the work of Sir William Tite, and was erected nearly a century ago, while other buildings have been added by Mr. Basil Champneys and by Messrs. Collcutt & Hamp.

The music-school site lies at the end of the hockey ground, and adjoins the scriptorium (shown on the perspective), which was built some years ago to honour Dr. Murray's great work on his Dictionary, partly written in a corrugated-iron shed beneath these trees, also the fine library recently presented by Lord Winterstoke, and the school tuck-shop. These three last-named buildings are grouped round a quadrangle, and the author of this design has aimed at following out the same lines in the music-school plan.

For the rest, the drawings are self-explanatory, and we need only add that they are the work of the architect, Mr. Martin S. Briggs, A.R.I.B.A., of 14, North Audley-street, W.

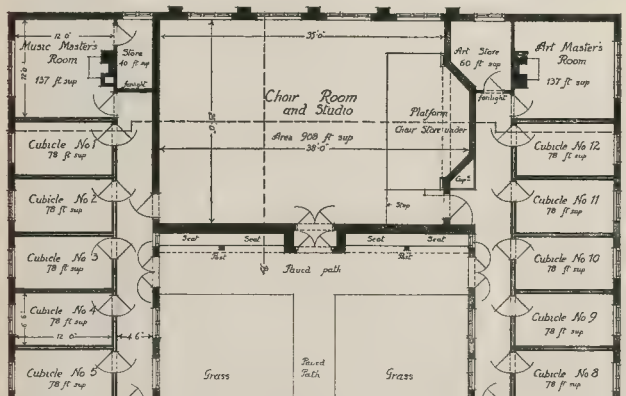
Proposed Extension to Swansea's Central Police and Fire Brigade Station.

The Sub-Committee appointed by the Swansea Town Council to deal with the competition for extensions to the Central Police and Fire Brigade Station reports that six competitors had submitted their schemes and designs. After carefully examining the various details of the designs they unanimously selected No. 5 as the most suitable. The letters of identification were then opened, the names of the competitors being (1) Messrs. Phillips & Vaughan (AA.R.I.B.A.), Newport, estimated cost of extensions, 16,000*l.*; (2) Messrs. Spier & Beavan, Cardiff, 12,000*l.*; (3) Messrs. Davies (A.R.I.B.A.) & Jenkins, Swansea, 15,100*l.*; (4) Messrs. C. S. Thomas (M.S.A.), Meager, & Jones (M.S.A.), Swansea, 14,230*l.*; (5) Mr. Ernest E. Morgan (A.R.I.B.A.), Swansea, 13,455*l.*; (6) Messrs. Popler (F.S.I.) & Allen (A.R.I.B.A.), Swansea, 14,566*l.* The Watch Committee, in accordance with the Sub-Committee's selection, recommended the appointment of Mr. Morgan as architect to carry out his scheme at a cost of 13,455*l.*, also that tenders be invited for carrying out the work.

Knavesmire Elementary School.

A public exhibition of twenty-nine of the designs, selected from the 203 submitted in competition for this school, will be held in the South Galleries of the Exhibition-building, York, from Friday, May 17, to Friday, May 31, between the hours of 10 a.m. and 5 p.m. Messrs. T. Mellard Reade & Son, were the Assessors in the competition, and Mr. J. T. Proffitt, of Walkden, near Manchester, was awarded the first premium.

Birmingham Blue Coat School.



We understand that architects have been asked not to proceed further with the plans for the Birmingham Blue Coat School owing to the probable change of site.

New Municipal Offices for Goole.

Competitive designs are invited by the Goole Urban District Council for the erection of Municipal Offices, suitable for a town of over 20,000 inhabitants, on a large plot of land in front of the Market Hall.

Architectural Association *Journal*.

The Council of the Architectural Association offer prizes of two guineas and one guinea ("although, of course, the honour would in itself be a sufficient reward") for a design for the cover of the *Journal*. Drawings must be sent in by May 25.

Ground Plan

Accepted Design for the McClure Memorial Music School, Mill Hill.

By Mr. Martin S. Briggs, A.R.I.B.A.

BOOKS.

The Construction of Lombard and Gothic Vaults. By ARTHUR KINGSLEY PORTER. (Newhaven: Yale University Press. London: Henry Frowde. Oxford University Press. Price 8s. 6d. net.)

MR. ARTHUR KINGSLEY PORTER'S book, "The Construction of Lombard and Gothic Vaults," adding, as it does, a new word to an old and attractive subject, should find many an appreciative reader without, as well as within, the ranks of the architectural profession.

The history, construction, and architectural charm of Gothic work having been exhaustively treated of by other writers, the reason for the origin of the style remained very largely a matter for speculation, and it is this part of the subject that Mr. Porter so ably elucidates.

Briefly reviewing the practices of Roman and Byzantine architects in the erection of brick and concrete vaults, with a minimum of temporary timber centering, the author proceeds to demonstrate that the essentially Gothic method of vault construction by means of exposed diagonal rib arches thrown across from corner to corner of a compartment had in the first instances a similar purely utilitarian object. He shows us that the diagonal ribs did for Lombard and Gothic masonry what the cunning disposition of brick courses had done in the hands of the ancients as

described by Auguste Choisy. They allowed, in fact, the infilling or covering of the vault to be built up "freehand in the air" instead of being pieced together upon a heavy, close-boarded centre, such as we should employ at the present time. The anxiety on the part of the Lombard builder to dispense with a good timber centering is not easily comprehensible to us at home in England, with a plentiful supply of sound Baltic timber always available, and knowledge of the principle of triangulation to enable us to take full advantage of its strength. It is, however, no difficult matter to understand a builder in a timberless land considering favourably any scheme that would enable him to dispense with the uneconomic collection of props and staves that constitute the supports of a modern Oriental centre, to which those of the Dark Ages might well have been similar. Examples of Lombard vaults mentioned and illustrated in the book clearly show the reluctance of the early Lombard builders to adopt the new principle of exposed diagonal arches. With the universal practice of the Roman world behind him, and with examples on every side of the beautiful suavity of the unbroken surface of Roman and Byzantine vaults, he may well have waited for the spur of necessity to drive him to the use of what must have seemed to him a somewhat barbarous expedient.

The question of stability must also have greatly exercised his mind. Roman and Byzantine vaults he could see about him and could judge of the wonderful tenacity of their concrete-like construction, even when submitted to the severe test of an earthquake.

Would the new form, with its exposed arch ribs, remain as inflexible and coherent? We know, and he must have suspected, that the older form was by far the more stable in proportion to the mass of material employed.

Economy and speed in the process of construction alone impelled the early use of the exposed diagonal ribs. In Lombardy, where the Classic tradition never entirely died out, "Only exceptionally was the rib vault employed except over naves." (The greater height of the nave would present difficulties to the erection of a primitive centre of improperly triangulated poles.) "It was never adopted in those regions of Italy where wood was abundant, and was generally abandoned when other means of erecting nave vaults without centering were discovered."

In France, where Byzantine methods had not gained so great a hold, the diagonal rib system was received with more favour, and soon became the normal and established practice.

Unlike the Italians, the French builders, far from disliking the appearance of the protruding ribs, became eventually so enamoured of them as to subordinate every other detail of architecture to the glorification of these features, originally introduced for purely economic reasons.

Much interesting matter is to be found in the book upon the special features exhibited by early vaulting. The text is ably and lucidly written, and should stimulate further study on the part of the reader rather than provoke the bitter controversy that so usually follows upon a treatise concerning any branch of Gothic art.

A respect for the simple forms and sound construction of the preceding Roman and Byzantine styles, which may be detected in the book, may possibly prove offensive to a small body who consider Gothic work as alone worthy of attention; but, as Mr. Porter presents his fact and draws his conclusions with the modesty of one who has a thorough grasp of his subject, even these will deal leniently with him. The many beautiful illustrations from photographs of well-chosen examples, together with good type and attractive binding, will make the book a pleasant as well as useful addition to an architect's library.

German Varnish-Making. By PROFESSOR MAX BOTTLER. Authorised Translation with Notes on American Varnish and Paint Manufacture, by ALVAH HORTON SABIN. (New York: John Wiley & Sons. London: Chapman & Hall, Ltd. 1912.)

THE American translator of this German book on varnish manufacture has added so many notes of his own that a considerable portion of the book is of American origin. There is, however, no confusion of the work of Professor Bottler with that of the translator, for the translation has been printed in such a manner that it is easily distinguishable from Mr. Sabin's additions. The book has the merit of including information concerning most of the modern resin solvents, such as monochlorobenzol, chlorhydrine, carbon tetrachloride, and terpineol, and describes the latest practices in varnish manufacture. It will interest all engaged in the varnish industry.

At the end of the book the translator has added an interesting chapter on the constitution and nature of paint. Mr. Sabin contends that tests for the durability of paint which are completed in one or two years are of little value, and points out that in 1906 the American Society for Testing Materials applied nineteen kinds of paint to a metal railroad bridge, and that after five years all but one or two were in excellent condition and had preserved the metal perfectly.

CORRESPONDENCE.

Kelling Hall, Norfolk.

SIR,—In the course of your remarks on the drawing of the above in the Academy, you say "* * * But the walls are treated with rough-cast or plaster with horizontal courses and perpendicular streaks of brick cropping through, the reason for which, structural or æsthetic, eludes us." I think that both the difficulties disappear when it is pointed out that the construction in question is neither rough-cast nor plaster, but merely the traditional local treatment of brick and flint. E. B. M.

LONDON COUNCILS.

Barnet.—Plans submitted by the Surveyor have been approved for making-up a portion of Normandy-avenue. Plans have been passed for alterations and additions at St. Mary's Church, East Barnet. Mr. E. T. Bolton has lodged plans for five shops in Alverstone-avenue.

Brentford.—The Guardians have accepted the tender of Messrs. Ernest Hawkins & Co., Ltd., 109, Victoria-street, Westminster, S.W., at 855*l.*, for the construction of subways at the Infirmary.

East Ham.—Sanction has been received from the Local Government Board to borrow 558*l.* for carrying out sewerage works in Langdon-crescent and Sussex-road. Plans have been passed for Mr. F. Hamlett for four houses in Cotswold-gardens, also for Mr. W. J. Cottell for fifteen houses in Shoebury-road. Mr. F. H. Buen has lodged plans for club buildings in High-street South; as has also Mr. F. Hamlett for a warehouse at the rear of No. 18, Barking-road.

Friern Barnet.—At the last meeting of the Council plans were passed for Mr. J. Samms for the erection of three houses in Petworth-road.

Fulham.—A plan prepared by the Borough Surveyor has been approved for making-up and paving part of Crab Tree-lane. The tender of Mr. C. J. Ell has been accepted, at 498*l.*, for sinking a 50-ft. tubbed well, 8 ft. in diameter, in connexion with the air-lift pumping plant at the public baths.

Holborn.—The Public Health Committee have decided to carry out alterations at the Public Mortuary in Goldsmith-street.

Hornsey.—At a special meeting of the Education Committee it was decided to invite Mr. G. E. T. Laurence, Buckingham street, Adelphi, W.C., to prepare the necessary plans for alterations at the North Harringay School, and for the erection of a temporary school at Muswell Hill. The following plans have been passed by the Borough Council:—Mr. T. Kington Smith, Tottenham, alterations and additions to "Southwood Lodge," Southwood-lane; Messrs. Senecal & Co., Hatton-garden, E.C., alterations and additions to No. 11, Victoria parade, Muswell Hill-road, Muswell Hill: Mr. E. A. Lewis, Muswell Hill, N., four houses, Springcroft-avenue and Southern-road, Muswell Hill; Messrs. John Amor & Sons, Highgate-hill, alterations and additions to No. 28, Muswell-rise. The following plans have been lodged:—Mr. Frank Foster, Duke-street, Adelphi, W.C., bakery, Tottenham-lane; Mr. W. L. Burr, Lombard-street, E.C., alterations and additions at London County and Westminster Bank, The Broadway, Crouch End; Mr. Francis Howkins, Golder's Green, five houses, High-street, Hornsey.

Lambeth.—The existing 12-in. pipe sewer in York-road is to be relaid for about 95 ft., at an estimated cost of 85*l.* A plan has been passed for Messrs. Stringer Brothers for the erection of six houses in Claverdale-road, Upper Tulse-hill. Mr. A. F. Briggs, on behalf of Messrs. Schweppes, Ltd., has lodged plans with the London County Council for the erection of a building on the site of Nos. 45-9, Vauxhall-walk.

Leyton.—The following plans have been passed:—Mr. W. H. Franklin, four houses, Essex road; Mr. A. Radcliffe, six houses, Essex-road; Mr. J. A. Hennah, five houses, etc., Farmer-road.

Poplar.—The tender of the Limmer Asphalte Paving Company has been accepted for paving Stebondale street and Cotall street with 3-in. "lithomac," at 5s. per yard, including four years' maintenance; as has also the tender of the Taroads Syndicate, Ltd., for paving part of Stainsby-road with 3-in. bituminous macadam, at 3s. 6d. per yard, including three years' maintenance. The sewer in Guildford-road is to be reconstructed in 9-in. pipes at an estimated cost of 75*l.*

St. Pancras.—Electricity mains are to be extended in various roads at an estimated cost of 155*l.*

Southwark.—A letter has been received by the Borough Council from Mr. M. W. Matts, architect, Birkbeck Bank-chambers, Holborn, W.C., stating that in the event of his clients building upon the site of Stave Wharf, London Bridge, it would be necessary to apply to the London County Council, and that should that authority insist upon the building line being set back, would the Borough Council grant permission to build over Primrose-alley, in which case the owners of the land at the north-west corner might be induced to set back their premises. Mr. Matts is to be informed that no objection will be raised to his scheme, subject to certain conditions.

Watford (Rural).—The tender of Mr. G. R. Mann, Edgware, has been accepted at 740*l.* for making-up Shire-lane, Chorleywood.

West Ham.—Plans have been passed for Mr. J. Fossey for the erection of a bakery at the rear of Bristol-road, Stratford; also for Mr. M. W. Hudson for alterations to factory, Maitland-road, Stratford.

Woolwich.—Tenders are to be invited for the erection of a combined convenience and tramway shelter at the rear of Eltham Cottages, Abbey Wood-road, at an estimated cost of 270*l.* Electricity mains are to be extended at an estimated cost of 115*l.* Plans have been lodged with the London County Council by Messrs. Arundell & Sons, 49, New Cross-road, S.E., for the erection of a cinematograph theatre upon the site of Nos. 93-5, New-road. The following plans have been passed:—Messrs. Burton & de Bertodano, 5, Bloomsbury-square, W.C., drill hall and headquarters, Charles-street, Plumstead, for the County of London Territorial Force Association; Mr. G. B. Dale, 15, Ladysmith-road, Eltham, five houses, Footscray-road, Eltham; Mr. E. H. Kemp, 1A, Eleanor-road, Woolwich, warehouse, Spray-street, Plumstead; Mr. G. T. Arnold, 147, Powis-street, Woolwich, thirty-eight houses, Rochdale-road, Plumstead, for the Royal Arsenal Co-operative Society, Ltd.; Mr. C. H. Jordan, "Luanza," 39, West Mount-road, Eltham; Baptist chapel, etc., Elibank-road, Eltham.

In reference to the paragraph on page 557 of our issue of the 10th inst., relating to the results of tendering for asphalt paving-work under the St. Marylebone Borough Council, we are asked to state that the work in Church and North streets consists of the excavation and removal of the existing macadam road-way, the supplying and laying of a new Portland cement concrete foundation, and 2-in. compressed natural rock asphalt, whereas the work in Bird-street is to take up the existing asphalt paving, make good any defects in the concrete foundation, and lay compressed natural rock asphalt 2 in. in thickness thereon.

EDITORIAL SUMMARY.

"A Piccadilly Blunder" is the title of the leading article.

Our second article is entitled "Regis ratio and Personal Qualifications" (p. 566).

An article on "The Royal Academy Exhibition" (p. 566) deals with ecclesiastical work.

In "Notes" columns (p. 567) will be found observations on: "Southwark and St. Paul's Bridges"; "Civic Amenities"; "The London County Council Hall"; "The London University Site"; "Another Suggested Site."

An article on "Renaissance Sculpture at the Burlington Fine Arts Club" is given on p. 568.

An article on "Architecture at the Royal Scottish Academy, 1912," appears on p. 568.

Architectural Societies (p. 571) include short notices of: "The Society of Architects"; "Northern Architectural Association"; "Edinburgh Architectural Association."

Book notices (p. 574) include: "The Construction of Lombard and Gothic Vaults": "German Varnish-Making."

The Monthly Illustrated Historical Review (p. 577) contains: "The Architecture of Portugal"; "The History of the Ouse Bridge, York"; "The Impending Demolition of the Rooms of the Birmingham Royal Society of Artists"; and Notes.

The Building Trade Section (p. 582) includes: "The Land Duties"; "The Mediæval Joiner"; "The British Engineers' Association"; "Projected New Buildings in the Provinces," etc.

In Law Reports (p. 585) will be found: "Griffith *v.* Richard Clay & Sons, Ltd." —Blackfriars ancient light dispute; "Tottenham Urban District Council *v.* Rowley"—right of way case; "Bromley *v.* Freeman & Co."—Building Act case.

In "Legal Column" (p. 585) are notes on: "Landlord and Tenant"; "The Trade Disputes Act"; "Land Valuation"; "Boundaries to Land."

MEETINGS.

FRIDAY, MAY 17.

Junior Institution of Engineers.—(1) Visit to the works of the Orchestrelle Company at Hayes. 3 p.m. (2) At 39, Victoria-street, Westminster. Mr. G. C. Allingham on "Storage Battery Engineering." 8 p.m.

The Garden Cities and Town Planning Association (3, Gray's Inn-place, W.C.).—Mr. Raymond Unwin on "Garden Cities and Garden Suburbs" 5 p.m.

SATURDAY, MAY 18.

Edinburgh Architectural Association.—Visit to Raith, Kirkcaldy.

Guild of Architects' Assistants.—Visit to Wesleyan Centenary Hall, Westminster, S.W. 3 p.m.

MONDAY, MAY 20.

The Royal Institute of British Architects.—Mr. R. A. Cram on "Recent University Architecture in the United States." 8.30 p.m.

Quantity Surveyors' Association.—Annual dinner, Connaught Rooms, Great Queen-street, Kingsway, W.C. 6.30 p.m.

Royal Society of Arts (Howard Lecture).—Capt. H. R. Sankey, R.E., on "Heavy Oil Engines"—V. 8 p.m.

TUESDAY, MAY 21.

Royal Society of Arts (Colonial Section).—The Hon. J. G. Jenkins on "Australian Railways." 4.30 p.m.

WEDNESDAY, MAY 22.

Institution of Municipal Engineers (Council Chamber, 4, Southampton-row, W.C.).—Discussion on "Water Softening." 7.30 p.m.

THURSDAY, MAY 23.

Society of Antiquaries. 8.30 p.m.

Junior Institution of Engineers.—Visit to the General Post Office Avenue Telephone Exchange, at 22, Cresechurch-lane, E.C. 6 p.m.

Incorporated Church Building Society.—The annual general Court, to be held in the Church House, Dean's-yard, Westminster. The chair will be taken by the Lord Bishop of Chester. 3 p.m.

The London Society (at the Galleries of the Royal Society of British Artists, Suffolk-street, Pall-mall East).—Mr. T. Raffles Davison on "London as It Is and as It Might Be," representing the views of the Committee on the future work of the Society. With lantern illustrations. The Right Hon. the Earl of Plymouth, C.B., will preside. 7.45 p.m.

FRIDAY, MAY 24.

The Royal Sanitary Institute.—Provincial sessional meeting, Blackpool, in the Council Chamber, Town Hall, when discussions will take place on (1) "The Card Index System as Applied to Public Health Work," to be opened by Mr. E. W. Rees Jones, M.D., D.P.H. (Medical Officer of Health, Blackpool), and "A Description of the Joint Scheme of Sewerage for Thornton-le-Fylde, Bispham-with-Norbreck and Carleton," to be opened by Mr. Arthur Hindle, M.Inst.C.E. The chair will be taken at 7.30 p.m. by Colonel J. Lane Notter, R.A.M.C., M.A., M.D.

Junior Institution of Engineers (at the rooms of the Institution, 39, Victoria-street, S.W.).—Mr. S. H. Hole on "Brewery Plant."

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

LOANS.—The Finance Committee recommended and it was agreed that loans should be made to Borough Councils as follows:—Fulham, 3,200*l.* for electricity undertaking; Hackney, 2,630*l.* for street improvements; Kensington, 5,745*l.* towards street improvement; and Stepney, 4,500*l.* for electricity mains.

LONDON COUNTY HALL. In the annual estimates for 1912–13 it was proposed to spend 72,150*l.* upon the building and embankment wall of the new County Hall. A discussion was raised by Mr. J. D. Gilbert, who proposed an amendment for a supplementary vote in order to expedite the work.

Mr. Edward Smith said that when a recent visit to the site was made by a deputation only sixty-two men were at work. This delay was costly, for the London County Council was now housed in thirty-seven different buildings at a rental of 1,000*l.* per week.

Mr. F. L. Dove said that the contractors were not to blame, as they were ahead of their contract time, and the drawings for the superstructure had not yet been passed. The building could be finished before 1916 if the Council, in advertising for tenders for the erection of the superstructure, offered a premium for earlier completion.

Sir Edward White said that when he recently visited the site only thirteen bricklayers were employed, and as a matter of fact there was work for 300 for some months to come.

Mr. I. Salmon stated that the whole of the substructure would be finished in fifteen months' time and a start made with the superstructure, which should be completed in three years.

Mr. Gilbert's amendment was rejected, but the Council requested the Establishment Committee to report on the action it was taking with a view to expedite the work.

THEATRES, ETC.—The following drawings have been passed by the Theatres and Music Halls Committee:—Cinema House, 225, Oxford-street—ventilation of restaurant in basement; Imperial Hotel, Russell-square—automatic opening doors; 134, Streatham High-road (Streatham Picture Theatre)—arrangement of proscenium; Broadway Theatre, Deptford—alterations to lighting arrangements; Eltham Parish Hall, Wellington-road, Eltham—alteration in position of doors from the stage; Empress Theatre of Varieties, Brixton—alterations to electrical installation; Piccadilly Hotel, Piccadilly—provision of a draught screen between the grill-room and cloak-room; Queen's Theatre, Shaftesbury-avenue—provision of a screen in the dress circle; Yiddish Theatre, Commercial-road—formation of doorway between the prompt side of the stall and the dressing-room corridor.

CINEMATOGRAPH HALLS, ETC.—Drawings have also been received for a cinematograph hall proposed to be erected in Brixton-hill, adjoining the Lambeth Town Hall, and also at the junction of Marylebone-road and Edgware-road, and for alterations to the College Park Picture Theatre, Trenmar-gardens, Harrow-road.

ILLUSTRATIONS.

Royal Academy Exhibition.

IN our illustrations this week are the two works shown at the Royal Academy by Sir Ernest George and Mr. A. B. Yeates. These are both water-colour drawings by Sir Ernest George.

One of them, "Woodside," is a house to be built for Mr. A. H. Moreing at Esher. An avenue and forecourt form the approach to the house, not seen in this drawing.

The wise but unusual course has been taken of preparing to receive the house, a high walled garden with its gates, paved paths, and green walks, with the planting being already completed, as also the terracing, road-making, garage, and cottages, so that the house will rise in comely surroundings.

The house provides a large hall in which the billiard table has its own recess. An open loggia is at one end of the hall, while another of apsidal form is against the south wall of the drawing-room.

The materials are grey-brown Sussex bricks with Portland stone dressings, the roofs being stone slated.

The "wood-frame" house, British Guiana, for Messrs. Davson, is built on local methods. Brick piers, or arcades raise it above the rather swampy soil.

The large rooms have wide balconies round them and windows on both sides. The wood framing is of teak, and the weather-boarding of the local mahogany, although it is the custom to paint the latter.

The Ouse Bridge, York.

OUR third plate represents the conjectural appearance of the Ouse Bridge at various periods. The history of the bridge is referred to in the article on page 579.

FIFTY YEARS AGO.

From the *Builder* of May 17, 1862.

The International Exhibition.

WHY were the French so behindhand at last? Here is a Frenchman's explanation. I fell in with him yesterday morning on my road to Brompton—a stout, bustling, burly, little gentleman, who, after inquiring his way, introduced himself as an *exposant*. He admitted, however, that he had hitherto exhibited nothing, and had, at present, nothing to exhibit, stating, at the same time, that he was far in advance of a multitude of other *exposants*—and, with true Parisian volubility, going on to inform me that the fact of his being now before so many others arose from his having been a fortnight or three weeks behind them in sending off his merchandise! At this point of his narration he abruptly ceased, and, wheeling suddenly in front of me, so as to prevent any further progress, forced from me an immediate demand for an explanation of the seeming paradox. "*Voyez vous, monsieur,*" he recommenced, "*Je vais vous donner le mot de l'enigme.*" Some time ago the French were more forward than the English, as you know—their goods were arriving by shiploads at several English ports so fast, and the completion of the building was so slow, that orders were sent down to all ports where French goods were arriving, directing that the cases should be stowed away in the local Custom Houses and not sent on to London till the building was more nearly ready to receive them. In this way the piles of enormous packing-cases rose rapidly in mighty masses, up to the very rafters of the warehouses, insomuch, said my loquacious friend, that those cases which arrived *last*, had to be given out *first*; while the first arrived, which lay buried at the bottom of the vast pile, had to await the slow removal of the whole of the upper strata.

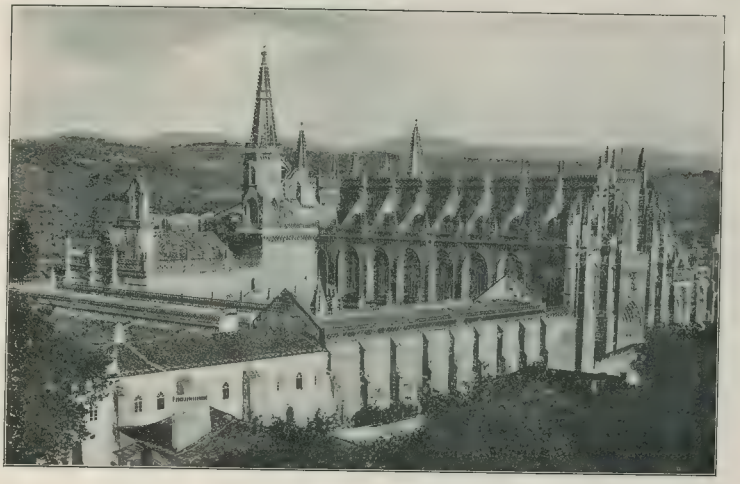

Fig. 1. Abbey of Batalha, Portugal, from the North-West.

THE ARCHITECTURE OF PORTUGAL.—III.

(*Continued from page* 459.)

[HE most perfect specimen of Gothic art of the XIVth century which Portugal can boast is certainly the work of foreigners, probably Frenchmen. It sts of the tombs of Dom Pedro I. and Inez astro, whose tragic story has been the of countless romances and ballads. ffigies of the royal lovers face one another vaulted chapel at Alcobaça. They lie, ed by angels, on tall sarcophagi, decorated the sides with canopy work of indescrib- richness and sculpture of consummate plishment, both of which are unparalleled rtugal at that period. The architectural nent, though extremely intricate and cising some favourite Portuguese motives, oid of the luscious barbarism of the late style and instinct with the austere of Northern art. Their date is about

period under consideration also produced interesting military architecture, as illus-, for instance, in the extraordinarily esque ruined castle of Leiria perched the little town on the top of an almost ssible rock. Its donjon, which is at the t point, was built in 1324 by King Denis abourer, and the rest of the structure, comprises the Great Hall, with pointed and windows, and the chapel already nned, may be a little later. A better ved example of the work of the same tigable royal builder is the castle of whose mighty octagonal keep has a top story with great corbelled balconies angles.

he death of Dom Pedro's son Ferdinand in he Burgundian line was left without a ate male representative, and, in order id absorption into Castile by the marriage daughter, Doña Brites, the Cortes elected gitimate son of Dom Pedro to fill the . John I. thus became the founder of a nasty, that of the House of Aviz, under rule Portugal reached the apogee of and power. The new reign was inau- d by the decisive battle of Aljubarrota, ch the Castilians were defeated and the ndence of Portugal was secured. Dom shortly afterwards strengthened his n by a treaty with Edward III. of d and his marriage with Philippa, er of John of Gaunt and Blanche of ter. Later in the reign the foundations of a world-wide colonial empire were laid under the influence of their second son, Prince Henry the Navigator, and the hereditary war against the Moors was carried into their own country across the water. The most brilliant period in Portuguese architecture coincides with that of the national fortunes. It opens with the erection of one of the most remarkable churches in Europe, Sta Maria da Vittoria, in a hollow among the hills, where the fighting began which ended in the Spanish rout at Aljubarrota, since known as Batalha. This Battle Abbey (Fig. 1), a great collegiate church with extensive dependencies, built of white limestone mellowing to gold, gleams out among the dark pine woods, the groves of cork oak and the olive yards that dot the dark red soil of the rounded hills. It was founded in 1387 and finished, at least as regards the church proper, at Queen Philippa's death in 1415, while the Founder's Chapel, begun later than the church, was finished about fifteen years later.

The scheme includes a church with a mausoleum chapel on the south, and cloisters surrounded by monastic buildings on the north (Fig. 2). The church is planned in native fashion with aisled nave (of eight bays), a transept projecting beyond the aisles, one bay each way and five eastern chapels. Four of these consist each of a rectangular compartment and a three-sided apse, while the central one, which is the width of the nave, has two rectangular compartments and a five-sided apse. The plan is so consonant with Portuguese usage that no further disproof is needed of the tradition that Queen Philippa obtained it ready-made from England. Neither does the old story of an English architect named Stephen Stephenson appear to rest on any solid foundation. It is probably the work of the first architect, Affonso Domingues, who appears to have carried up the work of the east end to a considerable height. The remainder was carried out under one Huet (Huguet or Ouguet), said to have been an Irishman, who succeeded him in 1402. A

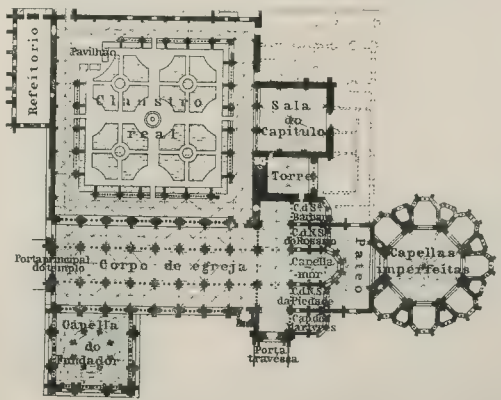

Fig. 2. Plan of the Abbey of Batalha.
(From *Baedeker's Guide.*)

Fig. 3. Abbey of Batalha: East End, and "Capellas Inperfeitas."

number of peculiarities certainly have an English look, though the resemblance in some cases may be accidental, but others suggest French and even German influence, while others again are probably traceable ultimately to Moorish influence. The church, in fact, is a most puzzling problem, which anyone armed only with an acquaintance with Northern Gothic and unaware of the date of construction would be hopelessly at sea in attempting to unravel.

The eastern apses (Fig. 3) have tall buttresses with an unusual number of offsets and tall single lancet lights which, in the higher central chapel, are in two tiers. This is in accordance with Portuguese usage. But there is much in the general appearance of the remainder of the church which gives colour to its alleged English origin. It resembles a Perpendicular church or college chapel in its long lines of flat roof with pierced balustrades and pinnacles, in its ranges of large traceried windows, in the design of the nave and south transept fronts with their large single clearstory windows; while the great doorways below them have in each case a good deal of English-looking late Decorated or early Perpendicular detail and carving, especially in their crockets and pinnacles. The south doorway itself is, it is true, of a Portuguese type, a curious throwback to the work of a hundred years earlier, such as may be seen at Santarem, surmounted by a great heraldic panel, so characteristic of Iberian practice, but the west doorway recalls nothing so much as the same feature at King's College Chapel at Cambridge. The flat roofs are, of course, not necessarily of English origin, but the natural outcome of the native system of paved terrace coverings and the reticulated tracery of the aisle and the clearstory windows is not peculiarly English, while that of the great west window, with its flowing geometrical pattern filling the entire opening, is obviously a native attempt to adapt a northern feature for the purpose of excluding the excess of light, which might have been more easily effected by using smaller openings. Internally the design of the nave (Fig. 4), with its exceedingly lofty arcade and absence of triforium, is of an English type; while the vaulting betrays mixed influence, its great height (106 ft. with a width of only 25 ft.) is French, the presence of a ridge rib English, and the pronounced character of the transverse ribs seems copied from Alcobaça. Again the square abaci and bases are another curious throwback to very early usage.

The Capella do Fundador projecting to the south of the three western bays of the nave is planned as a square with a central octagonal lantern carried on light piers. The tracery of its windows, which is rather better managed than elsewhere, is of a flowing, almost Flamboyant, type, not distinctively either English or French, while the piers, composed of a number of cylindrical shafts with fine leaf capitals and octagonal abaci, might pass for English; not so, however, the stilted arches which they support, and which are fringed with elaborate cusping. This is a feature which occurs elsewhere in the church, and is, indeed, a characteristic one throughout the peninsula, and probably a relic of Moorish taste. The altar of the tomb of the king and queen in the centre and those of their four younger sons in niches along the south wall, though enriched with heraldry and other devices, are plain compared with those at Alcobaça, nor is their sculpture as fine. The cloisters in their original condition were relatively sober and very dignified, and might be classed as Geometrical Decorated, though minor differences from northern work, as, for instance, in the section of the ribs, are not lacking. Another feature of the exterior, which, if not of native invention, would suggest German influence, is the open work spire attached to the north transept, and another said to have stood over the Founder's Chapel before the Great Earthquake.

The explanation of the anomalies met with at Batalha appears to be that the work was carried out largely by Portuguese, who h a fairly free hand as to particular features a details, under the superintendence of a man wh whether himself English or not, was we acquainted with English work, and either ha travelled in France or was assisted by a certa number of Frenchmen. The effect which t splendid abbey produces is as mixed as i origin. Externally the proportions are i posing, and the elevations marked in parts considerable beauty of feature and detail, b the effect is marred, as so often in Portugal, a florid treatment, involving the use of assorted and ill-digested foreign elements.

The disagreeable effect is greatly enhanc by excessive restoration and the mechanical multiplied embellishments which have be showered on the building with an unsparin hand, while the colour of the stone, particular when new, is not altogether agreeable. Inte nally the church is far more successful. Indee few nobler or more impressive interiors th that of Batalha, swept though it is of splendid fittings through the vandalism of t French in 1810, are to be found in the wh of Europe. One of the most remarkab features in its construction is the sudde appearance, without any intermediate ste of a system of vaulting which is bold, not mere in comparison with the timidity of Alcoba but even with northern examples. Not on are the high vaults of unusual loftiness, but t chapter house, which as usual in Portugal quite open to the cloisters, is the largest know room vaulted in one span without centr support, and, what is more, this vault is strongly built that it has stood repeated eart quakes. It is a square of over 60 ft. reduc to an octagon by arches thrown across t angles.

Huet's successes were not at an end on t completion of the Founder's Chapel, for Ki John's eldest son, Dom Duarte, or Edwar so named after his great-grandfathe Edward III. of England, decided to bui himself a yet more magnificent mausoleum, b his reign was brief and unsuccessful, and remains unfinished to this day.

The Capellas Imperfeitas, as they are calle stand to the east of the choir in the axis of t church. The plan is a very beautiful on and would if isolated have consisted of eig

Fig. 4. Abbey of Batalha: Nave, looking East.

psidal chapels radiating from an octagonal hamber and eight smaller pentagonal chapels the angles intervening between them; but vaulted hall which connects the mausoleum ith the choir occupies the space of one of the sidal and two of the pentagonal chapels. ie external treatment resembles that of e choir, many times weathered buttresses ternating with tall and narrow-pointed ndows, but the latter have two lights with acery in the head and under the transom, nich divides them at mid height. The central ult was not carried out. In the succeeding gns a second and almost aridly simple ister was added beyond the first.

The Cathedral of Braga, begun like Batalha King John I., has many points in common th it both as regards plan and elevations. ut it has western towers with the peculiarity at they are set anglewise and become tagonal at a higher level. Unlike Batalha, has preserved much of its elaborate furniture.

THE HISTORY OF THE OUSE BRIDGE, YORK.*

Prior to the advent of the Romans to York e settlement of the Brigantes was most obably confined to the western side of the ver Ouse, and the principal need for the tification of the Romans lay to the east of river, around the Palace of the Emperors, ile the one-time Brigantine colony gave place the villas and cemetery of the Roman stocracy. Hence the need for the first dge, the character and dimensions of which are lost in antiquity. The site was some 300 yds. the north of the present Ouse Bridge.

The importance of the site of the existing dge was recognised before the Conquest, the position was occupied by a bridge of od that came to so untimely an end when chbishop William Fitzherbert entered the y. The people thronged to meet him, thering in great crowds along the route, d especially on the bridge. The weight oved too great for the feeble structure, and people were precipitated into the river. is said that the prelate, by making the sign the cross over the struggling mass, invoked ine intervention and saved the crowd from wning. Attributing their preservation to supernatural, they regarded him as a at and erected a chapel dedicated to him the succeeding structure.

The River Stratford was the first to be spanned a bridge entirely of stone, in the reign of nry I. about 1118, and it was not until e eighty years after the partial destruction the bridge at York that it was replaced a more substantial structure of stone. reasing commerce led to a desire for a more modious erection, and in 1235 Archbishop ter de Grey issued a command for the nstruction of the bridge in stone.

Remembering that Archbishop Grey built transepts of the Cathedral at York and Church of All Saints at Skelton, beautiful mples of Early English Gothic, it is not a ter for marvel that the new bridge con- d of six Gothic arches. Compared with bridges of the present, it was very narrow on both sides of the roadway were business, rial, and legal buildings, which were, it is , built at the same time as the bridge, gh this is conjectural.

o keep the bridge in repair a licence was nted to the Mayor by Edward II. early in XIVth century "to make such purchases would produce one hundred pounds a year, h product was to be applied to support bridges of the Ouse and Foss." It is ved that this led to the erection of the ses on the bridge, and that the increment would accrue therefrom was used for purposes of reparation. The probability of is heightened by the fact that the whole ne property on the bridge was owned by Corporation.

he bridge in the time of the Edwards con- ed buildings fulfilling the uses of the later Guildhall. The City Courts were there, ther with the offices of the officials. In many Superior Courts were moved from don to York, and were held on the bridge. ous local courts had their home here, ding those of the County, Sheriff, Con- ancy, Coroner, and Chamberlains. Rooms ed for purposes other than judicial were e found on the bridge. The "Guild of per Surgeons" met here and was formed of

* See Plate.

Conjectural Restoration of Ouse Bridge, York: Doorway, with Window over, to St. William's Chapel. Details as in 1560.

From a Drawing by Mr. D. Morrell.

those who practised medicine and shaving—a significant combination.

The principal building on the bridge was the chapel, the origin of which is somewhat obscure. Some say it was a memorial to Archbishop William Fitzherbert, while others adhere to the story of the Scotch nobleman whose servants quarrelled with some of the citizens, causing a riot, in which many were killed. The dispute for damages resulted in an appeal to Royalty, which was decided in favour of the nobleman's servants, the citizens agreeing to pay the sum of three hundred pounds for the erection of a chapel and the maintenance of two priests therein.

Little now remains of the chapel but the valuable drawings of Halfpenny and Cave, and fragments of the ornament to be found in the Hospitium of the Abbey of St. Mary's at York. Cave says of the chapel that "one part is of enriched Saxon architecture; the other simply Gothic. . . .; and it is not improbable that the chapel existed at the time of the quarrel, and that the east end was an addition."

The doorway to the chapel was an example of remarkably fine Norman work. It was considerably enriched, yet bore little resemblance to any of the several Norman doorways extant in York and district, and it is interesting to observe the absence of the signs of the Zodiac so frequently used by the Norman builders. The Order, usually enriched by the astrological signs, in this instance bore a peculiar interlacing ornament resembling a chain (see drawing).

A portion of the interior walls was arcaded with a series of flat arches of enriched chevron, a complete bay of which is still preserved in the Museum at York. The east end had a beautifully proportioned three-light window of the Transitional period, while it is conjectured that the windows to the roadway were inserted in the XVth century.

At the Reformation it ceased to be a place of religious worship and became the busy exchange of the city merchants; then in 1555, by grant of the Lord Mayor, a school, subsequently abandoned through lack of scholars; and in its last days fulfilled the purpose of a fire-station.

Beneath the Chapel of St. William was the city prison, known as the "kidcote," and lunatics as well as felons were detained in the cells that overlooked the river and were subject to flood, doubtless rendering them as wretched as any prison of that day.

It is assumed that, owing to the narrowness of the bridge, the houses hung over the river to a considerable extent, and were also carried over the footpath, the upper stories being supported upon posts at intervals; an example of this is still to be seen in the street leading to the bridge. The bridge, with its houses of quaint overhanging stories and gables, must

at this period have presented a most picturesque appearance.

In 1564 a disastrous flood occurred, carrying away the two central arches of the bridge and several houses, thereby causing considerable loss of life. For some two years the bridge remained in a ruinous condition, causing great inconvenience. Vehicular traffic was perforce suspended, but temporary accommodation was made for pedestrians. It was ultimately restored by public subscription, one large central arch taking the place of the two destroyed by the flood. Of this arch it was said that it had the greatest span in existence at the time.

About the middle of the XVIIIth century the property on the bridge was condemned and ordered to be removed, and a parapet and railings took the place of the demolished houses. The end of the century saw further improvements. Coaches now demanded a wider road, and the removal of more houses materially improved both the appearance and utility of the bridge.

The Corporation at this time were concerned with the replacing of the structure, as the bridge, notwithstanding the many improvements, was inadequate to cope with the increasing demands placed upon it. Atkinson, the City Steward, was called upon to draw up plans and estimates, which ultimately resulted in the present bridge. It was recommended that the new bridge should consist of one principal arch of iron, but luckily this project was abandoned.

During the first decade of the XIXth century an Act was obtained from Parliament to proceed with the new bridge, which was to have three elliptical arches, the central arch to have a span of 75 ft., and the side arches 63 ft. 6 in. respectively, and the breadth to be 45 ft. on soffit. The new erection was built in two halves, the old bridge being used during the construction of the first portion, which was completed in 1817, and the other half three years later. The widening of the approaches to the bridge was quickly effected, and a toll was demanded to defray expenses, which was levied until 1829.

Of this bridge one cannot but say that it is an admirable example of modern architecture, at once fulfilling the great essentials recently propounded by Professor R. Blomfield, who wrote that "utility and beauty must be the keynote of all good architecture."

THE IMPENDING DEMOLITION OF THE ROOMS OF THE BIRMINGHAM ROYAL SOCIETY OF ARTISTS.

By WILMOT CORFIELD.

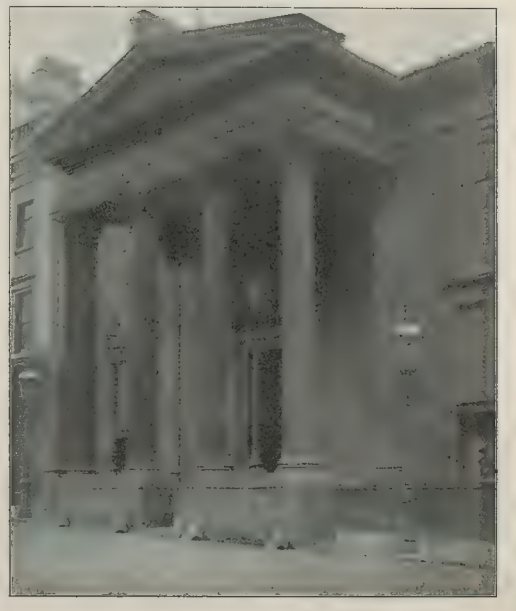
WHILE Manchester is reconciling herself to the loss of a fine Town Hall of earlier days Birmingham is faced with a lesser though similar difficulty. The changes and chances of inexorable time are about to deprive the Midland capital of one of its best known architectural landmarks; the building of the Society of Artists in New-street is marked for early destruction, and with its disappearance will be snapped a link with the pre-Victorian past as irreplaceable as it will be unforgettable.

It was only a few years ago that Christ Church was demolished after standing for about a century at the highest point of New-street, architecturally the culminating crown of an attractive thoroughfare, which even yet the business spirit of modern commercialism has failed to spoil. Ponderous, imposingly ugly, and with a Doric portico characteristic of the Georgian era's sombre taste in the matter of church design, it none the less dominated New-street, its strength and simplicity of outline providing just that touch of distinction without which no leading street of a great town is omplete. One of its catacombs was interesting as the resting-place of John Baskerville, the eminent printer of eccentric political views.

On the north side of New-street going west, a little short of the site of the lost church, and just where a gentle rise in the ground leads up to the stately Town Hall (one of the architects of which was Hansom, who invented a cab), is the classic portico of the Artists upon which sentence has been pronounced. It is a few years older than the hall, to which it bears much the same architectural and topographical relationship that Wren's St. Martin's on Ludgate-hill bears to St. Paul's Cathedral. A new building will arise equipped with XXth-century architectural points plus financial shop-letting certainties, but there will be no portico to obstruct the passageway, no columned foil to the columned hall beyond.

Birmingham as a community first seriously devoted itself to fine art in or about 1807; in that year or a little later Samuel Lines set up a "drawing academy" in Temple-row West, a street bordering on a district of Pickwickian traditions. The Barbers, father and son, were among his pupils, and they, in their turn starting another academic venture, had among their pupils F. H. Henshaw. Success, of a sort, spelt ambition, and ambition progress, and on September 12, 1814, the "Birmingham Academy of Arts," a society of artists and amateurs, opened the first public art exhibition on the town's records in or near Union-street. Among the honorary promoters of the movement were J. M W. Turner, Benjamin West, John Soane, John Flaxman, and Richard Westmacott, while the contributors included Charles Barber, Rowland Hill (afterwards the Postal Reformer, who sent in a picture of an Abbey), H. H. Lines, S. Lines, W. Radclyffe, and J. V. Barber (Hon. Secretary). No second exhibition was held, but these artistic pioneers, evidently encouraged by a semi-success, determined on the acquirement of a permanent building of their own, their appeal for pecuniary aid indulging "a confident expectation that the taste and liberality of the public would enable them to accomplish the full extent of their design." The response, however, apparently proved for some years disappointing, one literary lady celebrity of the period, whom the artists seem to have approached in 1814, writing: "I think the genius of Birmingham is more calculated to paint tea-boards than pictures," and, after predicting probable failure, suggesting that, in the event of the proposed building coming on the market, it might serve for "a Methodist meeting-house, that Society being flourishing enough to take possession of all cast-off public edifices whatsoever." The "people called Methodists" never got the chance, however, of snapping up an unconsidered trifle in the form of an unappreciated home of the arts, for it looks as though the scheme, like many other equally well-intentioned schemes, fell through, for the aspiring "Birmingham Academy of Arts" never actually materialised itself in the medium of bricks and mortar.

A local artistic hiatus followed. Possibly the unsettled political outlook of the closing years of George III. were as little conducive to the advancement of art in the provinces as of eve more pressing reforms in other directions, fo as everyone knows,



> "Art stopped short
> At the cultivated Court
> Of the Empress Josephine,"

until, with George IV. enthroned, the count was more in a mood for true artistic develo ment. So it came about that with the ye 1821 a fresh body of associated artists a townsmen, working on the foundations laid t the enthusiasm of devoted predecessors, esta lished the "Birmingham Society of Arts," t continuing nucleus of the Birmingham "Roy Society of Artists" of to-day, the rightful heir Birmingham's artistic ages now on the point consigning its central shrine to the pick a spade.

Casting about for a site for building, the ne pioneers of 1821 came upon a derelict circul erection in the rear of the then new church wit a frontage to New-street. It had previous housed "panoramas," and had also bee occupied by auctioneers. A still extan picturesque landscape painting of the perio by Samuel Lines, shows it as a prominent featu to the south-west of fields bounded by Ne street, Ann-street (Colmore-row), and the pr sent Temple-row West; Bennett's-hill (whe Burne-Jones was born) had not then been ma and Waterloo-street was also a thing of t future.

The present structure replaced the ricket receptacle of the departed panoramas in 182 the architects being Messrs. Rickman Hutchinson, and the cost about 4,000*l*. It of Bath stone, and externally of the Corinthia Order; the lines of the composition, though n lacking defects, are of monumental dignit adapted, though "not servilely copied," fro "one of the most chaste and exquisite remains of classic splendour, the Roman Temple Jupiter Statue. The shafts of the colum supporting the cornice are of noble proportion and it is interesting to note that one at least their capitals was carved by a young workma afterwards famous as J. H. Foley, R.A.

The grateful refuge afforded by the transitio from glare or rain to the protection of the kindl portico of subtle depths of shade is a luxur bustling Birmingham finds itself no longer ab to afford. The city is out for money, not fo sentiment; the way is narrowed where th pillars are, and the crowd a pressing crowd of th insistent kind. And so the soot-logged vene able portico, with all its ghosts of memorie must go, and lovers of the old order of Birmin ham things are desolated.

Portico of the Birmingham R.S.A. Building.

And yet the city is not without high ideals. his year of the opening of its new Art Gallery es also the destruction of Chantrey's and oley's portico; while in this same period of race Birmingham's supreme art treasures onspicuously adorn, with only too passing a rilliance, London's Gallery of British Art at illbank. A city of amorphous aim, not njustly considered symbolical of the Philistine man, Birmingham, with its musical festivals nd superb art collections, has set an example to ondon itself. And yet—and yet! But why oralise? Some clue may perhaps be found to ne solving of a perplexing problem in a speech y Mr. Whitworth Wallis, reported in the *Builder* March 8. Speaking of the new bridge span- ng Edmund-street and connecting the Art allery with its new extension, the official rector of the city's art proclivities is said to ave remarked that "personally he did not re at all what the bridge was outside so long it was beautiful within." Mr. Wallis may ve been wrongly reported. This public nunciation of his acceptance of a reversal of the eory associated with the "whited sepulchre" etaphor is unconsoling; but may not much at is repellent in the architecture of our great odern centres of industry be due to the too neral acquiescence in the idea that nothing chitecturally matters to the man in the street long as he stays there?

In a loss of this kind the mind lingers on the e of the passing pile. Those New-street lars are part and parcel of the youth of many Birmingham man, the doomed pediment and rnice his lifelong friends. What of the ure? Temple Bar, spirited away into ivacy, was dead to London before London oke to a sense of its loss. On the other nd, Crosby Hall, clipped and shorn, it is te, but still Crosby Hall, lives again at Chelsea; nile the main portico of the National Gallery s formerly a feature of old Carlton House. ere is no delicate filigree work about the rmingham portico. It is easily susceptible bodily transplantation. The Edmund-street ade of the reference library is a deplorable ort in masonry. At the time of its erection wise intention of continuing Barry's fine ign round the corner from Ratcliff-place was andoned, and an elevation by "another nd" approved. It is true that the Artists tico would not be quite in keeping with rry's work, but it would be something nitely better than the existing Edmund- eet architectural fiasco. It is known that dical developments in the internal con- uctional arrangements of the Midland titute and Corporation Library are in con- mplation. "The Commissioners of the eets" in 1829 gave special permission for projection of the condemned Artists portico oss the New-street footpath in the days when mingham men were seriously pondering the nging into being of their beautiful civic hall. give history an opportunity of repeating self, a similar act of grace on the part of the poration of Greater Birmingham in 1912 rying permission for an extension over the mund-street pavement for the purpose of nsferring the portico of the Royal Society of ists to become the entrance to the vestibule replanned library building would meet with e appreciation.

HISTORICAL NOTES.

Pierre Puget. In his paper read recently before the Royal Institute of British Architects (see our e of April 26) Mr. Townsend said, "This versal genius" (Pierre Puget) "during his in England designed Walpole House in omsbury on the site on which the British seum now stands." Professor Blomfield es to the *Journal* of the Institute as follows: he house on the site of which the British seum now stands was not Walpole House 'Montagu House,' which was rebuilt after re in 1678 by Louis XIV. for the French bassador, the Duc de Montagu, on condition the artists employed were Frenchmen. architect was a certain Pouget or Poughet. re is no foundation at all for the statement Puget, the sculptor, designed this house, ept a guess of Mariette's that Pouget and et might possibly be the same. But in 8 Puget was hard at work on his Milo and relief of Alexander and Diogenes, and there o authority for supposing that he was ever gland at all."

Records of Old Buildings. The Records Committee of the Royal Institute of British Architects are compiling a list of interesting houses and other buildings in London, particularly such as are likely to be pulled down. The Hon. Secretary of the Committee, Mr. W. Curtis Green, will be glad to hear of any threatened buildings of which records ought to be obtained before they are destroyed. Students who wish for subjects to measure may communicate with Mr. Rudolf Dircks, at 9, Conduit-street, W.

Historical Places, Twickenham. In response to an inquiry instituted by the Middlesex County Council, the Twickenham District Council have framed a schedule of "ancient monuments" in the parish which should be preserved. The list includes the houses of Turner and Tennyson; Saville House, for many years occupied by Lady Mary Wortley Montagu; the tombs of Pope and Kitty Clive; and Pope's Grotto. Of the last named an account was lately given in our columns at the time of the proposed sale of "Pope's Villa," the home of the late Mr. H. Labouchere, M.P., and built in 1809 by Sophia, Baroness Howe, eldest daughter of the famous Admiral, on the site of Pope's house. In Kensington Palace (London Museum) is a picture, with figures, of the grotto, ttributed to Hogarth.

West Horsley Church. The ancient Parish Church of West Horsley, Surrey, is in need of restoration, and an influential Committee has been formed; 400*l.* has already been promised locally. The central portion of the old structure has stood on the present site for upwards of ten centuries, and can claim association with royalty and nobility during the ages. The north aisle and chancel are Early English, the remainder of the building belonging to the Perpendicular period. The old tower, with its shingled spire, presents a picturesque appearance with the antique wooden porch projecting from it, overgrown with ivy.

Parish Church of Tunstall. During the recent restoration of the old parish church of Tunstall, near Kirkby Lonsdale, an inscribed slab of stone was found built into the rubble of the third light window in the north-east corner of the edifice. Mr. Moorhouse, of Kirkby Lonsdale, one of the contractors and an antiquarian himself, formed the opinion that the lettering was part of a Latin inscription. The relic was eventually submitted to Professor Haverfield, of Oxford, who described the stone as part of a Roman altar, and that the inscription on being translated read, "To the Holy God Asclepius and to Hygeia. Julius Saturninus set this Altar up." It is interesting to note that Asclepius and Hygeia were the God and Goddess of Health. Tunstall Church is not only famous for its antiquities, of which there are many, but it has also been immortalised by "George Eliot" in "Jane Eyre."

Priory Ruins at Colchester. At a recent vestry meeting for the parish of St. Botolph, Colchester, an interesting statement was made regarding the picturesque old priory ruins. The Rector, the Rev. W. E. Spencer, said that he had approached the Charity Commissioners with a view to having the property put in better order. An inspector of ancient buildings had been down and had gone carefully over the ruins, with the result that he said he was prepared to recommend the Government to repair the priory at the public cost.

Croxden Abbey. We referred last week (p. 545) to Mr. Charles Lynam's interesting work on St. Mary's Abbey, Croxden. The church is a plain structure, a circumstance in keeping with an order that made altar crosses of wood, and used but iron for candlesticks. The nave is long, the transept short, while the choir consists of one bay only, culminating in an apse surrounded by five circular chapels. The Cistercians were wont to divide their side chapels by solid walls rather than by screens, and the excavations clearly indicate a solid wall having existed between the chapels of the north transept as well as between those round the apse.

Port of London Authority: Site of New Offices. An unusually extensive clearance will shortly be made for the offices of the Port of London Authority. With the exception of the General Steam Navigation Company's premises, designed by Mr. E. B. I'Anson, in Great Tower-street, and Mark-lane Railway-station, there will be pulled down more than sixty houses in the area on the west side of Samuel Wyatt's Trinity House and Trinity-square. Nearly 1,000 tenants will be dispossessed, and the cost of acquiring the properties is estimated to be little less than one million sterling. The space to be cleared lies just within the line of the (second) Wall of London and next south to Fenchurch-street Railway-station. It covers the site (in the north-west corner) of the Navy Office of Pepys's and the Earl of Sandwich's time, and of the religious house dedicated to the Holy Cross of the Crutched or Crouched Friars, who were established there in the close of the XIIIth century. The Friars' Hall was converted, 1557, into a glass factory—one of the earliest in England—and consumed by fire twenty years afterwards. Of the old Navy Office, which was sold for 11,500*l.* in 1788, a vestige has remained to our day, the gateway forming the entrance to the London and India Docks warehouse.

Ancient Remains at Charing Cross. Amongst the objects that have been found in course of the excavations for joining the District and the Hampstead Railways are a stag's horn and a huge oak-tree, in the sand at a depth of 40 ft. below the surface. The tree, more than 2 ft. in diameter, is black with age, but the wood has retained its texture and solidity. The trunk had to be sawn from the roots and base before the mass could be lifted to the mouth of the shaft. It is conjectured that the tree—it is perhaps a relic of the great oak forest that skirted the lagoons of the Thames on the north—was undermined and carried away by flood and then deposited on a sandbank, which afterwards became covered with silt and alluvial soil. Thirty years ago, during the rebuilding of Messrs. Drummond's bank at Charing Cross, were discovered, in the recent deposits, bones of the horse, sheep, and the Celtic short-horned ox (*Bos longifrons*); and in the lower pleistocene gravels remains of rhinoceros, extinct ox (*Bos primigenius*), and red and fallow deer (*Cervus Brownii*), Irish deer (*Cervus megaceros*), tusks and bones of the elephant (*Elephas antiquus* and *Elephas primigenius*) and mammoth, and bones of the cave lion (*Felis leo spelæa*). Vestiges of the forest and of water beaches have been found along the confines of Regent's Park between York and Clarence Gates.

Restoration of Astley Church, Nuneaton. Considerable interest attaches to the restoration of this ancient structure, for it has been immortalised in the writings of "George Eliot," besides standing adjacent to the moated manor-house of Astley Castle, a circumstance giving it a close connexion with the history of England. Dedicated to St. Mary the Virgin, the church comprises a lofty nave and embattled western tower with eight pinnacles, and is a good specimen of the Decorated style of architecture, although now deprived of half its original extent. Formerly it was a cruciform building with several chapels, and a lofty spire which was so conspicuous from a distance as to earn for itself the title of "The Lantern of Arden." The present building is a plain square block with heavy crenellated parapet along the top, and with heavy mullioned windows. It dates from the time of Queen Mary.

Archæological Discovery in Corfu. Early in May in the garden of King George's villa, "Mon Repos," Corfu, the foundations and a considerable portion of the superstructure of an ancient temple were brought to light, writes a correspondent to the *Times*. Some few remains were discovered there in 1822, but the greater part of the structure has now been laid bare. The temple, which is of small dimensions, dates from the Vth or VIth century B.C. It is of the Doric Order, without triglyphs, and presents certain features of the Ionic style.

THE BUILDING TRADE.

THE LAND DUTIES.

THE recent debate on the land duties has once again drawn public attention to what is a serious clog on certain industries. It is important to note that, in answer to a question in Parliament, the net amounts raised from increment value duty and undeveloped land duty since they came into operation down to March 31 last have been elicited. Increment value duty has produced 6,251*l.*, and undeveloped land duty 31,293*l.* The valuation in the same period has cost the Government 688,000*l.*, and, although appended to the answer was a statement that the cost of valuation was a capital and non-recurring charge, and that the indirect effect of the valuation had been to increase the amounts received in death duties, it can no longer be denied that neither of the above taxes has accomplished what the Chancellor of the Exchequer, in introducing the Finance Act, 1909-10, claimed for them; whilst it must be admitted that their imposition has depreciated the value of land and buildings to a very serious extent, and that far from encouraging building, as the Chancellor stated they would do, they have seriously hindered activity in building enterprise.

The chief point made in the recent debate was that the increment duty, in violation of a pledge given by the Government, was being levied on occasional profits and on the value of buildings instead of being confined to an additional value accruing on the land. No one who remembers the debates on the Act when a Bill, and in especial Mr. Lloyd George's exposition of his Budget, can doubt that the impression given was that the increased value of land, which it was stated was created by the community, was to be the sole subject of taxation for the community. How little this limitation has been observed in practice is apparent from those cases which have received publicity; the value placed upon property as a purely hypothetical value—the value of the land as apart from the buildings upon it, and its natural amenities—can never be fairly ascertained for the purposes of taxation. The very fact that minus values have been given is sufficient to condemn the principle from a practical point of view, and no satisfactory assurance was obtained from the Government. Indeed, Mr. Masterman, who spoke for the Government, besides failing to show that the value of buildings was not taxed, even hinted that if the House of Lords upheld the decision of the Scotch Courts (to which we referred April 26 last) negativing the possibility of a minus assessable value, legislation would be resorted to to overrule such a decision. An inquiry has been promised into the working of the Finance Act, but no prospect is held out of its early fulfilment. Such an inquiry is urgently needed if the duties are to be continued. It was stated in the debate that there were few appeals, and that less friction was being experienced in obtaining valuations; but we venture to think that this is to some extent due to the fact that the public are under the impression that these unremunerative taxes are likely soon to be abandoned altogether.

It is to be observed that the advocates of the taxes now hardly defend the taxes themselves, but point to the value of the Doomsday Book, which is in creation, and the effect the valuation is having on other taxes. As regards the Doomsday Book, as the valuation proceeds on an entirely hypothetical basis, it is useless from any practical point of view, and certainly can be of no genuine value by the time it is completed, three or four years hence; whilst it is no justification for the land duties themselves that the machinery set up for their exaction has increased the returns from other duties. If this had been the only argument put forward when they were imposed, they never would have found a place in the Statute Book.

PARISH HALL, PORTCHESTER.

The foundation-stone of this hall was laid recently, and the building is to be erected from the designs of Mr. E. Douglas Hoyland, architect, of London. The hall will hold 250 persons, and there will be two classrooms and a kitchen. The builder is Mr. John Croad, of Portsmouth.

THE MEDIÆVAL JOINER.

THE joiner held no very conspicuous position in the Middle Ages. A certain number of references to him and his work occur in the account books of mediæval builders, but such references are very few in comparison with the constantly recurring entries referring to carpenters. From these facts we may very safely draw the conclusion that no very great number of joiners were employed in the Middle Ages, the work proper to the joiner being then commonly executed by the carpenter.

In a manuscript in the Record Office (Exch. Acc. 474-12) some particulars of work done by joiners at the Tower of London in the time of Henry VIII. are set down. Amongst other details we read of work having been done on "dyuers pressys which Master lieutenant hathe to ley his harneys in . . . More wrought by the said Joynours, lxxviii. monyalles (mullions for windows) of tymber in the Kynges gallery and in the counsell chambre, redy wrought, as also the mendyng of the rabettes of the wyndowes."

The joiner sometimes executed work in "fretyng and panelyng" (MS. 465-20). Sometimes, as in MS. 474-5, he was called in to work on "losyng the bed," which perhaps may have been a readjustment of mortise and tenon. Bedsteads were commonly made by carpenters. Instances of joiners working on the wooden framework of the ceiling may be seen in MSS. 474-12 and 499-19. In the former we read, "Taken downe by the saide joynours, the olde selynges of my lady the Kynges grandmother"; in the latter a "joynour" is paid for "selyng" a small chamber.

The wage commonly paid to the mediæval joiner we are unable to discover, the references to his labours consisting for the most part of entries of the payment of a lump sum for the execution of a specified job.

In "The Records of a London City Church," published by the Early English Text Society, we read of a joiner in 1483 occupying a house at a rent of 20s. a year, the house being situated in the churchyard of St. Mary-at-Hill, near London Bridge.

Two curious notes referring to somewhat too exuberant London joiners may be seen in the Acts of the Privy Council, 1543 (Roll Series). The notes are of sufficient interest to warrant insertion in this little notice. The joiners seem to have been acting in some play, and may perhaps have been apprehended in the dress of their respective parts. On April 10, 1543, "Certayne joyners to the number of XX. having made a disguising upon the Sonday morning without respect ether off the day or the ordre whiche was known openlye the Kinges Highness intended to take for the repressing off playes, wer therfore committed to warde and bestowed, summe in the Tower, summe in Neugate, and summe in the Gatehowa."

On April 13 the joiners were set at liberty:

"Certayne joyners which wer committed to warde for theyre unlawfull disguising upon the Sonday before, wer this day, after a good lesson restored to theyre libertie."

LONDON MASTER BUILDERS' ASSOCIATION.

THE Council of the London Master Builders' Association met on May 9, when there was a large and influential attendance. The chair was occupied by the President, Mr. James S. Holliday.

The Special Committee, which was appointed to confer with the representatives of the Carpenters and Joiners *re* Working Rule Agreement, submitted its report of the Conference held on the 1st inst., which was unanimously adopted.

The operation of the National Insurance Act (1911) was considered, and the Council decided to formulate instructions to be sent to the members of this Association for their guidance in carrying out the requirements of the Act.

Various correspondence was read relating to trade matters, including the Railways Bill.

The following were elected members of Association:—(1) Ordinary members, Me H. J. Carter, Ltd., London and Grays, Essex, (2) Messrs. Bovis, Ltd., Upper Berkeley-st W.: (3) Associate member, Mr. J. B. Smith, Hampstead-road, N.W.

BANKRUPTCY BILL.

THE Parliamentary Committee of the Cou of the Society of Incorporated Accountants Auditors have issued their observations recommendations on this Bill, which was in duced into the House of Lords by the Gov ment just before the close of last Session.

The Committee are of opinion that Clau of the Bill, which proposes to punish bankr who have been twice adjudicated and who h twice failed to keep proper accounts, fail meet the needs of the situation. The C mittee point out that there is no hardshi requiring all traders to keep specific book account, as it is the custom of account k manufacturers to issue inexpensive books able to the requirements of those in a s way of business.

On Part 2 of the Bill, which deals deeds of arrangement, the Committee obs that whereas 2,300 estates are annually minsistered in bankruptcy, 3,400 are wound each year under deeds of arrangement, whereas the percentage of assets to liabil in bankruptcy is only 38·4, under deeds arrangement it is 53·3. The Committee that if Clause 25 of the Bill becomes law consider it will legislate deeds of arrangen out of existence by the imposition of condit which, in most cases, it will be impossibl comply with. The Committee make cer recommendations in order to obviate difficulty. The Committee express approva the proposal that all trustees under deeds arrangement should be required to security, but, on the other hand, they p out that the penalty proposed to be put u a trustee acting under a deed of arrangem which becomes void is such that, unless clause (27) be struck out of the Bill or gre modified, persons of credit or repute will venture to act as trustees.

LABOUR IN THE BUILDIN TRADE.

DETAILS are now available of the agreem between the Manchester, Salford, and Dist Building Trades Employers' Association the Joint Committee of the Carpenters Joiners of the district.

For March, April, May, June, July, Aug September, and October the hours will forty-nine and a half per week; in Decem and January, forty-one and a half hours the week. It is stipulated that the wages will be 10d. per hour both summer and win

Overtime is to commence at the times sta for leaving off work, and to be paid at rate of time and a quarter for the first hours; then until ten o'clock at time an half, and from ten o'clock until starting-t next morning at double time. From until four o'clock on Saturdays the overt charge will be time and a half, and fr four o'clock until starting-time on Mon double time.

Where a day's notice has not been given the necessity to work overtime, sixpence be paid as tea-money.

Night gangs (made up of men who h not been employed during the day) are to be inaugurated for less than a week; in these cases the rate of pay will be 1s. 0 per hour.

The boundary within which these rules ap is stipulated to be a radius of 2 miles fr Albert-square as a centre. Travelling expen are allowed in certain circumstances.

Where men have to lodge away from ho they will be allowed 4s. 6d. per week lodging-money and travelling expenses and in once a week. When suitable lodgi cannot be obtained for 4s. 6d., such furt sum will be allowed as is necessary.

In the event of a dispute it is agreed no strike or lock-out shall take place until question has been referred to a local Jo Committee of not more than six employers six operatives. Where there is failure to ag the point of difference will be submitted an umpire mutually agreed on by Committee.

The dispute in the Cardiff building trade is been settled. The men asked for an rease in wages of 1d. per hour, and the djustment of working hours. A Concilin- n Board representing the various trades was ointed, and as the result of their deliberaons the masters offered an increase of ½d. per ir, advance to come into operation when men's short time commences. This was animously accepted by the men's representaes, and an alteration in working hours eptable to both parties was also agreed on.

SCOTTISH BUILDING TRADES FEDERATION.

THE half-yearly meeting of the Executive mmittee of the Scottish Building Trades deration was held in the premises of Edinrgh, Leith, and District Building Trades sociation, 61, Lothian-road, on the 3rd inst. . James Farquharson, Aberdeen, President, upied the chair. Reports from the various tres showed that trade was still very quiet, h no immediate prospects of expansion. twithstanding the state of trade, wages were lined to rise, due to the general unrest and the increase in the cost of living. It was orted that Mr. Farquharson, the President, d been appointed upon the Advisory Comittee in connexion with the National Inance Act, both for Great Britain and ytland. A report upon the working of the was submitted, and consideration was also en to the effect of the Trades Disputes Act, d proposed amendments thereon were con- ered, and strenuous support of the memorial the Employers' Parliamentary Council was ocated. Notwithstanding the depression in trade during the last few years, the deration was reported to be in a united and urishing condition, and the finances were ed to be in a healthy state. It was decided hold the annual meeting in Inverness in tember. The members thereafter, through courtesy of Mr. John MacLeod and Mr. rge, inspected the building of the Usher ll.

THE BRITISH ENGINEERS' ASSOCIATION.

THIS new Association, which was incorated on April 26, is an organisation formed promoting and protecting the interests of itish manufacturing engineers abroad, and cially in China. To that country its mediate attention will be exclusively deed. The objects for which the Association stablished are: -

(1) To promote and protect the general interests of British manufacturing engineers.

(2) To consider all questions connected with such interests.

(3) To promote or oppose legislation and other measures affecting such interests.

(4) To collect and circulate statistics and other information affecting the general interests of British engineers and to diffuse amongst its members information on all matters affecting such interests.

(5) To support the British Government, bankers, financial corporations, shipping and railway companies, and any other organisation in promoting the general interests of British manufacturing engineers.

(6) To watch and report upon the methods and progress of foreign competitors in Asiatic and other markets and to suggest methods of counteracting foreign influences.

(7) To encourage the predominance of British technical instructors in Asiatic and other schools.

(8) To encourage technical colleges and schools in Great Britain to give facilities for Oriental and other students, and to establish or aid in the establishment of technical schools abroad for the furtherance of the objects of this Association.

(9) To aid by advice, co-operation, donations, or otherwise, any individual or concern who is able to promote the objects of this Association.

(10) To invite members of the Association to give facilities for the introduction into their works for varying periods of Oriental and other engineers or engineering students.

(11) To endeavour to make the English language the recognised medium for the transaction of all engineering business.

The funds of the Association are derived from the subscriptions of members and ance fees. The first 200 members will be itted without an entrance fee. The annual cription for the time being has been fixed en guineas.

the first applicants for membership, two lred "original members," taken in the order of the priority of their application, will have the advantage of securing full membership from the date of election until December 31, 1914, by a subscription of 25*l*.

The benefits which members will derive from the Association forthwith may be summarised as follows:—

(1) They will be in receipt at frequent intervals of reports on matters which affect their business interests in China. These reports will be issued without the delay which is incurred in the issuing of Government information, and they will be untrammelled by those restricting influences which rob Government reports of their practical value. They will also be issued only to members.

(2) Members will be able to apply to the Association in London for information on specific subjects, and for advice on matters relating to China.

(3) Members who may be sending representatives to China will be able to obtain for them introductions and advice on the spot from the Association's Commissioner in China.

(4) Members will have the opportunity of exchanging views with each other, and thus will have facilities for collaborating in a business policy for China.

(5) Members will be warned of undesirable business connexions in China.

(6) Members will be notified of any important Chinese who may be in Europe in connexion with engineering contracts.

(7) Members will be notified of useful prospective Chinese engineering students, should they wish to introduce them into their works.

The temporary offices of the Association are Nos. 38, 39, 55, and 54 (first floor), Queen Anne's-chambers, Westminster, S.W. We may mention that some well-known firms have already joined the Association.

THE LONDON CO-OPERATIVE UNION OF BUILDERS, CONTRACTORS, AND ALLIED TRADES.

A GENERAL meeting of the London Co-operative Union of Builders, Contractors, and Allied Trades, Ltd., took place at the registered offices, 45 and 46, Lower Marsh. The appointment of Mr. Josephson as Secretary was confirmed by the general body. Mr. Atkinson, Mr. Eslenham, Mr. Taylor, Mr. Ockenden, Mr. Small, have been elected as Committeemen, and Mr. J. Atkinson, of Gerrard-street, W., has been elected Chairman.

In the course of some remarks, Mr. Josephson gave a brief history of the Union. He pointed out the advantages of the Union, *i.e.* :—(a) No rich man can buy shares in the Union. (b) No member can belong to the Union unless he subscribes for fifty shares. (c) No workman, no matter how poor, is to be debarred from becoming a member, because every man can well afford to pay sixpence out of a pound earned towards the fifty shares, which he is obliged to subscribe.

The founders have agreed to give their services (including the Secretary) until the Union has work in hand and actually starts business, and it is not burdened with any preliminary expenses. It appears that a contract for 2,600*l*. has been secured, which will give forty men employment for from three to four months.

GENERAL BUILDING NEWS.

CHESSINGTON CHURCH, SURREY.

This little church, situate upon the Ewell-road, and owing its existence to its founder, Roger de Merton, of Merton Abbey (in later years occupied by Nelson), has been enlarged, a vestry and organ chamber having been added and other works approved by the I.C.B.S executed. The exterior is faced in flint with stone dressing. The work was dedicated on the 1st inst. by the Bishop of Southwark, and has been designed by Mr. A. H. Ryan Tenison, F.R.I.B.A., the contractor being Mr. Hobbs, of Thames Ditton.

NEW GUILDHALL, MIDDLESEX.

The foundation-stone of the Guildhall was laid on the 9th inst., and the building is being erected at a cost of about 85,000*l*. On the ground floor will be the public hall, two Quarter Sessions courts, and various offices Committee-rooms and offices will be accommodated on the first floor, and the Council chamber will be on the second floor. The contract is being carried out by Mr. James Carmichael, and the architects are Messrs. J. S. Gibson, Skipwith, & Gordon. The building was illustrated in our issue for March 3, 1911.

TRADE NEWS.

Referring to our article on "Ottawa" in our issue for May 3, the Leeds Fireclay Company, Ltd., inform us that the whole of the front of the Canadian Life Building, Ottawa, is in "Burmantofts Marmo" terra-cotta, supplied by them.

Under the direction of Mr. Arthur P. Harrison, architect, High Cross, Keighley, Boyle's latest patent "air-pump" ventilators have been supplied to Highfield School, Keighley.

Boyle's latest patent "air-pump" ventilators have also been supplied to the Grammar School, Horsham.

In our issue for the 3rd inst., under "Trade Catalogues," we stated that the Armorduct also manufacture the now well-known "Holophane" glass reflectors. We are informed that this is incorrect, and that the sole manufacturers of "Holophane" glassware are Messrs. Holophane, Ltd., and the Armorduct Manufacturing Company, Ltd., only list and sell these goods in the ordinary way of business.

The new Catholic Schools, Caterham, are being supplied with Shorland's patent Manchester grates and patent concealed extract ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

St. John's Schools, Cardiff, are being supplied with the firm's warm-air ventilating patent Manchester grates.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

Mann; addition to Messrs. Loveless & Co offices, Amyand Park-road, for Messrs. Brew Smith, & Brewer.

Walsall. — Plans have been passed follows: — Alterations and additions premises, 18, Junction-street, for Messrs. sells Brewery Company; electric theatre, Hi street, Bloxwich, for Mr. R. Mountjoy; offic Hatherton street, for Mr. T. L. Hale; fo houses, Green-lane, Leamore, for Mr. Wilkes; curriers' works, off Marsh-street, Messrs. Middlemore & Lamplugh.

Woolley.—Club premises; Secretary, Wo ing Men's Club, Darton.

Yarm. — Alterations and additions grammar school; Mr. E. G. Fletcher, arc rect, Prince Regent-street, Durham.

* See also our list of Competitions, Contracts, etc., on another page.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of the Westminster City Council on May 8 the following matters were dealt with:—

Gifts.—The thanks of the Council were presented to Alderman Emden for his gift of books and of views of London, by Messrs. Pugin & Rowlandson.

Building in Tufton-street.—Permission was given to Messrs. A. E. Hughes & Son to take up and remove the old paving-stones in connexion with the clearing of the site of Tripp's Buildings, and 87-91, Tufton-street, preparatory to erecting new buildings.

Improvement of Tufton-road and Horseferry-road.—It was decided that the London County Council be informed that the City Council are willing to contribute a sum not exceeding one-fourth of the net cost of a widening of Horseferry road, between Carpenter street and Tufton-street, to 50 ft., and a widening of Tufton street, between Horseferry-road and Romney-street, to about 33 ft., such contribution not to exceed the sum of 1,088*l.*

Paving Works.—The Contracts Committee reported that in preparing the form of contract for paving work this year, on recommendations of the City Engineer, they had advised the specification by providing for 9 in. Portland cement concrete to be laid instead of 7 in. formerly specified, and by redrafting the clause relating to the laying of combined "strip" pavement so as to make it clear that the pavement shall consist of alternate rows of Jarrah and pine blocks.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

The annual dinner and visits of inspection of the Association were held on the 4th inst. About thirty members and friends were present at the visits. A start was made at 2.5 from Turnham-green Station, from whence the party proceeded to the Metropolitan Electric Supply Company's generating-station at Willesden, where the party was conducted over the works by Mr. Markby, the engineer of the works, and by Mr. Chapman. Upon leaving the generating-station the party proceeded to the Willesden Isolation Hospital, where, by permission of the Willesden Council and of the Medical Superintendent, Dr. Stewart, they made an inspection of the administrative block and the laundry, which is believed to be one of the best equipped laundries in the country. Next, by permission of the Willesden Council and Mr. O. Claude Jebson, the Engineer and Surveyor, the party stopped to inspect a sewage recorder, which registers the Willesden sewage as it enters the London County Council's sewer. The working of the recorder was explained to members of the party by Mr. Cole.

The party then proceeded to the Brentford Gas Company's works, where tea was provided by Mr. A. A. Johnston, the engineer and manager to the company. After tea, by permission of the company, the party was conducted in three sections over the gasworks, where the process of emptying and recharging of retorts was viewed, after which an inspection was made of the water gas, stove cleaning, and smiths' departments. After the visit to the Brentford Gas Company's works had been concluded the party proceeded to the Chiswick Town Hall, where the annual dinner was held. The following gentlemen were present:—The President; Messrs. H. T. Wakeley, County Surveyor, Middlesex; A. A. Johnston, engineer and manager Brentford Gas works; E. F. Collins, R. H. Jeffes, H. V. Lobjoit, S. H. Chambers, A. H. Vanner, M. Ainsworth King, Powell Thomas Cole, W. F. Coales, J. G. Carey, T. W. Pearce, Percy Stevenson, F. C. Fread, Chambers-Smith, H. Cooper, T. Cook, J. H. Abbott, S. Eyden, A. G. Davies, J. H. Chapman, J. H. Berley, C. Willis, T. Cole, jun., A. Gladwell, W. Manning, J. A. Webb, R. J. Thomas, Miss Leith, and the Hon. Secretary.

LEGAL COLUMN.

Land Valuation.

The President of the Land Union, in a recent letter to the *Times*, draws attention to the decision of one of the Referees under the Finance Act in what is known as the Liverpool case. The facts are very shortly stated, but apparently a property valued by the official Referee at 750*l.* was sold for 1,000*l.*, and the Referee decided that the price obtained was to be regarded, both on the original valuation and on "the occasion." We cannot but regret that the Land Union did not publish further particulars, as a good deal depends upon when the land was sold and how long an interval elapsed between the sale and the original valuation, the deductions made, etc.

The case, however, serves one purpose, as it affords one more example of a reversal of the original valuation on appeal. The time for taking steps to appeal is extremely short—sixty days—and many persons, as was the case in the Richmond case, hardly grasp the importance of appealing until the time has expired; others also shrink from the expense of an appeal, and if an appeal be made to a Referee his decision is not published, and is not binding on the valuers or of any public significance. We thus have one of the most intricate statutes of modern times administered in a happy-go-lucky manner, whilst access to the Court is made a luxury which only the wealthy can afford. Yet when questions are asked in the House of Commons the absence of appeals is the one fact which the Government rely upon as proving the equitable working of the Act. In face of the assertions that were made when the Act was passed, that it was calculated to bring large properties into the market and to stimulate building enterprise, it surely is a significant fact that most of the cases to which publicity has been given have been cases where the properties have been valued at under 1,000*l.* Certainty and uniformity in the administration of the Act are urgently called for, and this can only be attained by a ready access to the Courts of Law whose decisions are binding upon all valuers, and enables an injunction to be applied for where the principle of the decisions is departed from.

Boundaries to Land.

All builders have had some experience of the difficulties which may arise in connexion with the boundaries of properties, and this is equally the case where land is left unbounded or where a wall or other erection has been erected which is within the owned territory, leaving an unenclosed strip outside.

A case, Kynoch, Ltd. *v.* Rowlands (current "Law Reports"), turned on the latter state of affairs. The plaintiffs had erected a wall enclosing their works, and at the eastern side these works were divided from the defendant's property by a ditch or dry channel of an ancient watercourse. There had, in 1894, been litigation between the two parties, and in that action it had been determined that the boundary line between the two properties was the middle of this channel. That left a strip of land in the plaintiffs' possession averaging 18 in. outside the face of the wall, and extending further than the footings. The present action was brought to prevent the defendant from topping refuse against the wall. The defendant contended that by the erection of the wall the plaintiffs had abandoned this strip of land, and that the defendant had acquired a right to it by prescription.

The grounds upon which a prescriptive right was alleged to have been acquired were that cattle had been allowed to graze right up to the wall.

The Court of Appeal, affirming the Court below, held that there had been no abandonment of this strip of land by the plaintiffs, nor had the defendant acquired it, and an injunction and damages were decreed against the defendant.

It should be especially noted that in this case, during the erection of the wall, there had been litigation between the parties, and that in that litigation the boundary line between the two properties had been absolutely determined. It was not, therefore, a case where the existence of a wall erected by the plaintiffs could be used as a presumption that the wall marked the actual boundary. Even had that been the case, Lord Justice Fletcher Moulton intimated that it would be improper to infer from the mere fact of the building of the wall an intention on the part of the owner to abandon all lying outside it. One word may be added upon the point of prescription. To gain a prescriptive right it was held that the person acquiring the property must take actual possession, as, for instance, by cultivation, building, paving, etc. The mere straying of cattle upon the property did not amount to an act of possession, whilst in this case the plaintiffs had exercised acts of ownership by using the strip of land occasionally when the wall required repairing.

Landlord and Tenant.

No class of agreements or contracts are often entered into with less formality than are agreements relating to house property. Often a house agent's printed form is accepted by both parties, or they are even satisfied with a document of their own drafting, yet such agreements are subject to technical rules of construction which cannot be appreciated by laymen. If a lease be drawn, for instance, "for the term of two years certain, and thereafter from year to year, until either party shall give to the other three calendar months' notice of his determination to terminate the tenancy," all laymen, and even some lawyers, might be inclined to think that at the end of the second year the lease could be determined; but in the case in *re* Searle (current "Law Reports") this has been decided not to be the case, but to be a lease for three years at least, and then only determinable by three months' (calendar months) notice, expiring at the end of the third or any subsequent year. We may remind our readers that "calendar months" means calendar months, and a quarter's notice may not suffice (see the *Builder*, June 25, 1910).

The Trade Disputes Act.

A case recently tried before Mr. Justice Coleridge—Scruttons, Ltd., *v.* Lewis—turned to some extent upon the Trade Disputes Act. The plaintiffs were suing a delegate of the Transport Union for having wrongfully and maliciously induced the plaintiffs' servants to break their contracts, and for an injunction. The defendant set up sect. 3 of the Trade Disputes Act. There was naturally some conflict of evidence in the case, but it appeared that certain men were employed in loading a vessel, that on one day a delegate of the union, according to the rules of the society, went round to inquire whether the men had union tickets, that one of the masters of the barges had no ticket and declined to take one out, and that in consequence the men working with him ceased work, this fact having been communicated to their foreman. The learned Judge entered judgment for the defendant, apparently upon two grounds—the first that no actionable interference with the plaintiffs' servants had taken place. This would seem a ground easily understood, even apart from the Trade Disputes Act; but his Lordship further found that even had there been actionable interference with the plaintiffs' servants, a trade dispute existed between the men—the stevedores and lightermen—and therefore sect. 3 of the Act would apply.

We, of course, in no way question this finding, and we only refer to the case as illustrating the difficulty of administrating the Trade Disputes Act. From the evidence as reported there appears to have been no active antagonism between the men beforehand. But the unions discourage their men from working with non-union men, and the revelation of the fact that one of the men was a non-union man led to a suspension of work. Lord Coleridge observed that the Act must not be whittled away, but under the Act it seems clear that there must be an antecedent dispute for the section to apply, and that the act complained of cannot be relied upon as the dispute. This was carefully considered by the House of Lords in Conway *v.* Wade (see the *Builder*, August 7, 1909), and it was held that the dispute must be imminent or existing, a grumbling or agitation would not suffice.

The case raises an important point, because it is not on all fours with the facts in Conway *v.* Wade, where the matter in issue was only the non-payment of an old fine to the union; in fact, a dispute between a trade union delegate and a workman. There is a rule in all unions that non-union men shall not be employed; if, therefore, a non-union man is employed, does this *ipso facto* create a dispute among the men? In the interests of trade generally it is to be hoped that this question can be answered in the negative, for it places employers and non-union men in the hands of the unions if, owing to the employment of a non-union man, illegal interference with employers can be exerted and the protection of the Trade Disputes Act can be invoked without any warning or the previous existence of any grounds for dispute.

LAW REPORTS.

COURT OF APPEAL.

(Before the MASTER OF THE ROLLS and Lords Justices BUCKLEY and KENNEDY.)

Blackfriars Ancient Light Dispute: Griffith *v.* Richard Clay & Sons, Ltd.

THIS case came on for hearing on the 8th inst., upon the appeal of the defendants from a judgment of Mr. Justice Neville, in the Chancery Division.

Mr. C. E. Jenkins, K.C., and Mr. Vernon appeared for the appellants; and Mr. Peterson, K.C., and Mr. Gover for the respondent upon the appeal (the plaintiff).

Mr. Jenkins said it was the appeal of the defendants from a judgment of the learned Judge in favour of the plaintiff for 200*l.*

damages for the obstruction by the defendants of his ancient lights. In the Court below there was a considerable dispute as to the facts, but in that Court he did not think there would be any dispute of fact upon any material point, the point raised upon the appeal being one of law of the greatest importance to persons engaged in the building trade. Plaintiff was the owner in fee simple of two small houses known as Nos. 62 and 63 on the east side of Brunswick street, near Stamford-street, Blackfriars. Defendants, the well-known firm of printers, were the lessees for a long term of a large new building opposite the plaintiff's premises on the west side of Brunswick-street. The buildings which formerly stood on the site of the defendants' new building were much lower than the new one. Defendants erected their new building without any objection by the plaintiff, but when the building had got substantially to its full height the plaintiff brought his action for damages for the obstruction of his ancient lights.

The Master of the Rolls: Obscuration was admitted?

Mr. Jenkins: Oh, yes!

The Master of the Rolls: Then we have nothing to do with the Colls case?

Mr. Jenkins thought not. He said that, although the plaintiff by his statement of claim asked for an injunction, it was admitted that in the circumstances he could not get it. Defendants admitted that there had been an actionable interference with the plaintiff's lights. Their surveyors told them that the damage to the plaintiff caused by the interference was about 75*l*., but in order to be on the safe side defendants paid 150*l*. into Court. The only dispute at the trial was as to the amount. At the trial the learned Judge said that if he looked at the plaintiff's position as the owner of Nos. 62 and 63, Brunswick street, and considered the case from the point of view of the letting or selling value of the premises, the 150*l*. paid into Court was more than enough to compensate the plaintiff for the damage he had suffered. It appeared, however, that the plaintiff in addition to being the owner of Nos. 62 and 63, Brunswick-street, was also the owner of another building behind Nos. 62 and 63, known as No. 63A, the latter building being separately rated from the others, and the plaintiff's expert witnesses presented this theory to the Court. They said that the houses, Nos. 62 and 63, were old, small, narrow, dilapidated houses, and which did not themselves represent much value; but they said that if they put the three houses together and pulled them down they would get a site of sufficient size or depth to erect a warehouse upon it.

The Master of the Rolls: Are all the houses subject to one title?

Mr. Jenkins thought not.

Mr. Peterson thought they were.

Mr. Jenkins would admit that at one time there was a common owner. No. 63A, he said, was a warehouse. No. 62, although rather deeper than No. 63, was a good deal narrower and smaller. It had a little window, which was below the level of the pavement. That was one of the windows the defendants were alleged to have blocked, as also a window on the gound floor and two on the first floor No. 63 had three windows in the basement, the tops of which slightly protruded above the pavement level, and three windows on the ground floor and three windows on the first floor, the light to which the defendants were said to have interfered with. The depth of No. 63 was approximately from 18 ft. to 19 ft., and the depth of No. 62 was something over 20 ft. The total surface area of the two houses was about 1,000 sq. ft. The total surface area of No. 63A was about 1,050 sq. ft., and in that building there were no windows looking towards the defendants. Defendants admitted that so far as the dominant tenement was concerned there had been a nuisance, and that they had to pay for that; but the point was whether the plaintiff was entitled as against the tort feasors to have the damages assessed upon the footing that what they had done made the whole site less valuable if the houses were pulled down, or, in other words, was the plaintiff entitled to get 200*l*. for the loss he had suffered? The learned Judge had said he was.

In reply to the Master of the Rolls, Mr. Peterson said that No. 63A was let on a monthly tenancy.

The Master of the Rolls said that if the plaintiff was minded to enter into an arrangement to pull down his three premises, and for the erection of one building over the whole site, the obstruction of light would interfere with that. He could not see why that fact should not be taken into consideration.

Mr. Jenkins contended that it ought not. So far as his research went, he could not find a similar claim put forward by a plaintiff before. Mr. Justice Neville had measured the damages by saying that a man would probably pay 200*l*. more for the three sites combined than he would pay for them separately. He submitted that this was simply a common law action for damages, and that fact was not altered because the action happened to be tried in the Chancery Division. He contended that the damages in the present case must be confined to the injury to the dominant tenement. It was clear that No. 63A was not the dominant tenement or part of it. He submitted that damage arrived at in that way could not be charged against the defendants.

Mr. Vernon followed on the same side, contending that the Judge had assessed the damages on the wrong basis. All that the plaintiff had a right to was to have the damages assessed for the damages to the light coming to his two dwelling-houses.

Lord Justice Kennedy thought that they ought to look at the premises as a whole as a marketable commodity.

The Master of the Rolls said that they had not to take into consideration the *quantum* of damages at all, if the Judge had properly taken into consideration the site of No. 63A.

Mr. Vernon contended that the Judge had no right to take into consideration the site of No. 63A, which was not the site of the dominant tenement at all. He contended that the only right which the plaintiff had was to have light through the apertures of the dominant tenement actually existing.

Counsel for the respondent were not called upon.

The Master of the Rolls, in the course of his judgment, said it was apparent that eventually No. 63A was a property which must be taken down and the site used for another building. It was also apparent that the neighbourhood was one which was being now covered by large buildings in the nature of factories and warehouses, and the point they had to consider was the measure of damages, and what they were entitled to take into consideration in assessing the damages for the wrong which it was admitted the plaintiff had suffered. In the first place the plaintiff had not, by reason of delay in commencing proceedings, been able to obtain an injunction. It was clear that if he had commenced the proceedings in time he could have obtained an injunction which would have prevented the defendants from building any part of that which was opposite Brunswick-street beyond the line shown on the model, which, he supposed, was the 45 degrees angle, that protection would have enured for the benefit of the whole site, and the plaintiff would have had the right to treat it as a whole. To suggest that anybody could rebuild the two buildings upon the foundations of their own site was absurd and impossible. It was said by the defendants that that might have been so in the case of an injunction, but that it was not so in a case where no injunction was asked, and that it had no application at all where damages only were asked. His Lordship asked himself, why not? A wrongful act had been committed by the defendants. What damage had the plaintiff suffered? It had been argued that if there was a house with a garden on one side of it or in the rear, the only thing you could do in such a case was to say what damage had accrued to the plaintiff with reference only to the actual building in which there were ancient lights. It was said that you must disregard altogether that it was a house with a garden at the back or side, and that all you were entitled to consider was the value of the rays of light which had been prevented from coming into the apertures of the house. He failed to see that the Colls case had any bearing on a question of damages. He failed to see why in a case like the present they should not consider the damage done to the plaintiff's whole site. He thought this was a case in which they were not merely to consider what damage the plaintiff had suffered by reason of the wrongful act of the defendants in interfering with the plaintiff's ancient lights. He thought that the learned Judge was quite right in the view he took, and that the appeal should be dismissed with costs.

The Lords Justices delivered judgments to the same effect.

HIGH COURT OF JUSTICE, CHANCERY DIVISION.

(Before Mr. Justice JOYCE.)

Tottenham Right of Way Case: Tottenham Urban District Council *v.* Rowley.

JUDGMENT was delivered in this case on the 11th inst. upon a claim by the plaintiffs for the alleged trespass by the defendant upon their land known as Downhills Park, Keston-road, Tottenham, and for damages for nuisance caused by the defendant erecting an obstruction on the land or alternately upon Keston-road, in such a way as to prevent a impede the plaintiffs from entering upon th land from Keston-road, and for a declarati that the defendant was not entitled to er or maintain any obstruction, either up plaintiffs' land or on Keston-road, or in a other manner to prevent or impede plaintiffs from entering upon their land fr Keston-road; and for an injunction to restra the defendant from erecting or maintaini any obstruction upon the plaintiffs' land, upon Keston-road, and from in any manr preventing or impeding the plaintiffs fr entering upon their land from Keston-road.

It appeared that the land north of Keston-road belonged to the plaintiffs, a was used as a public park, and was separat from Keston-road by a wooden pale fer erected some years ago by the plaintiffs the edge of their land. Some time ago th removed a part of the fence so as to allow ingress and egress through the opening th made to and from their land, for the purp of conveying materials in connexion with t building by them of a new school on th land at some little distance from the ro The defendant, who had some time bef purchased the tract of land south of and to the fence, put up a wire fence in front the opening made by the plaintiffs, his jus fication for doing so being the allegation th the Keston road was a private road, and th he owned the narrow strip of land betwe the road and the plaintiffs' fence. Defends had laid out his land as a building estate, a it was now practically all built upon, exc what had been appropriated for roads streets on the south side of Keston-road, portion in question being built upon, leavi roadway between the houses and the fen The real question in the case was whether, the circumstances, there had been a dedicati by the defendant of Keston-road as a highw for public use.

Mr. Justice Joyce held upon the evider that the defendant intended to dedicate whole width to the public as a highway, s the user by the public had been sufficient complete such dedication. He held, the fore, that the defence failed, and that plaintiffs were entitled to succeed.

Judgment accordingly.

Mr. Macmorran, K.C., and Mr. C. Shar appeared for the plaintiffs; and Mr. Young K.C., and Mr. J. Scholefield for defendant.

Case under the London Building Act, 1894: Neglect to Give Notice.

ON May 7, at the South-Western Police-cou before the Hon. de Grey, Messrs. S. B. F man & Co., shop-front builders, of Westga street, The Triangle, Hackney, were summo by Mr. H. T. Bromley, District Surveyor Wandsworth East, for neglecting to give not to the District Surveyor, as required by sect. of the London Building Act of 1894, of construction of a new shop front at No. Balham High-road.

Evidence was given that when the Distr Surveyor discovered the work he found t large blocks of granite, forming the plinth the recessed entrance to the shop, had be laid upon the wooden floor joists of the sh below which there is a basement story.

Those joists were in a decayed conditi and the District Surveyor found it necessa in order to prevent an accident, to have floor temporarily shored up and brick pi built to support the blocks of granite.

The defendants urged in defence that t had given notice, because they had obtained licence from the Wandsworth Borough Cour to erect a hoarding on the pavement.

It was pointed out that the District Surve was an entirely different authority, and t the fact of the defendants having obtaine licence to erect a hoarding on the pavement not relieve them from their obligation to se the statutory notice upon the District Surve as required by the London Building Act, 1

The magistrate fined the defendants 1*l*. 1*l*. 3*s*. costs.

PARISH CHURCH, SALL, NORFOLK.

The fine cruciform church, with lofty battled tower, of SS. Peter and Paul, of S near Aylsham, has been reopened, after restoration, under the directions and supe tendence of Mr. J. A. Reeve, for the nave south aisle, and of Mr. W. Weir, architect the Society for the Protection of Anc Buildings, for the north transept and res the fabric, at the charges, amounting to s 3,000*l*., of Sir Alfred Jodrell and Mr. Wool White, of Sall Park. The new church fu ture and organ-case were designed by E. W. Gimson, of Cirencester.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments,]—; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

AY 18.—**Hastings.**—SUNK ARENA AND BAND-ND.—Cost not to exceed 4,500*l.* Premiums, and 10 guineas. Particulars from the Town rk, Hastings.

AY 21.—**Middlesex Hospital.** MURAL ORATIONS THERE AND ELSEWHERE.—Particulars n Crosby Hall, Cheyne-walk, Chelsea.

AY 22.—**Southend-on-Sea.**—HAMSTEL COUNCIL HOOL. Architects practising in the borough y. Premiums, 25*l.*, 15*l.*, and 10*l.* Particulars m the Education Office, Municipal Buildings, thend-on-Sea.

AY 25.—**A.A. Journal.**—DESIGN FOR COVER. e "Competition News" (page 574).

AY 25. — **Lymington.** — PUBLIC OFFICES.— rty and fifteen guineas for second and third gns. Assessor, Mr. R. J. Gutteridge, .I.B.A. Particulars from the Town Clerk, nington.

NE 1.—**Dunfermline.**—INSTITUTE AT NETHER-N.—Cost not to exceed 7,000*l.* Premiums of 15*l.*, and 10*l.* Assessor, Mr. E. A. Jamieson, rticulars from the Secretary, Carnegie Trust, ot-street, Dunfermline.

NE 3.—**Sheffield.** — CRIPPLES' HOME.— ited to local architects. Mr. E. M. Gibbs, .I.B.A., and Mr. F. E. P. Edwards, .I.B.A., assessors.

JUNE 14.—**Conisbrough.** — ADDITIONS TO PITAL. The Doncaster and Mexbrough Joint pital Board invite competitive plans for additi to Isolation Hospital. See advertisement his issue for further particulars

NE 28.—**Hale, Cheshire.** -TOWN PLANNING EME.—Premiums 50*l.* and 25*l.* Particulars the Council Offices, Hale.

NE 28.—**Regent's Quadrant.** DESIGN FOR ATMENT.—Premiums, 25 guineas, and 25 eas divided. Adjudicators, Mr. E. A. ards and Mr. Alan E. Munby. See advertise-t in this issue for further particulars; also "Competition News," issue of April 19 (page 453), 3 (page 512), May 10 (page 537), and this (page 573).

NE 30.—**Padiham.**—TOWN HALL, BATHS, ETC. emiums 40*l.* and 20*l.* Particulars from Mr. Gregson, A.M.Inst.C.E., Surveyor's Office, ham.

LY 1.—**Dusseldorf.**—A plan for the nsion of the City of Dusseldorf. Premiums 9,000*l.* to 375*l.* Conditions on application to Chief Burgomaster, Dusseldorf. A transla- appeared on page 365, September 29.

LY 1.—**Port of London.**—NEW OFFICES.— ted to those mentioned in "Competition s," issue of April 12 (page 424).

GUST 6.—**Cardiff.** — FIRE-STATION. — The iff Corporation invite designs and estimates fire brigade station in Westgate-street. Mr Marshall Mackenzie, assessor. Particulars the Town Clerk, City Hall, Cardiff.

GUST 30. — SAXON SNELL PRIZE. Fifty eas; with medal, is offered for essay on a ital subject. Particulars from the Sanitary tute, 90, Buckingham Palace-road, S.W.

TOBER 1. — **Ottawa.** - MONUMENT TO KING ARD VII.—Sketch models in plaster to be to the Director of National Art Gallery, wa.

DATE.—**Birmingham.**—BATHS.—Twenty and linéas for second and third designs. Appli-ns for conditions to be sent to the Super-dent Engineer, Kent-street, Birmingham

DATE.—**Cardiff.** MODEL COLLIERY TOWN. South Wales colliery company offers a prize 1*l.* for the best scheme for a model colliery See advertisement in issue of April 26 for er particulars.

DATE.—**Jordanhill, Glasgow.**—PROPOSED NING COLLEGE.—Limited to six firms, named mpetition News, December 1, page 635.

DATE. — **Warrington.** — SCHOOL. — The rrington Education Committee invite com-ive plans for the erection of a public ntary school. See advertisement in issue bruary 16 for further particulars.

Contracts.

BUILDING.

date given at the commencement of each raph is the latest date when the tender, or ames of those willing to submit tenders, be sent in.

17.—**Hirwain.** HOUSE.—Erection of a adjoining Cross Bychan Inn, near Hirwain. ings and specifications with Mr. J. Llewellin , M.S.A., Aberdare.

17.—**Northampton.**—SHEDS, ETC.—Erec-of wooden dressing-sheds, corrugated-iron fencing, etc., at Kingsthorpe bathing-place. Specifications, quantities, and forms of tender from Mr. Alfred Fidler, M.Inst.C.E., Borough Engineer, Guildhall.

MAY 18.—**Ballyclough.**—OFFICE.—For erecting an office building. Plan and specification with Mr. J. M'Aleenan, C.E., Castlewellan.

MAY 18.—**Batley.**—FOUNDRY, ETC.—Erection of brass foundry and workshop, Jack-lane, Batley Carr. Plans and specifications seen, and quantities from Mr. John H. Brearley, architect, 68, Commercial-street, Batley.

MAY 18.—**Bedwas.**—COTTAGES. -Erection of about thirty cottages, for the Bedwas Glebe No. 1 Building Club. Plans and specifications seen, and particulars from the architect, Church-street, Pontypridd.

MAY 18.—**Belfast.** -REPAIRS.—For reslating and general repairs of Gargory R.C. Church, near Ballyward Station. Specification with Messrs. Hobart & Heron, architects, Scottish Provident-buildings, Belfast.

MAY 18.—**Bridgend.** ALTERATIONS.—For converting the schoolroom at the Cottage Homes into an isolation hospital. Plans, etc., seen, and particulars from Mr. P. J. Thomas, architect, Bridgend.

MAY 18.—**Charleville.**—ROOM.—For the building of a churning-room. Plans and specifications by Mr. J. Fant, I.A.O.S. Mr. J. O'Leary, Secretary, Ballygran Co-operative Creamery, Ltd., Ballygran, Charleville.

MAY 18.—**Christchurch.** -WALL, ETC -Erection of a wall and construction of a concrete floor at the Workhouse, Fairmile. Plan and specification at the Workhouse.

MAY 18.—**Hemsby.** -HOUSE.—For erection of a house. Plans and specification seen, and quantities from Messrs. A. F. Scott & Son, architects and surveyors, 24, Castle-meadow, Norwich, and 12, Holborn-hall, London, W.C.

MAY 18. **Llangorse.**—ADDITIONS.—For additions to Penllanafol Farm. Plans and specification with Mr. C. H. Elford, M.S.A., architect, Aberdare.

MAY 18.—**Selby.**—ALTERATIONS.—For alterations at the Board-room, Workhouse, Selby. Plans and specifications with Mr. J. Townend, Clerk, Poor Law Offices, 1, Abbey-place, Selby.

MAY 18.—**Skerries.** -SCHOOLS.—Erection of new National Schools of St. Patrick. Plans and specification with Messrs. Anthony Scott & Son, architects, 49, Upper O'Connell-street, Dublin. Quantities by Mr. James Mackey, J.P., 58, Dame-street, Dublin.

MAY 18.—**Stonehouse.** -CENTRE.—Erection of a handicraft and cookery centre at Stonehouse Council School. Drawings and specification, on deposit of 1*l.* 1s., from Mr. R. S. Phillips, architect, Shire Hall, Gloucester.

MAY 18.—**West Thurrock.**—HOUSE.—For the construction of a house. Specifications and plans with Mr. W. T. Clapton, architect, 28, Bushwood-road Leytonstone.

MAY 20. **Bradfield.**—WALLS, ETC.—For erection of boundary walls, conveniences, etc., at the Bradfield Midhope Stones Council School. Plans seen, and specifications with quantities from the Education Architect, County Hall, Wakefield.

MAY 20.—**Bramley.** HOUSE. For erection of a head teacher's house at Bramley and Wickersley Council School. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 1*l.*

MAY 20.—**Cardiff.**—ADDITIONS, ETC -For alterations and additions to No. 51, Mountstuart-square. Messrs. I. Jones & P. Thomas, architects, 18, St Mary street, Cardiff. Deposit of 2*l.* 2s. for quantities.

MAY 20. **Tain.** POST OFFICE.—Erection of a new post office. Plans and specifications with Messrs. A. Maitland & Sons, Tain.

MAY 21.—**Cardiff.** STATION, ETC. Erection of a disinfecting station, etc., Crawshay-lane, Cardiff. Drawings and specification seen, and quantities at the City Engineer's Office, City Hall, Cardiff.

MAY 21.—**Cork.**—IMPROVEMENTS.—For improvements at Messrs. Suttons, 1, South-mall, Cork. Plans and specification with the architect, Mr. Samuel F. Hynes, F.R.I.B.A., 5, South-mall, Cork.

MAY 21.—**Newbury.**—ADDITION.—For addition to the Isolation Hospital. Plans and particulars from Mr. S. J. L. Vincent, Borough Surveyor.

MAY 21.—**Paddock.** HOUSES, ETC. Erection of two semi-detached houses, also additions to workshop, Paddock. Plans seen, and quantities from Messrs. Lunn & Kaye, architects and surveyors, Milnsbridge.

MAY 22. **Fazakerley.**—ADDITIONS, ETC.—For proposed additions and alterations to Infirmary building, Cottage Homes, Fazakerley. Quantities on deposit of 2*l.* 2s. Drawings with architect, Mr. C. H. Lancaster, Brougham-terrace, West Derby-road, Liverpool.

MAY 22.—**Harwich.**—CONVENIENCE.—For erection of a convenience in the grounds of Cliffe Park. Plans and specification at 41, Church-street.

MAY 22.—**London.**—WALL.—For repairs to the boundary wall at Infirmary, Hoxton-street, N. Specification, with forms of tender, from the Guardians' Architect, Mr. F. J. Smith, F.R.I.B.A., Parliament-mansions, Victoria-street, S.W.

MAY 22.—**Manchester.**—FLATS.—For the erection of ninety cottage flats at Barracks-street, Hulme. Drawings seen, and specification and quantities from the City Architect, Town Hall. Deposit of 2*l.* 2s.

MAY 22. -**Oswestry.** -LODGE.—For erection of a park-keeper's lodge at Cae Glas Park. Plans, specification, and conditions seen, and quantities and form of tender, on deposit of 10s. 6d., from Mr. G. William Lacey, M.Inst.M.C.E., Borough Engineer and Surveyor, Guildhall, Oswestry.

MAY 22.—**Pontardawe.**—OFFICES.—For erection of union offices in Holly-street, Pontardawe. Plans seen, and specification, quantities, and form of tender from Mr. J. Morgan, architect, Herbert-chambers, Pontardawe. Deposit of 5*l.*

* MAY 22.—**Poplar.**—GUTTERING REPAIRS.—The Poplar Guardians invite tenders for works to the gutters at Workhouse. See advertisement in this issue for further particulars.

* MAY 22. — **Ware.** — BOILER-HOUSE, ETC.—The Guardians of Ware Union invite tenders for erection of a boiler-house and other alterations at the Workhouse at Ware, Herts. See advertisement in this issue for further particulars.

MAY 23.—**Abercrch.** -ADDITIONS, ETC.—For alterations and additions to Ebenezer Independent Chapel, Abercrch, near Pwllheli. Plans, specifications, and general conditions at Brynynys, Abercrch. Secretary, Mr. J. Owen, Brynynys.

MAY 23. — **Cwmgwrach.** — ADDITIONS. — For alterations and additions at shop adjoining Cefn Gelli cottages, Cwmgwrach. Drawings and specifications with Mr. J. Llewellin Smith, M.S.A., Aberdare.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary or artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and reports read at meetings rests, of course, with the writers.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

Any drawings sent to or left at this office for consideration should bear the owner's name and address either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

No communication to a contributor to write an article, or to execute or lend a drawing for publication, is given but to the approval of the article or drawing, when offered, by the Editor, who retains the right to reject on unsatisfactory. The receipt by the author of a price of an article in type does not necessarily imply its acceptance.

The Illustrations of the First Premiated Design in important architectural competition will always be selected for publication by the Editor, whether they have been formally asked for or not.

All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

Six lines or under ..... 6s. 0d.
Each additional line ..... 1s. 0d.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 9d.

Terms for series of Trade advertisements, and for front page and other special positions, on application to the Publisher.

SITUATIONS WANTED (Single-handed—Labour only).

Four lines (about thirty words) or under..... 2s. 6d.
Each additional line (about ten words)..... 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps *must not* be sent; but all sums should be remitted by Postal Orders, payable to J. MORGAN, and addressed to the Publisher of "THE BUILDER," 4, Catherine Street, W.C.

Advertisements for the current week's issue are received up to ONE p.m. on THURSDAY, but Classification is impossible in the case of any which may reach the Office after TWELVE NOON on that day. Those intended for the Outside Wrapper should be in by TWELVE NOON on WEDNESDAY.

ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same must reach the Office before TEN o'clock on WEDNESDAY MORNING.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, etc., left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

ADVERTISERS in "THE BUILDER" may have *Replies addressed to the Office*, 4, Catharine Street, Strand, W.C., *free of charge*. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage. Unused stamps are returned to advertisers the week after publication.

N.B. The Reply Boxes are not intended for trade lists, circulars, and the like, should these be received, they cannot (if noticed) be forwarded.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES { NINEPENCE EACH. (By post carefully packed), 1s.

PRICES CURRENT OF MATERIALS.

*** Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

A MESSAGE FROM AMERICA.

It is not often that we have the pleasure of listening to a paper which conveys the sensation of personal vitality to such an extent as that read by Mr. R. A. Cram at the Royal Institute of British Architects on Monday night. Mr. Cram holds strong opinions, and is not afraid of expressing them, and, whether we are inclined to agree or not, definite opinions clearly expressed have always an invigorating influence.

To borrow a much misused term, we may describe the meeting as a "Revivalist" one, and indeed it was this in two senses. Both the revival of the older ideals in education and the revival of the traditional forms of architecture as expressing and enhancing these ideals came under review. In regard to the first of these, Mr. Cram insisted firmly on the value of educational methods building up character as against those aiming primarily at imparting highly specialised knowledge.

In his view personality comes first and efficiency second. Doubtless the firm hold that this view is establishing for itself in the United States has only been secured by intense activity in its supporters, and we get hints of the stress of the battle when Mr. Cram slips into his Crusader mood.

With regard to the architectural question, we cannot feel so sure that the right lead is being given. If America is as our brilliant *confrère* pictures it, it is once more fighting over the old ground made historic by the labours of Pugin and Ruskin, and we could almost feel that we were transported back to those early Victorian days when the battle of the styles exercised such an exciting influence on architectural discussions. Is this the America of to-day? We confess we can hardly credit it. If not, though, how comes it that we see on the screen before us an amount of work—and so much of it really fine work—that almost enforces the imagination to believe in the domination of the British tradition in contemporary American architecture? The truth is that America is vastly bigger and vastly more active than the untravelled Briton can easily realise, and that the selection of even a single phase of its activity suffices for the moment to throw the others into the background.

Mr. Cram and his fellow-workers would, if we concentrated our attention on them alone, give us the firm conviction of an absolute unity of architectural ideals in Britain and the United States of America; but, desirable as such a consummation may be, we do not think that it may yet be regarded as having actually taken place. The influence of the Beaux-Arts

in the States predominates architectural design there to a far greater extent than Mr. Cram would like us to believe. For our part, we feel this influence to be beneficial, and as architecture on both sides of the Atlantic draws closer together we do not think that the logical element as represented by the methods of the Beaux-Arts will drop out in favour of the romanticism so attractively advocated by Mr. Cram and those who sympathise with him.

The future looms but vaguely before us; an ultimate harmonising of all the conflicting ideals of our own day is suggested, but the discovery of the means by which this will be effected is beyond our powers of philosophic deduction. The arts are not amenable to such methods of investigation, and the artist can only follow the highest light that is in him, leaving to fate the ultimate outcome of his efforts.

PAINTINGS AT THE ROYAL ACADEMY.

WE are so accustomed to be told year after year by those whose business it is to tell us that the Academy Exhibition is worse than usual that at least we cease to be alarmed. The country, as we all know, has been going to the dogs from time immemorial. The truth is, probably, that any exhibition arranged on these lines is bound to be somewhat tiresome and provocative of headaches at the best of times. In any year's output—when so many mediocrities are encouraged to produce paintings—the works of actual distinction must, we suppose, be relatively few, although no doubt they vary in number from year to year. Their effect on the general tone of the exhibition, or even their discovery by the critics, must depend to a great extent on their arrangement by the hanging committee, and that it is generally understood depends a great deal too much on circumstances which have no relation to the intrinsic merits of the works. If, however, an exhibition should—like an artist—be judged by its best works, this year can hold its own. Mr. Sargent's works are as amazing as ever. Not great pictures, perhaps, in every sense of the word, but achievements which in their way are unapproachable. Mr. Arnesby Brown's "Norfolk Landscape," which has been acclaimed as the picture of the year, certainly shows no falling away from previous standards; although we cannot help wondering whether human figures instead of cattle in the foreground would not have struck a higher note. But such works as these, or the pictures by Mr. Charles Sims, Professor George Clausen, and others, would give interest and distinction to any exhibition.

Although the usual crowd of uninteresting portraits of uninteresting people is relieved here and there by such distinguished works as Mr. George Henry's portrait of Leonard B. Schlesinger, Esq., we are none the less grateful to Mr. G. Spencer Watson for his two picture-portraits, with their fine colour schemes and rich decorative treatment—the more perhaps that decorative work is not well represented this year.

Mr. John Crealoch certainly has two pictures called "The Red Sofa" and "The Yellow Sofa," in which the evident intention is to design a pattern, and there are other pictures in which the same feature is present; but the only piece of pure decoration that we noticed is "The Bathers," contributed by Professor Gerald Moira. This is an interesting composition, treated in a light key of colour, but it is hung too high to be properly appreciated, and is so out of harmony with its surroundings as to suggest that a room should be set apart for such work, when no doubt enough would be forthcoming to fill it. It really does seem a pity that decorative works are treated in this way, and that definite steps are not taken to afford more encouragement to this important branch of painting.

Architecture as the subject-matter for pictures is well in evidence. There are the usual number of views of Della Salute, St. Mark's, and other Venetian scenes. In the Water-Colour Room we notice the Mosque of Abou l'Agag at Luxor and the leaning column at Karnak, by Mr. R. Phené Spiers; the Roman Theatre at Timgad, by Sir Ernest George; the Market Place, Taormina, a vigorous sketch by Sir Alfred East; and a careful and sympathetic study of the entrance to the Temple, Medinet Habu, Egypt, by Mr. Lancelot Crane.

Mr. H. E. Tidmarsh sends two panoramic views of London, one from the Tower Bridge looking west and the other from St. Mary-le-Strand looking east. They are carried out in a most thorough and painstaking way, and, whatever their artistic merits may be, they should certainly have much topographical and historical interest. An interesting piece of architecture in Gallery IX., the Yee Fung Mun Gate, Nanking, by Mr. Montagu Smyth, should not be overlooked.

Of the numerous examples of the interiors of buildings, with or without figures, probably the most notable is a Kensington Interior, by Mr. Frank L. Emanuel, a delightful rendering of a delightful subject.

It is inevitable, perhaps, that so much of the wall space should be taken up by "command" pictures relating to the Coronation. Mr. Bacon's picture of the ceremony in Westminster Abbey may be a success from the point of view from which it was commissioned, but somehow it entirely fails to give the atmosphere and general effect of the Abbey interior, which, after all, in a work of this historical interest is a matter of some importance.

NOTES.

Tattershall Castle. THROUGH the public-spirited action of Lord Curzon and his friends the lamentable incident of Tattershall Castle has at last been brought to a satisfactory conclusion. Lord Curzon, who bought the castle after its mantelpieces had been removed, has now recovered them, and after their reinstatement intends to throw the Castle open to the public. It is to be hoped that the feeling aroused over this matter will strengthen the hands of the Government and tend to convince them that there is a very large and influenti body of opinion in this country su porting their proposals for the protecti of ancient monuments, and that th may venture to go a step or two furth in the direction of stringency than th have hitherto intended. Except for t damage which must have been inflict on the mantelpieces by their remov we suppose that no harm has been do in this case, but we cannot always re upon a Lord Curzon to step in and sa the country from the results of its ow lack of interest and good management.

Competition Publicity. IT will be remember that on April 19 v published a letter fro Mr. C. H. B. Quennell advocating t exhibition of the Port of London Co petition Preliminary Designs; also "Note" upon it, in which we express our willingness to do what we could to gi effect to this suggestion in our column This week we print a letter from Mess A. E. Maxwell and C. Orlando Law support of what we gather from these a other sources to be a general consens of opinion upon the matter. From ma points of view, greater publicity in co petitions which go through two stag is desirable. There is the educati aspect, upon which we laid stress. cannot be overrated. And there is t whole group of reasons for publici which operate in all competitions in t final stage, and make it a matter of cour that all the designs may be seen at lea by the competitors. These consider tions are directed, of course, chiefly the maintenance of that fair field and favour upon which we pride ourselv in our public competitions. To this e alone, if to no others, all the desig should be seen at least by the co petitors; and if it cannot be arrange officially it had better be done as best can by other agency.

Assessing the Assessor. THAT aspect of the matte of course, is relevant t the personal honour the assessor, and in this country ther is, in our larger competitions at any rat little need of vigilance in that direction though it should not be neglected Professional integrity can seldom b questioned. But what may be criticised what in conversation among architects i criticised, more outspokenly than in th Press, and what should be criticised i the Press more searchingly than persona considerations perhaps seem to permit is not the honour but the intelligenc of the gentlemen concerned. As w look over successive groups of the three o four premiated designs in competitio after competition we find ourselve wondering again and again whether th assessor in each case had in his mind an conception of what was the right an what consequently was the wrong thin to do in the given case. For the design chosen seem to be the embodiment o no one principle, right or wrong, but t represent severally the various group of possible solutions. If one design o those chosen is the best of them that wen for the right method, all the others must b attempts to go for a wrong one. The may be very creditable in themselves but they do not on that account deserv

place. If the assessor in each case really had some guiding principle firmly in his mind, all the premiated designs would be variations of the same solution of the problem in hand. Too often, however, we are forced to the conclusion that the assessor acted from the empirical standpoint—that fatal attitude which in varying degrees so vitiates all our efforts to-day.

Nationalisation of Railways.

THIS subject is continually cropping up, and is one in which the trader has a double interest as compared with the mere passenger or the man in the street. There has been much wild and unreasoning talk about it, and the attitude of Mr. Asquith, at his meeting with the Parliamentary Committee of the Trades Union Congress on Monday, is worthy of notice. The deputation had alluded to the advantage the railway companies are beginning to derive from their efforts to eliminate undue competition; rather unfairly belittling the many voluntary increases of the wages bill by which these advantages were shared by their employees. "The notion," remarked Mr. Asquith, "that you can reduce fares and rates, shorten hours of labour, and raise wages by paying, for the total capital value of the undertaking, a very small number of years' purchase is, I think, an illusory notion." The Prime Minister frankly stated that he did not think the burden of proof—which he places on those who are in favour of the nationalisation of railways —has been satisfied. "The State keeps a tight grip over the railways," he reminded them. Railway managers will feelingly endorse this, and perhaps it is better so than if the State had the sole control and direction of the railways.

Regent's Quadrant Competition.

THE response to our invitation to architects to design a façade for the Regent's Quadrant shows that the subject has attracted many members of the profession with established reputations. We have thought it desirable, therefore, to strengthen the Jury of Assessors by the addition of Mr. William Flockhart, F.R.I.B.A., who has expressed his willingness to co-operate with Mr. Rickards and Mr. Munby. The wide experience of Mr. Flockhart in important street architecture will be well known to competitors, and his presence on the jury will doubtless be appreciated.

MARCONI HOUSE, STRAND.

The premises until recently occupied as the Gaiety Restaurant have been speedily converted for purposes of the Marconi Wireless Telegraph Company. The ground-floor bar is altered into the telegraph office, the old ballroom into the accountant's department; the main restaurant, on the ground level, is modified to accommodate the transfer branch. A wireless installation will be erected upon the roof. The restaurant (upon a site of 10,500 sq. ft.) and the adjoining theatre and Messrs. Short's premises were erected from the plans of Messrs. Ernest Runtz & Ford, the design of the elevation being based upon a sketch design made by Mr. R. Norman Shaw, R.A. The structural alterations throughout the building have been made by Messrs. Trollope & Colls, under the superintendence of Messrs. Dunn & Watson, the electrical light installation being by Messrs. F. Geere Howard, and the telephones and fire-alarms by Messrs. W. G. Hodgson & Co. The Masonic Hall (now the board-room) was decorated by Mr. W. J. Neatby.

THE usual fortnightly meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Mr. Leonard Stokes (President) in the chair.

Mr. H. T. Hare announced the decease of Mr. Peter Kerr, the well-known Melbourne architect, who was for many years a Fellow of the Institute, but resigned a few years ago on retiring from practice; also of Mr. Henry Shackleton, Associate, elected 1906, and Mr. Ernest Theodore Felgate, Licentiate.

Mr. R. A. Cram then read an interesting paper on

RECENT UNIVERSITY ARCHITECTURE IN THE UNITED STATES.

In the course of his remarks Mr. Cram said:—"The foundations of sane and sound and wholesome society are neither industrial supremacy, nor world-wide trade, nor hoarded wealth; they are personal honour, clean living, fearlessness in action, self-reliance, generosity of impulse, good-fellowship, obedience to law, reverence, and the fear of God—all these elements which are implied in the word "Character," which is the end of education and which is the proudest product of the old English residential college, and the old English educational idea that brought it into being, maintained it for centuries, and holds it now a bulwark against the tides of anarchy and materialism that threaten the very endurance of civilisation itself.

From time to time we have yielded more or less to novel impulses, coquetting with that questionable lady sometimes known as the Spirit of the Age, accepting even her insidious doctrine that, after all, the object of education is not the building of character, but the breeding of intensive specialists, or the turning of a boy at the earliest possible moment into a wage-earning animal. When we stop doing things long enough to think, we all realise that, as the Dean of St. Paul's has recently said, "The real test of progress is the kind of people that a country turns out," and the product of secularised and intensive education is not of a quality that develops a sense either of covetousness or emulation in sane and healthy minds.

We are returning, step by step, to the old ideals and sound methods of English colleges, returning to the mother that bore us, just as we return year after year to our old home for refreshment and inspiration; return even in a wider sense to those eternally battered but eternally enduring principles in life and thought and aspiration which make up the great Anglo-Saxon heritage of which we proudly claim to be joint heirs with yourselves. And in this return we find ourselves recurring once more to the very forms of the architecture—or rather, we hope, to its underlying spirit—through which this great tradition has manifested itself.

In America practically all the XVIIth-century work and nine-tenths of that of the XVIIIth is gone, including much of the best, and we

Washington University, St. Louis, Mo.
Messrs. Cope & Stewardson, Architects.

must recreate our vision of the past from shreds and patches, but fortunately at Harvard there remains a notable group that has yielded neither to vandalism nor conflagration.

The first evidence of decadence appears, I think, in the advent of that more pompous style Jefferson did so much to advance. Hitherto what had been done was done simply and unaffectedly; now came the conscious desire for architecture, which is a dangerous ambition at best. At the University of Virginia we have the original setting out, almost intact, and if we deplore the unnecessarily unreasonable classical porticoes with columns, entablatures, and pediments complete—and all built of pine boards framed up in the semblance of a newly-discovered paganism—we must admit the great dignity of the plan and the singular charm of the ensemble.

This "Jeffersonian" style rapidly took the place of the old Georgian, but its day was brief, and somewhere between 1820 and 1830 occurred that ominous point when the last flickering tradition of good taste and the last weak impulse of instinctive art vanished.

Fortunately there was little collegiate building with us during this dismal second quarter of the XIXth century, or, rather, and also fortunately, little of it has survived, and when first the architect appears on the scene as the mentor rather than the exemplar of public opinion it is in novel guise; nothing less, indeed, than as the protagonist of Gothic. He was not very Gothic, I must admit, and in the beginning he contented himself with a few apologetic and quite casual buttresses, pointed arches over his door and window openings, an octagonal turret or two, and, of course, battlements, usually of 2-in. deal neatly painted, and sometimes sprinkled with sand as a concession to appearances.

It was all a "false dawn," however, and ceased almost in a moment (though for a brief period only, as we shall see) when that great genius and greater personality, Richardson, flashed like an unpredicted comet across the sky. He did great work, some of it immortal work, in his powerful mode, but he died before his mission was accomplished, and though he killed the "French roof style" and the futile Gothic, and all the other absurdities, he left behind no one of his own calibre to carry on the crusade.

It may be well to examine a typical American University, in its setting out, in its component parts, and in its organisation. I will choose for this purpose Princeton, of which I am a member by adoption, and where I have the honour to act as Supervising Architect. The title itself will indicate at once one of the many points of divergence between the English and American systems, for I fancy there is no University in the United Kingdom where one man is given almost complete authority over all matters of the choice of architects, supervision of their work both in design and execution, acceptance or rejection of gifts, and their placing if accepted, the development of roads and paths, and the planting of trees and shrubs. Until recently such an office was unknown in America, but since Princeton took the lead some five or six years ago others have followed rapidly, and the practice has now become an established custom.

It was time, too, that something should be done; as I have already indicated, our colleges are like Topsy, they "just growed," without rhyme or reason, subject to the most vacillating fashion and the quaint whims of emancipated individuals, and the results were generally shocking. At Princeton this growth had been quite lawless, and conditions were even worse at Harvard and Yale. The wide spacing and the lack of co-ordination marks another point of difference; with us almost every college has begun in open country, as an original foundation. We have nothing like Oxford and Cambridge, partly because of this fact, and partly because each college is with us a unit; we have no gathering together of many and independent foundations, loosely knit together for administrative purposes; we have, instead, self-contained units, sometimes of enormous size, and each new benefactor founds not a new college, but a dormitory, a library, a school of law or medicine or forestry or—journalism.

University of Pennsylvania, Philadelphia: Terrace Dormitories.

Messrs. Cope & Stewardson, Architects.

Personally, I think this plan must be abandoned, and a breaking up into more manageable units take place. In the new plan of Princeton the tendency is towards the standard type; here the dormitories are assuming quadrangular form, and in time may become full residential colleges, each with its common-room and great hall, and, when times have still further changed, its chapel.

Another thing that will strike you is the magnificence of our gymnasiums and the dominating quality of our schools of science. Then we have general physical directors, as well as special trainers for the varied forms of athletics, and in many colleges regular and searching examinations of the men for physical and functional weaknesses, and as a result the health of our schools is well above normal. As for our science buildings, you know, as we know, only too well, how almost unbalanced we have become in our devotion to practical and "vocational" training, and how obsessed we have become with the mania for natural science. Here at Princeton there is less of this than elsewhere, but two of our newest and most magnificent buildings are devoted, the one to biology, the other to physics, though as yet we have no schools of mechanical and electrical and mining engineering, as happens so often elsewhere.

One novelty you will not notice at Princeton, and that is the clubs and fraternities. We have as many "Greek Letter Societies" (which are very awful and very secret organisations) as we have colleges, and there are some institutions in America where these fraternity houses almost outnumber the academic buildings themselves. At Princeton no Greek Letter Societies are allowed, but there are two old secret organisations, the Whig and the Clio, whose white marble mausoleums form the very centre of the campus, while to the east stretches a great street absolutely lined with the private clubs which grew up when the fraternities were taboo. These clubs take in only a certain number of new members each year, they are distinctly aristocratic in their tone, though aristocratic of a sound and healthy type, and they generally follow the lines of an old and palatial country house.

From all these points of difference you will see then that our American University is a very different matter in its architectural form to those in this country. Our newest Graduate Colleges come nearer, as the now rising buildings for Princeton testify.

In the meantime let us examine the beginnings of what has been a notable Gothic Renaissance amongst our colleges. Cope and Stewardson's work at Princeton set the pace, however, and so beautiful was it, so convincing as to the possibilities of adapting this perfect style to all modern scholastic requirements, the University authorities, with a wisdom beyond their generation, passed a law that for the future every building erected at Princeton should follow the same general style.

Columbia University in New York—the old King's College of Colonial days—stands, of course, as the noblest type of the pure classical idea, and its majestical Library will always remain a national monument. Unfortunately,

Chapel: U.S. Military Academy, West Point, New York.

the site is crowded and fatally restricted; the mistake was made of fixing this—when the change was necessary a generation ago—too near the outposts of the advancing city, which, like a conquering army, has already swept up to its gates and miles beyond.

There is little else that is purely classical amongst our Universities, though Carrère & Hastings have built a most engagingly Parisian Alumnæ Hall at Yale, the Naval Academy at Annapolis is strictly French, and the University of California is growing on scrupulously Beaux-Arts lines afar on the Pacific Coast. Harvard is conscientiously following the Georgian manner, and so is Williams, where we ourselves are trying to show we have no hard feelings by building a Commencement Hall, and a new quadrangle, in this quite characteristically American style. Georgian also, with rather quaint Roman elements, has been used by McKim, Mead, & White for the vast War College at Washington, and altogether it is, as we say in our colloquial way, giving Gothic "a run for its money."

The University of Pennsylvania shows still more of Cope & Stewardson's wonderful work, though here it is couched in an extremely rich Elizabethan vernacular. Bryn Mawr is built of the wonderful stone that underlies all Pennsylvania and New Jersey, putting a premium on good architecture. Here in England all building stone is finely dressed, but in America we have adopted the practice of using "ledge stone" for our ashlar, our trimmings only being tooled. Fortunately, we have a wide variety of singularly beautiful stones, ranging in colour through all shades of grey, brown, purple, and tawny, easily obtained, inexpensive, and durable. In a way, I think we gain a richness in colour and texture that is obtainable in no other way, while we also acquire something of that effect of age, which is, after all, so essential a part of architecture.

Good Gothic is encroaching steadily on the preserves of Classicist, Boulevardier, and Colonial, and this in spite of the fact that, with the single exception of Harvard, every one of our schools of architecture absolutely disregards every type and phase of Gothic, both in design and in theory. Of course, it can't quite be suppressed in history and archæology, but it is treated rather as the madcap escapade of a callow youth, and passed over as lightly as possible. In spite of this, architects do appear

who love Gothic, and what is more, know about it also. Religion clamours for it, education annexes it, and at West Point the Government of the United States itself accepted it with alacrity, and has found it not half as bad as it looked. I cannot begin to give you any idea of the extravagant beauty of the site of West Point. It is like the loveliest part of the Rhine, only bolder and more dramatic. Mountains rise from the river on either hand, deeply forested —Storm-King and Dunderberg lifting highest of all—and on a narrow plateau, 150 ft. above the river, stands the Academy, its buildings forming a rampart along the cliff, and creeping up the mountain sides all around. Of course, there wasn't anything one could do there except Gothic—of sorts—though others had thought differently, as one who built there a lovely pagan fane like a dream of Imperial Rome. Moreover, most of the old work was pseudo-Gothic, and it had made a tradition, so it was not startling, after all, that our classical Government should have endorsed a Gothic school.

I am not sure they got it. I think the chapel on its crag, dominating the whole group, would pass, though it surely is not archæological; the site is compelling, however, and really what we tried to do was to translate the rocks and trees and ribbed cliffs into architectural form. Just what the cavalry and artillery buildings may be I don't know, nor does it much matter; they are an attempt to express outwardly their function, and in the simplest terms; the stables sweep in an enormous arc around one side of the cavalry plain, and at the back, against the towering hills, are the barracks, one for each branch of the service. The riding-hall is no more architecturally than a rampart of rock, heavily buttressed, and 300 ft. in length.

I think of the finished buildings the post headquarters is not the least interesting. It is built on the edge of the cliff, and the entrance by the base gate is four stories below the main court, which is entered from the upper level. It is a pretty big building, but it is wholly occupied by the administration of the Academy. Not only the buildings at West Point, but practically all the other works I have shown you as well, are all real masonry; no steel frame skeleton clothed indifferently with a veneering of masonry. We do, indeed, indulge in skeleton construction, and reinforced concrete and other structural expedients and substitutes, but deep in our racial consciousness, as in that of all other Anglo-Saxon peoples, is the solid conviction that, after all, there are but three real things in the world—the home, the school, and the church—and that when we are dealing with eternal verities honest and enduring construction alone admissible. And it is to the same consciousness I think that we may attribute the very universal return to Gothic of some form for our churches and our colleges and our schools. We have not hammered out our own intimate style, or national and contemporary architecture, any more than have any other modern races and peoples, but this will come by-and-by. At present we architects are, I conceive, no longer as in the past the mouthpiece of a people, creating the visible form for a great dominating social impulse that is the mark of supreme civilisation; rather are we the voices crying in the wilderness, the pioneers of the vanguard of the new life, the men who recreate from antiquity the beauty that is primarily educational, that so it may work subtly through the consciousness of those who come under its influence, slowly building up a new civilisation that, when it has come full side, will burst the shell of archæological forms, and come forth in its new and significant and splendid shape.

We have not now, nor have had for three centuries, a civilisation that demanded or could create such artistic expression, but the light is already on the edges of the high hills, and we know that a new dawn is at hand. In the meantime, like the monks in the dim monasteries of the Dark Ages, we cherish and preserve all that was great in our greatest past, building as well as we may new Oxfords and new Westminster Abbeys, new Lincolns, new Richmond Castles, new Haddon Halls, not as the last new word in architectural expression, but as schoolmasters and as prophets, content with the educational work we are accomplishing, leaving to our successors the equal but not more honourable task of voicing in novel and adequate form the new civilisation we are helping to create."

Mr. E. Warren

said it was always a pleasure to meet an architect who came from a friendly country to instruct them, and as in this instance when a gentleman came from America, which he refused to regard as foreign, the pleasure was doubled. He presumed that he was honoured by being asked to propose a vote of thanks to the author, because a little while ago he tried to interest them in the evolution and development of collegiate architecture in England. It seemed a far cry from the old brown buildings of Oxford and Cambridge to the new examples scintillating under the American light which Mr. Cram had shown them, and at first they felt a little bit bewildered by the flights of fancy in a scholastic direction which they had seen; but it was with a certain sense of "titivation" to their insular pride and satisfaction that they had seen the English idea of the quadrangle and the sense of antiquity predominating in these examples. They congratulated Mr. Cram on a brilliant and interesting paper and on the treatment of magnificent opportunities. Anything more superb than the site he had had to deal with at West Point it would be difficult to imagine, and they congratulated Mr. Cram on the way he had handled that opportunity. But the opportunity did not make the man; it was the man who made the opportunity. Mr. Cram would not mind if he said that cherishing the ancient things they possessed in this country they were interested to observe a reflex of the various forms so familiar to them in the unaccustomed surroundings and light of America. He had never had the opportunity of making acquaintance with these buildings except by seeing photographs and by hearsay, and at such a late hour he would confine himself to merely proposing the vote of thanks.

Sir Aston Webb,

in seconding the motion, said it was impossible to exaggerate the debt they owed to Mr. Cram for coming to England and bringing such a splendid enthusiasm and showing them what they were doing in the way of building Universities in the United States. He endorsed what Mr. Warren had said as to the splendid way in which Mr. Cram had dealt with the opportunities he had had. They were all immensely struck with his magnificent building at West Point. The author had brought with him a certain amount of Gothic enthusiasm which reminded some of them of many years ago when they were Gothic enthusiasts themselves. He was not sure that he was not so still. It made them still feel young. At the same time, they had tried to think that "styles" did not matter, and that "style" was the only thing which did matter, and one was inclined to think with Ruskin when he said that it did not matter whether a man took three months to paint a single petal of a flower or whether he covered a palace front with colour in a single day so long as he did it with sincerity and whole-heartedness. One was inclined to think perhaps with regard to these University buildings that the style did not matter so much as long as the man who built them did so with sincerity and wholeheartedness and with the enthusiasm which Mr. Cram had and thought they should all have. Oxford and Cambridge were full of other things than Gothic. Perhaps there was more "other" than Gothic, but the whole effect was satisfying. They would ask Mr. Cram to take over to America their best wishes and their belief that when these Universities had been touched by the hand of time they would vie with those of this country.

The Chairman,

in putting the vote of thanks, said he would like to add a personal word of thanks. He had recently been to the States, and the kindness which was heaped upon him was almost overwhelming. He went more or less as their President, and, at any rate, their colleagues in America would not let him go anywhere except as President of the Royal Institute of British Architects. They showered honours on him as the representative of the Institute, and he would like the members to show how much they appreciated the kindness shown to him as their representative in a semi-official capacity. He had had the advantage of seeing some of the buildings which had been reproduced on the screen, and particularly those at West Point, but he felt that the photographs did not adequately represent either the beauties of the site or of the buildings. The situation at West Point was superb and the buildings added to the natural beauty. Mr. Cram had been somewhat hampered by the buildings already existing, some of which were good and others not so good; but the work his firm had done was really splendid, and they were bringing the whole composition together in a magnificent way.

The motion having been carried,

Mr. Cram

said he was unable to express either his appreciation of the privilege they had granted him in asking him to come and talk about some of the work they were doing in America or his even deeper appreciation of the unfailing kindness and consideration which had been shown his compatriots and himself whenever any of them were fortunate to be able to cross the Atlantic, which, after all, was a mere geographical expression separating two peoples who were essentially in all their principles of the past, the present, and the future absolutely one people.

The President announced that the next meeting would be an extra one on June 3, when Mr. W. Woodward would read a paper on "The Newer Responsibilities of Architects."

THE BOARD OF ARCHITECTURAL EDUCATION.

The Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students, who are qualifying for the Final Examination, have been approved :—

Subject I. (*a*)—A large Monument to Commemorate King Alfred's Refounding of London: Messrs. H. A. Dod, Hal Harper, Ernest Prestwich, and H. C. Bradshaw.

Subject I. (*b*)—A Terrace of Five Houses: Messrs. R. F. Dodd, Walter E. Woodin, S. Stevenson Jones, and W. Harding Thompson.

Subject II. (*a*)—A large Monument to an Explorer: Messrs. H. Lidbetter, R. S. Dixon, F. O. Laurence, F. A. Broadhead, R. Duckett, E. F. Bothwell, C. M. McLachlan, W. E. Woodin, R. A. Barber, and J. O. Cheadle.

Subject II. (*b*)—A Cloister with External Entrance Gateway or Tower to a Collegiate Building: Messrs. H. A. Dod, H. C. Bradshaw, and E. Prestwich.

THE OLD GENERAL POST OFFICE:

A NEW SUGGESTION.

By Wilmot Corfield.

It comes as a shock to Londoners to learn, through Mr. W. W. Benn, representing the First Commissioner of Works, that the old General Post Office buildings in Aldersgate-street are doomed to early demolition, and that, according to his announcement made recently in the House of Commons, a contract for clearing the site is now under consideration. The *Daily Telegraph* of the 9th inst. (the day that it published this statement) contained also a well-reasoned appeal for the establishment in London of a public postal and philatelic museum on the lines of those already existing in Berlin, Stockholm, and Washington. This appeal was made in the course of a lengthy reference to the annual National Philatelic Congress, recently held at Margate, where the suggestion was made in the course of an address by the present writer for the adaptation of the old Post Office buildings, the historic pile in St. Martin's-le-Grand, so as to serve as the home for the museum, and also, if the terms of the late Mr. Tapling's will permitted it, of the national stamp collection.

In the muniment-room at the General Post Office there already exists the nucleus for a postal museum of unique interest; in the King's Library at Bloomsbury a priceless philatelic collection, the finest in the world. The muniment-room is a *terra incognita* to the general public, the truncated stamp collection is derelict and lifeless. And now the very building of all others which circumstances point to as the ideal one for museum and collection alike is about to pass into the hands of the house-breaker.

The official reason given for the destruction of the St. Martin's-le-Grand edifice is its "prodigality of space." A "new block" is to be erected, and a blow dealt to the architectural charm of the City to be regretted not only by us, but, when we of to-day are gone, by all future historians and students of prints and

other pictures. We know these "new blocks," earth-devouring and stupendous, but lacking in soul, devoid of inspiration, masses of masonry deadening to civic pride in the external aspect of London's thoroughfares.

Both historically and architecturally the old Post Office is worthy of preservation. Its fine halls, its lofty, well-lighted corridors, its generous and gracious air of high ideals and restrained but imposing effect in the massive and cultured design of its main façade are scarcely of the sort which a city and country should willingly consign to oblivion.

The museum must arrive. Its nucleus already occupies much of the cubic space of some "block" somewhere or other to which Londoners have no access. It is actually intended to destroy the ideally spacious in order to erect the cleverly cramped, and then to pour out libations to the Goddess of Economy, while encircling her brows with bays representative of unpoetical utility.

The Guildhall, the Mansion House, and the Bank are left. But Old Newgate is down, Christ's Hospital gone, and now Smirke's Post Office is under sentence of demolition. It was begun in 1824, superseding a previous building used for postal purposes off Lombard-street at the King William-street end, of which nothing remains, which had been the official headquarters of what system existed since the fire of 1666.

The long and splendid tale of the rise and development of the Post Office may not, however, be recapitulated in these pages, and this note of urgent appeal is now sounded in the hope that before it is too late the heavy hand of the destroyer may not descend upon what should be, and might be, the recognised gathering centre for all relics and records of unique interest historically bearing upon the progress of that great department that has so strikingly and pre-eminently made for the betterment of both our domestic and international relations and for the commerce and peace of the world.

ARCHITECTURAL ASSISTANTS OF THE OFFICE OF WORKS.

MR. PHILIP SNOWDEN had no fewer than five questions down on the paper in the House of Commons on Monday night with reference to the Architectural Assistants of the Office of Works. They were all addressed to Mr. Wedgwood Benn, as the representative of the First Commissioner of Works. The first was as to whether it is his intention to see that the desires of all of the class termed Architectural Assistants should be ascertained with a view to placing them upon the established list; and to this Mr. Benn referred the Hon. Member to the reply given on May 6, and which was published in the *Builder* of May 10.

Mr. Snowden then asked whether he is aware that up to and including the year 1903 the class termed Architectural Assistants, formerly Senior Draughtsmen, engaged in his department, performed all the professional duties, and with the ability now expected, of the Assistant Architects, consisting of the charge of one or more contracts, with the preparation of all the design and construction plans directly under the architects; or if he would say what class did perform these duties at this period, seeing that the total number of the class termed Assistant Architects numbered only eight, who were engaged in nearly every instance upon official routine, and that the amount of the architectural work in the department was within 80 per cent. of the total amount at present, but that the total number now is forty-six; whether he is prepared to aver that the professional abilities exhibited in the exercise of these duties by the Architectural Assistants were not equal to those exhibited now by the class termed Assistant Architects; and will he say why since that period numbers of Junior Draughtsmen have been established to take over these duties formerly satisfactorily performed, thus causing grave dissatisfaction to the Architectural Assistants.

Mr. Benn replied that the answer to the first part of the question is in the negative. In reply to the second part, there were thirty-one Assistant Architects in 1903, and now there are forty-nine. Of temporary men there were about 120 in 1903 and now about 216. As regards the third point, the Architectural Assistants have in the majority of cases had the opportunity of competing for permanent posts and have either not availed themselves of it or have failed. With respect to the last point, the establishment has since 1902 been recruited by competitive examination of members of the unestablished staff.

Mr. Snowden's third question was whether Mr. Benn was aware that the titles of the two classes engaged in his department, Architectural Assistants and Assistant Architects, are upon professional grounds one and the same; that the professional diplomas held by both classes are equally distributed, the number of Associates and Licentiates of the Royal Institute of British Architects in the Architectural Assistants class being twenty out of a total of fifty, and that of the Assistant Architect class eighteen out of a total of forty-six; whether he is aware that the services rendered by both these classes are one and the same; and that both these classes are equally certificated, the one class holding the technical certificate of the Commissioners of the Board of Works and the other class that of the Commissioners of the Civil Service; and will he therefore see that the Civil Service rule of equal reward for equal class conditions is in this case observed by establishment and remuneration.

Mr. Benn answered that there are nineteen Associates of the Royal Institute of British Architects among the Assistant Architects and eleven amongst the Architectural Assistants. There are also two Licentiates among the former and twelve among the latter. The Associates and Licentiates were not, of course, upon the same footing. The answer to the third question was in the negative, and to the fourth that the two certificates are not in any way equivalent.

Mr. Snowden inquired if the necessary steps will be taken to prevent the present established architects' staff, termed Assistant Architects, from being increased by the present method by members of the junior unestablished staff, termed Draughtsmen, by examination or otherwise, until the services of every member of the present certificated senior unestablished staff, termed Architectural Assistants, has been fully utilised by establishment and remuneration as those in a similar professional position, classed as Assistant Architects.

To this Mr. Benn regretted that he was unable to give such an undertaking.

Finally, Mr. Snowden asked whether he is aware that the designs and the necessary constructive documents constituting the basis of the building contracts formerly in the sole charge of the class termed Architectural Assistants directly under the chief of the branch is being now taken from them, thus reducing their positions to a subordinate one, and handed over to a class junior to them in age and service, and termed Assistant Architects of the second class; that the resulting friction occasioned by this action is hampering the progress of the work of the department; and will he give instructions that the original express conditions of service in this and other respects of the Architectural Assistants be reverted to.

Mr. Benn said that the question of work has rendered necessary the increase of the permanent staff in order to relieve the architects by devolving a certain amount of the work on the Assistant Architects. No instance of friction hampering the progress of the work of the department has been brought to the notice of the First Commissioner and no instructions are needed for any change in the current procedure.

THE ARCHITECTURAL ASSOCIATION:

FIRST SUMMER VISIT.

PLEASANT conditions favoured the visit, on May 18, to Ottershaw Park, near Woking, a large house by Messrs. Niven & Wigglesworth, situated some twenty-five minutes' drive from Woking Station. The building occupies an old site surrounded by fine park lands and gardens, and so escapes that rawness usual in new creations. The evolution of the present building has followed a course not uncommon in the circumstances. First commenced as an addition of two wings to an existing house, it has ended by the sweeping away of the original building with the exception of a few basement offices and foundations, retaining, however, the general shape and disposition of its rooms, and expanding beyond the first-intended wings on either side as well as upward in the form of a mansard roof not originally intended. A knowledge of these facts of growth is necessary to a right appreciation and judgment of the architects' efforts and their result.

As now completed the house consists of a squarely-proportioned centre block of three stories and a mansard, wings to east and west of lesser height, and single-story extensions beyond these, that to the west being a winter garden and on the east a covered loggia for meals, open only to the south, and easily reached from the dining-room or service-room. The external treatment is a rather severe type of Renaissance, without an Order, emphasis coming from quoins and window-dressings. All the buildings are faced with Bath stone, and there is a freedom from tricks and affectations of detail; the house will gain in effect as it weathers.

The plan is a fine and dignified one and appears also to be excellently arranged for smooth working. Entering beneath a central *porte cochère* on the north front, a broad flight of internal steps conducts the visitor directly to the hall, which is centrally situated on the south front overlooking the terrace gardens. To right and left of the hall are the library and study, both pleasantly-proportioned rooms (about 30 ft. by 20 ft.), with well-studied lighting. A broad corridor on the long axis divides library and study from main and service stairs on either side of the entrance vestibule, and leads to the dining-room at the south-east (with loggia beyond), and the drawing-room at the south-west, parallel with the billiard-room facing northward, both these rooms communicating with the winter garden at a lower level by an ante-room and steps.

The kitchen and offices are on the lower ground floor, and are admirably spacious and well fitted. Beneath the south terrace is a large private swimming-bath, and there is extensive provision for heating and fuel storage.

The first floor has a well-devised plan. Above the hall is the boudoir, on either side of which, facing south, are the bedroom suites for members of the family, each with its bath-room and wardrobe-rooms, the remainder of this floor being devoted to guest-rooms, similarly provided; the upper floors contain further guest-rooms and accommodation for servants.

Excellent design and workmanship are shown in the interior finishings, the dining-room in particular being beautifully panelled in oak with some very fine carving in the Grinling Gibbons manner, and a fibrous plaster ceiling toned with gilding and scumble stain to a most harmonious effect. A fine vista is obtainable through the length of the house—some 190 ft.—terminating in the dining-room fireplace.

The troublesome necessity of external sun-blinds appears to have been very ingeniously solved by Mr. Niven, who was kind enough to attend with the plans and explain the problems and difficulties of the work, and both to him and to Mr. Eckstein for permitting this very instructive visit the members were much indebted.

ARCHITECTURAL SOCIETIES.

The Society of Architects.

The Easter Examinations were held on April 2, 3, and 4, in London, Manchester, Leeds, Cardiff, Birmingham, Oxford, and Dublin, the latter being a new centre. The Council have appointed Mr. A. Alban H. Scott, M.R.San.Inst., Examiner in Section IV., Sanitary Science, in the place of Mr. C. H. Mead, M.R.San.Inst., who has been compelled, owing to continued ill-health, to relinquish the duties. Mr. R. Willock, F.R.I.B.A., Examiner in Section IIIA., was prevented by a serious illness from completing his duties, which were undertaken by the Chairman of the Board of Examiners, Professor Henry Adams, M.Inst.C.E.

The following have satisfied the Examiners:—E. R. Bill, Shrewsbury; W. Bradley, Great Lever, Bolton; S. F. Evershed, Northampton; W. J. Hadley, Carmarthen; H. Lyons, Dublin; H. E. Matthews, Yeovil; D. J. Moss, Peckham Rye, S.E.; H. Phayre, Egremont; G. H. Russell, Hitchin; E. D. Sherlock, Fallowfield, Manchester; R. H. Syms, Isleworth; R. Thompson, Catshill, Bromsgrove; H. A. Wilkinson, Wood Green, N.

The following students of the Society have obtained Sectional Certificates:—Section I. (Architecture)—F. Clemes, Weston-super-Mare; C. Ford Reading; W. J. Isaac, Warrington;

A. B. Johnson, Croydon; P. Morris, Nelson. Section II. (Building)—W. J. Isaac, Warrington; W. E. Kelly, London; L. A. Reynolds, Hull; F. J. Taylor, London. Section III. (Practice)—H. Best, Whitworth; H. J. Lurcock, London; J. Slater, Blackburn; E. J. Williams, Leicester. Section IV. (Sanitation)—J. A. Grimshaw, Accrington; H. J. Lurcock, London; P. Morris, Nelson; C. F. Overy, Weston-super-Mare; J. E. Sanders, Liverpool; J. Slater, Blackburn; F. J. Taylor, London; E. J. Williams, Leicester.

Devon and Exeter Architectural Society.

From the *Proceedings* of the Devon and Exeter Architectural Society we notice that the President, Mr. James Jerman, in the course of his address, said:—

From the widely-spread area of our Society's district it is difficult to bring together, except on very special occasions, a large body of members; much, therefore, must be left to the work of the elected Council. It may, however, be possible in time, and in conjunction with the other allied societies, to issue to every member a journal or report of our proceedings, say quarterly, in order that even the most distantly placed member of the Society may be kept in touch with matters affecting the profession. Probably the Royal Institute may see its way to consider the desirability of promoting the issue of such a publication for circulation between the allied societies on some general basis, and adapted to each locality. It may be said that the Royal Institute of British Architects' *Transactions*, issued fortnightly during the Sessions, include all matters of professional interest. This, however, cannot, and does not, provide a sufficient vehicle of inter-communication to enable the now numerous allied societies to fully publish their doings and set forth their aspirations.

ARCHÆOLOGICAL SOCIETIES.

Royal Archæological Institute.

The summer meeting of the Royal Archæological Institute of Great Britain and Ireland will be held at Northampton from July 23 to 31. On the first date, after a reception by the Mayor and Corporation of Northampton, the Society will visit the churches of St. Sepulchre, St. Peter, St. Giles, and Eleanor Cross at Hardingstone. On the following days visits will be made to Montague's Hospital, Weekley; Broughton House, Jesus Hospital, Lyde House, Rockingham Castle, Kirby Hall, Lamport, Ashby, and various churches in the County. The headquarters of the Institute will be at the Grand Hotel, Northampton.

The British Archæological Association.

The Council of the British Archæological Association has decided to hold the annual Congress in Gloucester from June 24 to 29. On the first afternoon a visit will be paid to Gloucester Cathedral, where an address will be delivered by the Dean, and in the evening there will be a reception by the Mayor of Gloucester at the Guildhall, and the delivery of the Presidential Address by Mr. Charles E. Keyser. The following days will be spent in the inspection of places of historic interest in Gloucester City and in visits to such places as Berkeley Church and Castle, the Saxon Church and the Chapel of Odda at Deerhurst, Thornbury Church and Castle, and Winchcombe Abbey.

ENGINEERING SOCIETIES.

The Society of Engineers (Incorporated).

The third annual dinner of the Society of Engineers (Incorporated) was held at the Criterion Restaurant on May 11, Mr. John Kennedy, the President, being in the chair. The company included Sir Maurice Fitzmaurice, K.C.M.G., Chief Engineer to the London County Council; Mr. Alexander Siemens, Past-President Inst.C.E.; Mr. H. P. Boulnois, Past-President Inst.C.E., Chairman of the Royal Sanitary Institute; Mr. William Clarke, M.Inst.C.E.; Mr. J. W. Wilson, M.Inst.C.E., M.I.Mech.E.; Mr. Arthur Valon, A.M.Inst.C.E., Vice-President; Mr. D. B. Butler, A.M.Inst.C.E., Hon. Secretary and Treasurer; Mr. A. S. E. Ackermann, B.Sc. (Engineering), A.C.G.I., A.M.Inst.C.E., Secretary. The loyal toasts, proposed by the President, having been honoured, Sir David Gill proposed "The Society," to which the Vice-President responded. The toast of "The Ladies" was proposed by Mr. J. W. Wilson, and acknowledged by Miss Siemens.

GENERAL NEWS.

The Royal Institute of British Architects.

The photographs and drawings brought over by Mr. R. A. Cram, the eminent American architect, to illustrate his paper on "Recent University Architecture in the United States," read before the Royal Institute of British Architects last Monday, will be on view in the Galleries of the Royal Institute, 9, Conduit-street, W., until Saturday, June 1. Admission on presentation of visiting-card.

Board of Architectural Studies, Cambridge University.

The general Board of Studies recommend the establishment in the University of a Board of Architectural Studies with the objects of organising the teaching of architectural subjects in the University, framing lecture lists for inclusion in the lists of lectures published by the General Board of Studies, and admitting students to courses of research in architecture. The new Board will include the Disney Professor of Archæology, the Slade Professor of Fine Art, the Professor of Mechanism and Applied Mechanics, the Reader in Classical Archæology, four members of the Senate, and two members nominated annually by the Board.

Royal Academy of Arts.

Mr. William Llewellyn, who has just been elected an Associate of the Royal Academy, was born in 1863, and has been a regular exhibitor in the Royal Academy rooms, mainly of portraits, during twenty-five years past. He entered the Kensington Training School in 1881, when Sir Edward Poynter, P.R.A., was Principal, and then studied at Paris, in the ateliers of Julien and Ferdinand Cormon. He is a member of the Society of Twenty-Five Painters and the Royal Society of Portrait Painters.

London Institution.

In furtherance of the scheme already adverted to in our columns the Board of Education have framed a Bill, to be introduced in the current session of Parliament, for vesting in H.M.'s Commissioners of Works the property and buildings of the London Institution, Finsbury-circus, E.C., as incorporated by Royal Charter of January 21, 1807, and for their use for purposes of the contemplated School of Oriental Languages. The Government will make compensation to the present proprietors, and will give a grant of from 20,000*l.* to 25,000*l.* for alterations of the premises and an annual subsidy of 4,000*l.* for maintenance.

"Shakespeare's England," Earl's Court.

For the exhibition that was opened last week at Earl's Court some models of old buildings have been made by Mr. E. Lutyens. Amongst the typical buildings represented are—in the Ducal Hall—Shakespeare's house; St. Mary's Church and Ford's Hospital, Coventry; the Windsor Cloisters; Ledbury Hall; and the old house, *temp.* the Commonwealth, of Dixter. There are also reproductions of the Fortune Theatre, London; Queens' College, Cambridge, and St. John's College, Oxford; Rushton and Compton Wynyates; Ockwells; Salisbury Cross; and some of the houses in Stamford. In the lake is a model of the *Revenge*, built under the superintendence of Mr. Seymour Lucas, R.A.

Spitalfields Market Improvements.

A Committee of the House of Lords, under the presidency of Lord Bristol, have found the preamble as proved and have ordered to be reported to the House for Third Reading the Bill promoted by the Stepney Borough Council in respect of the Spitalfields Market area. The Bill requires the Corporation of the City of London to carry out certain improvements in and about the market area whereof, in pursuance of an Act of 1902, the Corporation acquired the freehold; that Act also empowered the Corporation to acquire within ten years the leasehold interests in the market held by Mr. R. Horner. The Corporation had neither obtained possession nor proceeded with the improvements; the Borough Council contend that the obligation to make the improvements is distinct from the acquisition of the market for its transfer to the Borough Council.

The Wertheimer Art Sale.

The collections of the late Mr. Charles J. Wertheimer, of Norfolk-street, Park-lane, W., who died on April 25 last year, have just been dispersed at Messrs. Christie's rooms. The principal lots included several old French clocks, of which two—a Louis XIV. clock, 32 in. high, in a drum case of tortoiseshell, with bronze figures of Venus and Cupid, and a Louis XVI. clock, 22 in. high, in a case in the fashion of a celestial sphere, overlaid with lapis-lazuli plaques—were bought by Mr. Asher Wertheimer for 2,700 guineas and 2,500 guineas respectively. M. Jacques Seligmann, of Paris, purchased, for 13,000 guineas, the suite of gilt carved wood settee, bergère, and six fauteuils, having their seats, backs, and arms upholstered in old Beauvais tapestry with Boucher designs, and a Savonnerie carpet, 25½ ft. long by 16½ ft. wide, woven with a floral pattern in polychrome upon a black ground, was sold for 2,600 guineas (Lenygon). The two days' sale of 164 lots realised 92,463*l.*

Israels at the French Gallery.

Messrs. Wallis & Son, who, by the way, are plaintiffs against the United Service Club in an ancient lights action, have opened a Memorial Exhibition of the pictures of Joseph Israels, Hon. R.A., who died at The Hague last year. Some of the paintings are old favourites, such as the eloquent "Grace Before Meal" and the realistic "Scribe." One is struck by the likeness of such early works as "The Bather" and "Meditation" to the ideals of Etty, while the dignity and technique of "Après la Messe," a portrait of great intensity, reveals the origin of the designation of Israels as "the Jewish Rembrandt."

COMPETITION NEWS.

Hale Town-Planning Competition.

The Council of the Manchester Society of Architects have been informed that the District Council of Hale have reconsidered their decision, and have agreed to revise the conditions in respect to the points alluded to in our issue of May 3 (p. 513), namely, to issue a plan of the district for the competitors, with particulars up to date of houses, sewers, and main levels; to delete the clause in their conditions asking for the architect's inclusive fee for subsequent work; to appoint a competent advisor, to be approved by the Council of the Manchester Society of Architects, to assist the Committee; an extension of time for sending in plans will be given. The Council of the Manchester Society have intimated to their members that these conditions, as revised, are satisfactory. The restriction issued previously therefore has been withdrawn.

Model Colliery Village, Glamorgan.

The idea of promoting a competition for a model village in the Ely Valley, between Llantrisant and Tonyrefail, was excellent, but we fear the result will not fulfil the expectations of those concerned. This is a pity, for the competition, under good conditions, might have produced interesting suggestions for dealing with a topical problem. Briefly, the Welsh Navigation Steam Coal Company ask for a scheme for a model colliery town and offer a premium of 20*l.* But as the adjudicator (whose decision is final) is the Chairman of the company, unsupported, it seems, by any professional advice, and as "all the plans, estimates, etc., forwarded to the company will become its property," no architects of repute are likely to respond to the invitation to compete.

School at Greenock.

For the new school in the West-end of Greenock Mr. William R. Glen, of Glasgow, has been appointed architect. The design of Mr. Peter Caldwell, of Paisley, was placed second (40 guineas premium), and that by Mr. James Rome, of Kilmarnock, third (30 guineas premium).

Baptist Chapel, Bedford.

In a recent competition, for the Russel Park Baptist Chapel, Bedford, the designs submitted by Messrs. George Baines & Son, 5, Clement's-inn, Strand, W.C., were placed first, and the firm have been appointed architects for the scheme.

Church, Schools, etc., Mansfield.

The limited competition recently held for U.M. church, schools, institute, and caretaker's house, in Nottingham-road, Mansfield, has been settled in favour of Messrs. George Baines & Son, 5, Clement's-inn, Strand, W.C., and the first section of the scheme, estimated to cost about 4,700*l.*, is to be proceeded with at once.

Art Gallery and Museum, Belfast.

The Belfast Corporation have decided to erect an Art Gallery and Museum on a site in the Botanic Gardens Park, which is a public park situated in the southern district of the city, and adjoins the grounds of the Queen's University. The Local Government Board have made an order authorising the appropriation of the portion of the park for the purpose indicated. The Corporation have acquired an additional 6 acres of ground adjoining for park extension purposes. The site for the proposed Art Gallery and Museum is 1 acre and 14 perches in extent. It has a frontage of 170 ft. to the Stranmillis-road, which bounds the park on the eastern side. The matter is in the hands of the Library and Technical Instruction Committee, who purpose inviting competitive designs, but their arrangements are not yet sufficiently advanced to be made public.

BOOKS.

Columns and Struts: Theory and Practical Design. By WILLIAM ALEXANDER, M.Inst.C.E. 101 illustrations. (London: E. & F. N. Spon, Ltd. 1912. Pp. 267. 10s. 6d. net.)

THIS treatise deserves more than ordinary attention because it is written by an engineer of considerable practical experience in the design of large struts, and who is consequently able to deal with various practical matters which cannot be discussed with like authority by a purely theoretical writer.

For columns, struts, or stanchions of small dimensions employed in building construction refinements in theoretical calculations are unimportant, as members of the kind usually consist of rolled sections, the safe loads for which have been ascertained by actual tests.

In built-up columns, however, the theoretical section can be more closely attained by the selection and combination of different bars. The larger the member the more closely can theoretical requirements be approached and the more necessary it is to inquire into the reliability of theories or formulæ.

Chapter II. is an analysis of various existing formulæ and is welcome as an additional reminder of the limitations attaching to the many empirical or semi-empirical formulæ that have been put forward for the design of columns and struts.

In succeeding chapters the author investigates the mechanics of column and strut phenomena on lines somewhat different from those usually followed. The true relations between load and deflection are demonstrated and the resulting equations are based upon the permissible amount of deflection, which in turn is determined from the permissible fibre stress intensity.

Comformably with this treatment the character of the web stresses is shown, and their values are determined directly from the equations to the curves of deflection, instead of being computed from an imaginary transverse load, in accordance with customary practice.

The author deals later with the influence exercised by the form of the cross-section of a strut on its strength, and discusses in detail the efficiency of various familiar sections from the same standpoint. The practical equations derived from this investigation make due allowance for sectional form in a manner that obviates the need for the usual empirical constants.

Chapter XI. includes the discussion of columns, the section of which is not uniform from end to end, but tapered continuously or reduced in steps. The general effect of tapering is indicated, and a number of practical matters are discussed.

Chapter XII. is devoted to a detailed consideration of the struts which were the first to fail in the Quebec Bridge, a part of the book that will thoroughly repay perusal.

In the final chapter we have a summary of the equations required for practical design and a number of problems worked out so as to illustrate the correct application of the formulæ.

As may be judged from what we have said, this work is by no means a primer for the student, but rather a treatise for the practical structural engineer, who will find it a serviceable addition to previous writings on the same important subject.

Engineering Work in Public Buildings. By R. OWEN ALLSOP, architect. Seventy-five illustrations. (London: E. & F. N. Spon, Ltd. 1912. Pp. 158. 12s. 6d. net.)

THIS book deals with power, lighting, heating, ventilation, and water supply installations in public institutions and other large buildings, and should be appreciated by architects who may have occasion to deal with such matters. It would be impossible to discuss these subjects in a manner satisfactory from the engineer's standpoint within the limits of the present volume, but Mr. Allsop, as an architect himself, has shown just appreciation of the kind of information required by members of his profession. The volume is written on broad lines, is well illustrated by line drawings, and has a useful index.

The Theory and Practice of Heating and Ventilation. By A. H. BARKER, B.Sc., B.A. (Lond.). (London: The Caxton Press. 1912. Pp., text, 740; appendix, lxxvi.)

SINCE the historic treatise of Hood was gradually rendered obsolete by modern developments in the practice of heating and ventilation, there has existed in the United Kingdom much need for a really comprehensive work on that branch of engineering.

We gladly welcome the enclopædic volume written and compiled by Mr. Barker, who possesses the special qualifications given by practical experience as a heating and ventilating engineer, in addition to those afforded by scientific training.

The object of the work is to give a detailed explanation of the application of scientific principles to the problems with which the heating and ventilating engineer is confronted, and to point out the limits within which these principles can be practically applied.

Apparent discrepancies between theory and practice are more noticeable and more difficult to account for in heating and ventilating than in most other branches of engineering. For this reason a full recognition of the limitations affecting the application of theory is almost as necessary to thorough understanding of the subject as knowledge of the principles involved.

Instead of blindly accepting the conclusions drawn from experimental and theoretical investigation as directly applicable to the solution of problems, the author has critically examined the applicability of scientific principles in the light of practical experience.

Those who have had experience are fully aware that the problems arising in heating and ventilation practice are as elusive and difficult of accurate solution as any with which an engineer may be confronted. It is scarcely possible to explain intelligibly and correctly the application of fundamental principles to the solution of such problems except in a manner which assumes that the reader possesses a certain amount of scientific knowledge.

Therefore, in the earlier part of this book, Mr. Barker gives a *résumé* of the principles with which the reader is supposed to be familiar, and this serves the part of an introduction to the chapters devoted to applications of the principles. It may be remarked here that the author has not attempted to describe practical details of construction or the mechanical work involved in the installation of apparatus.

To convey in a few words the scope of the treatise, we give the following brief survey of its contents.

In Chapters I. to IV. are discussed the properties of matter, motion, energy, heat, air, water, and steam. Then, after a chapter on the flow of liquids and gases, come six chapters on ventilation, the first of the series dealing with hygienic considerations and the others with the movement of air and the calculation of quantities in ventilation. Next we have six other chapters, constituting a group devoted to heat transmission, methods of supplying and distributing heat, the emission of heat from radiating surfaces, and the temperature maintained in a building. After these chapters the subjects taken up include boilers and chimneys, methods of heating and humidifying air, the design of pipe installations, various systems of heating buildings, and the testing of heating and ventilating plant.

At the end of the volume is an appendix containing a large collection of useful tables and memoranda.

The general conception of this work and the manner in which the idea has been realised leave nothing to be desired. It fills a long-felt gap in technical literature, and will undoubtedly be accepted with gratitude by the professional and commercial classes who are directly interested in the theory and practice of heating and ventilation. The labour involved in the preparation of the text and the numerous tables and diagrams by which this is accompanied has obviously been very great, and we cannot help wondering that a man full of professional and commercial business should have been able to spare the time for undertaking so heavy a task, upon the completion of which the author is to be congratulated most heartily.

CORRESPONDENCE.

Exhibition of Port of London Competition Designs.

SIR,—With reference to Mr. Quennell's letter, published in your issue of April 19, we notice that no further remarks have been called forth from other competitors. We now beg to suggest that, in face of the difficulty of getting together the majority of the designs submitted, owing to the extensive area from which the designs have been sent, at any rate an exhibition might be organised to show those designs sent in by London and district competitors.

Of course, your correspondents do not suggest that such an exhibition should be held until after the final decision of the assessor.

Premises for the accommodation of such an exhibition could, we feel sure, be secured with comparative facility—possibly the galleries of the Royal Institute of British Architects or those of the Architectural Association, or, if neither are obtainable, there is a chance that the lately re-erected Crosby Hall (Chelsea) might be available for this purpose.

We believe that the governing bodies of either of these institutions and building would be likely to give their aid to encourage a movement the sole aim of which would be to benefit the profession in general.

ARTHUR E. MAXWELL.
C. ORLANDO LAW (Lic.).

The R.I.B.A. Elections.

SIR,—Regularly with the advent of the Royal Institute of British Architects' Council and Committees' election each year there appear in the columns of the professional Press pathetic letters from gentlemen asking for instruction and help in filling up their papers. Such a one has appeared within the last fortnight, reiterating the same old complaint in the following terms:—

"The time will soon arrive again when the members of the Institute will have to elect their representatives on the Council and various Committees for the coming year, and, bearing in mind the difficulty the average member has in deciding for whom to vote, I venture to inquire if something cannot be done to assist him in his selection.

I think I am safe in saying that to most members many of the candidates—particularly new ones—are comparatively, if not quite, unknown, or, if known, their ability, experience and work are not. It must be remembered that the architect gains his knowledge of his professional fellows chiefly by means of the building journals and the various particulars of buildings they publish; now there are many men of large practice whose names never seem to get into print, and whose drawings are never published; it follows, then, that these men are probably unknown to their brother architects, and when, as sometimes happens, they are listed among the candidates, they invariably fail to receive sufficient support for election, notwithstanding that their experience is far greater than many of those who do manage to gain a seat."

May I, Sir, offer the suggestion to distressed voters that the careful and regular perusal of the accounts of the business meetings published in the Royal Institute of British Architects' *Journal* would prove a much greater help in selecting candidates than the mere haphazard

voting for a member because he happens to have a penchant for seeing his work continuously illustrated in the professional journals?

I think that many, both on the Council and off, must agree with the entire truthfulness of the statement above quoted, and I am convinced it is a matter which should be inquired into with a view to adopting some procedure more satisfactorily to meet the needs of these progressive days. I believe there exists an almost unanimous feeling against individual canvassing in a body such as ours, but this does not prove the case pro or contra. In the case of Parliamentary candidates (I think I am right in saying in other of the professions, closed and otherwise) canvassing is adopted as a matter of course, without—where everyone is on the same footing—any great harm ensuing.

The writer of this letter is also a candidate, but in this case he desires carefully to retain his anonymity, and therefore signs himself

MEMBER, R.I.B.A.

"A Piccadilly Blunder."

SIR,—Under this heading in the leading article of the *Builder* of May 17 you publish a statement concerning the occupier of the corner premises, next to the Piccadilly Hotel, which tends to seriously aggravate the annoyance to which Messrs. Denman, the building owners, and myself, whilst acting for them, are subjected, by reason of the unavoidable necessity on their part of reinstating their premises, which you think right to describe as a hopeless blunder and an eyesore.

You state that you understand the decision to rebuild the old front has been arrived at owing to the fact that the occupier considers a repeat of the hotel gable would be quite unsuitable for the purposes of his business, and you further state that had the matter been rightly handled some arrangement could have been arrived at which would have given the occupier a reasonable elevation suitable to his purpose.

Messrs. Denman have not refused to repeat the hotel gable; on the contrary, they agreed to the completion of the hotel being carried out by the hotel company, and they permitted their own building to remain at a standstill in a half-demolished state for eleven months to enable arrangements between the Crown authorities and the hotel company to be completed. Such arrangements however failed.

Messrs. Denman then offered to erect a new building for themselves designed with a slight modification of the hotel architecture; this design was acceptable to the Crown authorities, but could not be carried into execution on account of certain concessions having been granted by the Crown to the hotel company, whereby the consent of that company became necessary, and which consent the Crown were not able to obtain.

These facts should show that Messrs. Denman have done all that they possibly could to avoid leaking up the continuity of the desired architectural treatment of this part of Piccadilly. Their efforts have resulted in nothing but delay with their own building, and heavy costs to themselves for useless negotiations which were beyond their power to conclude successfully.

As this matter has attracted so much public notice, particularly in the West-end of London, I think you will agree that you cannot do otherwise than publish this letter in fairness to my clients and to myself.

WILLIAM A. HASKINS.

Lighting by Air-Gas.

SIR,—I had my attention drawn to your article on the above subject in your issue of April 26, and I should have written at once to protest against some of the statements made in that article, particularly to the table of comparative costs, wherein acetylene is put down at 1s. 3d. and air-gas at 1½d. I was, however, informed that others were writing to, and so I waited to see what might be said by others.

In your issue of May 10 you have published an extremely moderate letter from the Acetylene Publicity, Ltd., who have, in my opinion, underrated the case for acetylene.

You state in your original article was supplied by a named firm, and you practically suggest that in such cases tables of costs must be taken with a grain of salt. That is what we have always done and what we have believed the public have done with regard to the wild statements which have recently been made as to the cost of air-gas. You, however, in your footnote contradict the statement made by the Publicity Company as to the price of carbide. The Publicity Company tell you in their letter that carbide costs 1½d. a pound, and you for some reason say that it costs double that sum.

Now, Sir, this Corporation imports and sells between 4,000 and 5,000 tons of carbide per annum, and I have to inform you that carbide at the present moment is at a higher price than it has been for several years, and yet we sell in 1 cwt. lots at 14s. per hundredweight, and when purchased in 4 cwt. lots and upwards—as is always the case where a house of even twenty lights has to be lit—the price is 13s. 6d. per hundredweight. This price, you can readily see for yourself, works out at less than 1¼d. per pound. Further, the carbide is sold to the small trader at a price which enables him also to supply his local customer at the prices I have named.

Therefore, in obtaining the data upon which you base your statement that carbide is 3d. per pound, I can only assume that you must have bought a pound tin of some specially doctored carbide used for some patent cycle lamp, which, of course, is not the carbide which is used for serious lighting schemes.

The figure, therefore, at which acetylene must be taken is 6d. and not 1s. 3d., and this 6d. represents acetylene burnt in a flat flame. Now, Sir, in your table of costs, coal-gas burnt as a flat flame is put down at 1s.; coal-gas burnt in an incandescent mantle is put down at 2½d. If the figure were 3d., we could say your article shows that the cost of using coal-gas with a mantle is one-quarter the cost of using coal-gas in a flat flame, and, Sir, the proportion of cost between using acetylene as a flat flame and using acetylene with a mantle is the same as for coal-gas. Therefore, if we use a mantle with acetylene, the 6d. is turned into 1½d., which is exactly the same as the figure given by the particular firm in your article for their own light, which figure, as you will readily admit, has to be taken with a grain of salt. In fact, your table of figures should be as follows:—

	s.	d.
Acetylene, flat flame		6
Acetylene with a mantle		1½
Electric—incandescent	1	2
Flat flame coal-gas	1	"
Duplex oil lamp		7½
Incandescent coal-gas		2½
Air-gas		1½

I do not propose to criticise the air-gas 1½d., but I could prove beyond all question that it is at least 3d. However, all we have ever claimed is that acetylene is equal in price to air-gas—carbide as against petrol and mantles. Where an acetylene plant is installed no repairs or renewals are required for years. Where air-gas is installed the mantles have to be changed very frequently, and it is also necessary to contemplate a new hot-air engine occasionally, and in some makes we have known a hot-air engine to be worn out and require renewal inside the first twelve months. We do not very extensively use the mantle with acetylene for domestic purposes, because we find that a 100-candle-power light, such as the air-gas people give as the standard of comparison, is never required in domestic lighting, and herein lies one of the chief advantages of acetylene as against air-gas. The air-gas light is a fixed standard light, and, even if it is a small passage or a lavatory which is being lit, one of these powerful lights has to be employed, whereas with acetylene we have a range of burners from 3-candle-power upwards, each burning an exact proportion of gas to the candle-power given. Consequently we can make the definite statement that, apart from comparing high candle-powers, which is entirely misleading (but in which we do not, after all, show very badly), when house lighting is being considered, we can guarantee all comers, and we do guarantee all comers, that:—

1. Acetylene costs less to instal than air-gas.
2. Acetylene for lighting any given house properly costs no more than air-gas, and in many cases less.

If any of your readers are in doubt as to comparative costs, let them get an estimate from one of the firms who advertises that air-gas costs one-third the amount to instal which acetylene does, and we will undertake that we will supply a first-class acetylene installation at something less than the air-gas installation, and so prove that acetylene does not cost three times as much as air-gas to instal. The same firms will doubtless tell your readers that acetylene costs six times as much as air-gas to maintain. Therefore, with the estimate for the installation your readers should insist upon getting a price to maintain the lighting and the plant for one or more years. We will undertake to maintain the acetylene lighting at the same price, and thus prove that acetylene does not cost six times as much as air-gas. We have done this in many cases, and this, indeed, is the only method now left open to us to refute the extravagant statements which are being made by some of the air-gas companies.

Where an actual owner of an air-gas plant has given figures which would substantiate air-gas firms' claims that air-gas costs practically nothing to maintain, and we have had an opportunity of investigating the case, we have usually found that the petrol has been purchased and booked down to the motor-cars, nothing being charged against the air-gas plant, and where an owner of an acetylene installation has had any real grievance about cost it has usually turned out that the carbide, having naturally been bought for lighting the house, has been regarded as used entirely for that purpose, whereas it has been used by the chauffeur in motor car lamps and by the gardener for various purposes.

In conclusion, I venture to point out to you that I have been engaged in the acetylene lighting business for sixteen years and in the air-gas lighting business for seven years. Consequently I may, perhaps, be given credit for speaking fairly.

There is an enormous field for both acetylene and air-gas, and in a way they do not even compete with each other, their fields lying in different directions; but neither the one nor the other can expect any permanent success based on original misstatements in obtaining business.

H. E. BAKER, Managing Director of THE ACETYLENE CORPORATION OF GREAT BRITAIN, LTD.,

SIR,—In your issue of May 10 you very kindly published a letter from me drawing attention to inaccurate statements in your journal as to the relative cost of lighting by acetylene and petrol air-gas.

In a footnote to my letter you say:—"The discrepancy complained of seems to be based on the price quoted for carbide, which is given by our correspondent at half that at which it is offered to the ordinary purchaser." In reply to this assertion I can only repeat that the market price of carbide to the consumer is not 28s. per hundredweight, but 14s., and for quantities exceeding 4 cwt. the price is 13s. 6d. per hundredweight.

ACETYLENE PUBLICITY, LTD.
VICTOR D. DUVAL (Manager).

FIFTY YEARS AGO.

From the *Builder* of May 24, 1862.

The Monument of the Emperor Nicholas I., St. Petersburg.

THE question of right principles of design for memorials of individuals the most eminent the several questions rather of nature of the testimonial and realisation of the idea of the *monument*, and all those which relate to the art-treatment of "public statues"—must shortly claim elucidation at our hands, or a restatement of views that long since we put forth. Pending the interval of the accomplishment of our duty, progress in the division last referred to, of the subject, will be induced by the publication that we make this week, of one of the most recently-achieved examples of the form of memorial on the Continent, which is commonly, and with a sort of logic which is productive of bad result, with us called *statue*. Seldom, indeed, do we find the intention which is that expressed by the term *monument*, along with the perception of the principles of collective art, which we have claimed as common with perception of what is architecture, and as perhaps best to be acquired through medium of an architect's education properly conducted—pursued and made apparent with the success that characterises the work which is now, probably for the first time, brought to the notice of British artists. The monument is that at St. Petersburg, just completed, of the Emperor Nicholas, which is due, so far as the main design, to an architect, and as regards the general execution and details to sculptors, individuals of different professions nominally, but who appear in this instance to have co-operated to produce the work which might appear that of one artist—architect capable of moulding the figure and feeling that *sculpture* should be predominant in such a monument, and a representation of the deceased be the end and keynote, or sculptor practised in the details of architectural mouldings and ornaments, and conversant with the æsthetics of our art and the principles of grouping and composition.

EDITORIAL SUMMARY.

"A Message from America" is the title of the leading article, dealing with the lecture of Mr. R. A. Cram at the meeting of the Royal Institute of British Architects on Monday.

The second article deals with the paintings at the Royal Academy Exhibition (p. 594).

"Notes" (p. 594) comprise: "The Nationalisation of Railways"; "Tattershall Castle"; "Regent's Quadrant Competition"; "Competition Publicity"; "Assessing the Assessor."

A meeting of the Royal Institute of British Architects was held on Monday, when Mr. R. A. Cram delivered a lecture on "Recent University Architecture in the United States" (p. 595).

A short article on the old General Post Office will be found on p. 599.

For some Parliamentary questions on Architectural Assistants and the Office of Works see p. 600.

The first summer visit of the Architectural Association took place on May 18 to Woking (p. 600).

In Architectural Societies (p. 600) will be found short notices of: "Devon and Exeter Architectural Society"; "The Society of Architects."

Book notices (p. 602) include: "Columns and Struts"; "The Theory and Practice of Heating and Ventilation"; "Engineering Work in Public Buildings."

In Correspondence columns (p. 602) will be found letters on: "The R.I.B.A. Elections"; "Exhibition of Port of London Competition Designs"; "A Piccadilly Blunder"; "Lighting by Air-Gas."

The Monthly Illustrated Review of Engineering (p. 605) includes: "Lighting by Acetylene Gas"; "Reinforced Concrete in Great Britain," etc.

The Building Trade Section (p. 609) contains: "Trade Disputes and Building Contracts"; "The Trade Union Bill"; "Government Contracts"; "Projected New Buildings in the Provinces," etc.

The annual dinner of the Quantity Surveyors' Association took place on Monday, see p. 612.

Legal Column (p. 613) includes notes on "London Building Act"; "The Right to Light."

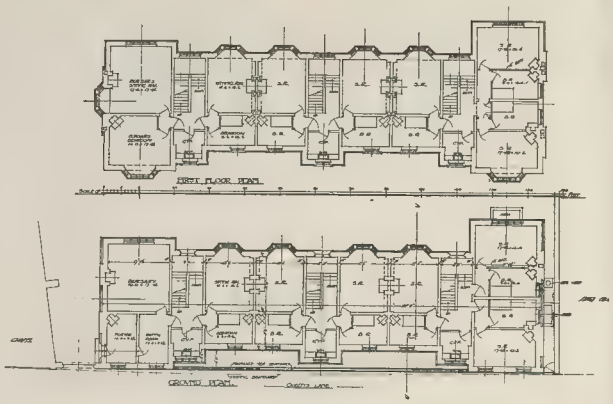
In Law Reports (p. 614) are short reports of the following cases: "Minturn *v.* Barry" case under the London Building Act; "Greig *v.* Robertson"—case under the London Building Act.

MEETINGS.

FRIDAY, MAY 24.

The Royal Sanitary Institute.—Provincial sessional meeting, Blackpool, in the Council Chamber, Town Hall, when discussions will take place on (1) "The Card Index System as Applied to Public Health Work," to be opened by Mr. E. W. Rees-Jones, M.D., D.P.H. (Medical Officer of Health, Blackpool), and "A Description of the Joint Scheme of Sewerage for Thornton-le-Fylde, Bispham-with-Norbreck and Carleton," to be opened by Mr. Arthur Hindle, M.Inst.C.E. The chair will be taken at 7.30 p.m. by Colonel J. Lane Notter, R.A.M.C., M.A., M.D.

Junior Institution of Engineers (at the rooms of the Institution, 39, Victoria-street, S.W.).—Mr. S. H. Hole on "Brewery Plant."



FRIDAY, MAY 31.

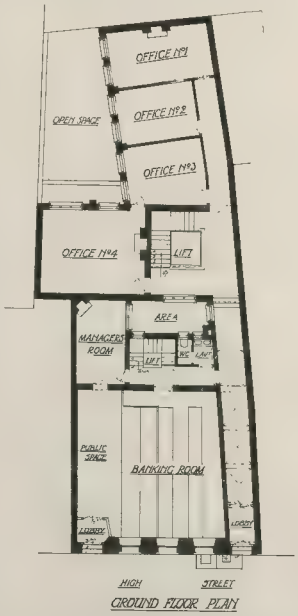
Junior Institution of Engineers.—Mr. Arthur Bourne on "Standardisation of Engineering Catalogues."

ILLUSTRATIONS.

Worksop College Chapel.

THIS College of St. Cuthbert's, Worksop, is one of the group of Woodard Schools scattered over the country and founded by Canon Woodard, the chapel forming the principal feature in each block of schools, that of Lancing being the best known. Messrs. Carpenter & Ingelow were the architects employed for the foundation of the schools

New Buildings, Queens' College, Cambridge.
Mr. Cecil G. Hare, Architect.



The Worksop School has for long used a temporary chapel until Lord Mountgarret came forward and offered to erect a permanent chapel at his own cost. This has now been done, and the chapel, an interior view of which we publish to-day, was opened on October 31 last.

The chapel is connected to the school buildings by an ante-chapel, and is 120 ft. long, 36 ft. wide, and 56 ft. to the centre of the ceiling, and seats 450 persons.

The builders were Messrs. Lowe & Sons, of Burton-on-Trent; the decoration of the ceiling was executed by Mr. F. A. Jackson; the sculpture and carving was executed by Mr. Paul Montford, R.B.A.; the clerk of works was Mr. F. Walker; and, since the retirement of Mr. Ingelow, the architect to the School has been Sir Aston Webb, R.A.

North-Western Polytechnic.

A LIMITED competition was held early in the present year for the North-Western Polytechnic, and the assessor, Mr. W. Flockhart, F.R.I.B.A., awarded the first place to Mr. Arnold Mitchell, F.R.I.B.A. The drawing now reproduced is exhibited at the Royal Academy.

GROUND FLOOR PLAN

Business Premises, Doncaster.
Mr. Sydney D. Kitson, F.R.I.B.A., Architect.

The site of the building is at the corner of Prince of Wales-road and Kentish Town-road, N.W. The main entrance is from Prince of Wales-road, and leads directly to the entrance hall, with main staircase opposite. The rooms are conveniently arranged as classrooms, laboratories, and workshops, and are designed for instruction of a nature to meet the growing requirements of the district. The exterior is of brick and stone, simple in treatment, consistent with a rigid limit of cost.

Business Premises, Doncaster.

THIS building, situated in the centre of Doncaster, is now in course of erection for Colonel Somerville, to take the place of an old house and garden.

The front of the ground floor will be occupied by a bank, while the rear portion of the ground floor and the whole of the upper stories are intended for offices.

The front is being built of Portland stone with steel window frames. The whole of the floors are of concrete construction reinforced with steel joists and expanded metal.

Mr. Sydney D. Kitson, F.R.I.B.A., is the architect, and Messrs. Harold Arnold & Sons, of Doncaster, are the contractors.

Queens' College, Cambridge.

THESE new buildings are to be erected on the site of some old almshouses, and will form the third side of an incomplete quadrangle. The chapel is to the north and Fawcett's Buildings to the south.

The east side of the new block abuts directly on to Queens'-lane, and this elevation forms the subject of the illustration, the original of which was shown in the Royal Academy Exhibition last year.

The buildings provide accommodation for twenty-six undergraduates, with rooms also for the bursar and occasional guests, and have been planned in the traditional manner.

The materials proposed are small red brick with Clipsham stone dressings and red-tiled roof, in harmony with existing buildings, and the buildings are arranged with fireproof floors and staircases throughout. Bathrooms and lavatories have been arranged in the basement.

The late Mr. G. F. Bodley was responsible for the chapel, while the new buildings which adjoin it have been designed by Mr. Cecil G. Hare.

INTERNATIONAL FIRE SERVICE COUNCIL.

This year's general meeting of the International Fire Service Council has been postponed to Wednesday, June 5, which is the last day of the International Conference on Fire Prevention. Fire Service, and Fire Insurance Questions, to be held under the auspices of the Council on June 2 and subsequent days, instead of the previously announced May 25. The Council's temporary headquarters are at the Hôtel de l'Europe, St. Petersburg.

MONTHLY REVIEW · *of* · ENGINEERING.

LIGHTING BY ACETYLENE GAS.

LAST century might be said to have commenced a new era so far as lighting is concerned. In 1836 the great chemist Davy found that the residue obtained the extraction of potassium evolved an l-smelling combustible gas when brought o contact with water, and in 1862 Wöhler ually produced calcium carbide and from acetylene, which compound (calcium carbide) s decomposed by water and formed lime, ing off at the same time acetylene. Thus first steps were taken which of late years ve led to the useful manufacture of a duct and gas which have become of great to the public in general. Other gases were sely investigated, with the result that we v have a choice of several effective means lighting for various purposes.

The material from which the gas is primarily de must be one that can be readily obtained mmercially at a low rate. Calcium carbide, m which acetylene gas is produced, is now ell-known commodity, and its adaptability been effectively demonstrated by cyclists motorists.

The manufacture of the gas must be done in imple a way as possible; the plant must not complicated, but should be of such simple gn that a stable-boy can attend to it. tylene is made in the plant by bringing er and calcium carbide into contact, their mical combination producing the gas. chemical action is shown by the following ation, $CaC_2 + H_2O = C_2H_2 + CaO$. That say, the carbon of the calcium carbide and hydrogen of the water unite, forming ylene (C_2H_2) and lime.

alcium carbide is a hard greyish crystalline d, staple in dry air, but decomposed by the llest quantity of water. It must therefore tored in air-tight bins. It is manufactured fusing a pure form of coke or powdered lon and well-burnt lime in an electric ace. Thus can be briefly described the ufacture of acetylene gas. Regarding its perties, acetylene is a colourless gas with a penetrating smell—by which means a age is readily detected—but giving no smell ng combustion, and taking but little oxygen the air in this process. It has poisonous perties, as also have other gases which times occur in it, but these are removed in various gas plants by washing the gas making it pass through a purifier containing emical substance. The light is a pure e light, a very near approach to sunlight.

ne following particulars are taken from pp's "Year-Book," and show the various perties of acetylene or C_2H_2.

Generating Plants.

The plants employed may be classed generally under two heads, viz., water to carbide or water-fed and (2) carbide to water or carbide-fed.

In the first the water is added generally in small quantities to the carbide, which is placed in suitable trays, etc., whilst in the second the carbide is placed directly into a receptacle containing water. Two general types of both these classes are employed, viz., the automatic and non-automatic plants. The automatic plant is one in which the acetylene is produced as required, the machine working according to the demand; the non-automatic is one in which the supply is stored in a gas-holder and generally made some time before it is actually required. It must be clearly understood that these notes but briefly describe various makes of machines, and are simply to illustrate some of the types. As improvements are from time to time being made by each manufacturer in the matter of detail as a result of experiment and experience, the construction and arrangements vary accordingly.

As examples of the water-fed automatic plant and the carbide-fed non-automatic plant, the machines manufactured by the Imperial Light, Ltd., may be described.

In the water-fed machine the trays in the generators (there may be two or more generators) are filled with carbide. The washer, the holder, and the water-tank are filled with water to a certain level and the purifier is charged with purifying material. To make acetylene, turn on one of the taps, and water will flow from the tank into the generator. Acetylene will then be given off by the carbide and, passing through the holder, will cause the bell to rise until the water control tap is automatically shut off. No more acetylene will be made until the gas in the bell is drawn off through the purifier, when on the fall of the bell more water is admitted. This automatic action continues until the first generator is exhausted, upon which the water automatically flows to the second generator. This continues until all the generators have become exhausted. The generators which have become exhausted can be recharged whilst the plant is working.

Plant by the Acetylene Corporation, Ltd.

The carbide-fed non-automatic plant works as follows:—Water is admitted to the generator, washer, and holder, and the purifier is charged with purifying material. Lumps of carbide are thrown into the generator through the valve, which, on coming into contact with the water, immediately begin to give off acetylene gas. The gas passes down through the washer, into the holder, where it is stored until required. The lime sludge which is formed in the generator is emptied by opening the sludge tap, and can be used for the garden, etc. Such is the general line upon which these plants work, but, of course, each make has slight differences of detail.

In the "Luby" Improved Generator, five to 1,000 lights, manufactured by Messrs. George Adlam & Sons, Ltd., the carbide to water principle is employed. The carbide is placed in a series of buckets, each holding about 1 lb. of carbide, and each bucket automatically discharges in turn into the shute communicating with the water in the bottom of the generator. The generation of gas causes the gasometer to rise, and as gas is taken from the gasometer for lighting this vessel falls and another bucketful of carbide is discharged into the shute. When the lights are not in use the "Automatic Generator" (another machine made by the same firm) which works on the water to carbide principle, ceases operation. This machine is suitable for small installations of five to twenty lights.

The A1 plant of the Acetylene Corporation, Ltd., is illustrated herewith. It consists of one or more generators, gas-holder, water-supply tank, washer, purifier, and water-trough. In the rectangular generators circular pans containing carbide are placed. In this plant the washer is a warm washer. A separate water-tank supplies the water for generation, just sufficient water for one charge being supplied at one time. The gas, having been washed in the warm washer, and dust and ammonia removed, it is conveyed through a cold-water jacketed pipe into the gas-holder, any condensation falling back into the washer. On leaving the gas-holder and before entering the service pipe, the gas is passed through the purifier, where any traces of phosphorus and sulphur remaining in the gas are removed.

The Dargue patent generator, manufactured by the Dargue Acetylene Gas Company, Ltd., may be described briefly as follows:—There is a water-tank and a gas-holder, while two cylinders pass through the water-tank and contain the carbide, etc. The water supply to the carbide is obtained from the water-tank and the quantity regulated by means of automatic valves operated by the rising and falling of the gas-holder. The continuity of the gas supply is maintained by having two or more carbide containers, which, coming automatically in action in turn, accomplish this. The carbide containers are surrounded by water to ensure a low temperature of generation. Before the gas flows into the gas-holder it is passed in a fine spray through part of the water in the gas-holder tank. A chemical purifier is made to suit the various sizes of the machines for the final cleansing of the gas.

Messrs. F. Braby & Co., Ltd., also manufacture various types of machine the working of which can be gathered by the remarks relating to other machines.

In the machine made by the Thorn & Hoddle Acetylene Company, Ltd., instead of the water falling in drops on to the carbide, the mechanical arrangements are such that the water gradually rises to surround the carbide. The gas after passing into the bell flows through the chemical purifier before it reaches the gas main, the whole contrivance being so arranged that the gas finally issues at the gas jets free from all impurities and in a cool, dry state.

The price of the chemical "curaze," sold by them for use in the purifier, is 6d. per pound, and chemically pure cotton wool is also supplied at 2s. a pound. The amount of chemical required varies with the number of lights. For four 20-candle-power lights 1½ lb. are required, whilst for 200 lights 30 lb. are necessary. One charge of chemical purifier lasts

from two to four months according to season. Suitable dimensions of the gas-house are given as 5 ft. × 6 ft. × 7 ft. 6 in. high for a small machine, and 7 ft. 6 in. × 9 ft. × 11 ft. high for a large plant.

Professor Vivian B. Lewis tested one of the machines mentioned, and found that the yield of gas was from 95 to 99 per cent. of that possible to be obtained from the carbide tested. There was a constant 3-in. pressure of gas at the burners, whilst in the generator the pressure did not exceed 11 in.

The general desirable points to be gained in gas production and supply might be tabulated as follows:—(1) A pure gas; (2) regular pressure at the burners; (3) no waste of carbide; (4) ample supply to suit the demand; (5) re-charging of plant without disturbance of lights; (6) gas-holder large enough to take any after-math of acetylene; (7) machine to be strong, of material unaffected by the gas, well constructed to prevent leakage, and as little complicated as possible; (8) small cost of up-keep.

There are other points, but perhaps these may be considered the most important. For instance, local considerations might limit the type of machine, such as scarcity of water.

Cost of Gas.

The cost of gas depends upon the market price of calcium carbide and upon the quantity purchased at one time. Assuming, for the sake of calculation, the price of 1½d. per pound, the next factor is the amount of gas that 1 lb. will produce. Professor Gatehouse tested one brand last year and found it capable of giving 5·38 cubic ft. of gas per pound. Of course, this amount depends upon the quality, and in any machine the thoroughness of the chemical action. Taking 5 cubic ft. as round figures, the next point is the consumption per burner and its candle-power. If a 25-candle-power burner consumes ½ cubic ft. of gas per hour, in ten hours 5 cubic ft. would be burnt. A 100-candle-power burner would consume four times this amount, or 4 lb. of carbide would be used. These assumptions, of course, must be altered to suit any particular case. Taking the cost of carbide at 1½d. per pound then, as 5 cubic ft. are produced from this and 20 cubic ft. are required for 100-candle-power light burning ten hours (at ½ cubic ft. of gas per hour for a 25-candle-power light), the total amount of carbide used is 4 lb. The cost of the above on this basis is therefore 4 lb. × 1½d. = 6d.

There is also the question of the renewal of the chemical purifier, cost of water, any repairs and attention necessary, etc., the last of which are very little. The expense of running a 250-light machine has in one case averaged about 2*l.* a year, excluding carbide.

With regard to the pipes and fittings. Acetylene has greater penetrative powers than gas, so special attention should be given to these. A much smaller bore pipe than is necessary for gas can be used, but it should be of the best material. The joints should be accurately fitting, necessitating a minimum amount of white-lead used. The fittings should also be of the best quality or else trouble is likely to ensue in leakages through cocks, etc.

Burners.

With regard to burners, Messrs. Bray's have patented several, of which some are on the union jet principle and some on the Bunsen principle. The holes for the delivery of the gas are very small, and arranged so that the gas jets impinge on one another and form a flat flame. The burners on the Bunsen principle can be turned down like ordinary gas jets without any fear of carbonisation, a risk always run by the other types. The burners on the Bunsen principle are the most expensive, some costing about 8s. 6d. a dozen. As the burners are made in various sizes, the following particulars, given by Professor Elsey Smith, might be useful:—Burners consuming ⅓ cubic ft. per hour give a light of 6·2 candles; burners consuming ½ cubic ft. per hour, 17·5 candles; burners consuming ⅝ cubic ft. per hour, 35 candles.

As with plant so with burners; therefore these figures are given simply as a means of illustration, for it must be remembered that engineering moves rapidly to-day, and what was considered good practice a few years ago has now become out of date.

For example, Messrs. Thorn & Hoddle, Ltd., give the consumption of the "Incanto" burners and corresponding candle-power as follows:—

⅛	ft. per	hour,	approximate	candle-power	20
¼	,,	,,	,,	,,	30
⅜	,,	,,	,,	,,	40
½	,,	,,	,,	,,	50
1	,,	,,	,,	,,	60

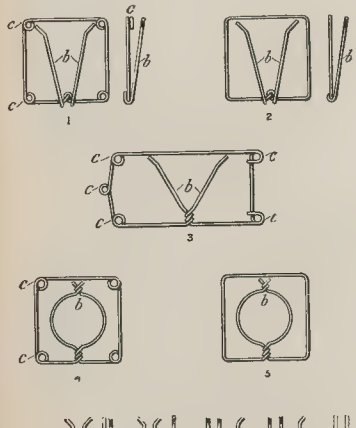
These are on the Bunsen principle and will not carbonise when the burners are turned low.

Speaking generally, the common coal-gas burners are the simplest in construction and action, although they are not economical now that incandescent mantles have been introduced. The fact is, however, that incandescent mantles do not remain clean and give their full lighting value, but soon begin to give a poorer light. Acetylene can be burnt either with the simple burners already mentioned or with the aid of incandescent mantles; with the latter a very great increase in brilliancy is obtained. As rapid developments are being made with incandescent mantles, and the fragile structure of those first introduced is being replaced by a less fragile material, there is every reason to suppose that the above objections will be greatly modified.

Bye-pass Switches.

To enable the light to be turned fully up when entering the room, bye-pass switches can be fixed at suitable positions near doors, etc. The pilot light, of course, must be first ignited, after which the switch can be used at any time.

Plant Buildings.



The plant should be placed in an external building, and smoking, etc., should be strictly forbidden in the room in which the plant is situated. To store calcium carbide it is necessary to obtain a licence from the local authority if the user desires to store any quantity of it. The insurance companies, however, make no extra charge for insurance.

As carbide, as has been previously stated, has a great affinity for water, for instance, in the form of moisture in the air, etc., it must be kept in an air-tight bin. These are specially made and are supplied by the various makers of acetylene plant.

Besides the general plant for the production of acetylene throughout the house, lamps of the "table-lamp" type can be had which employ acetylene. Similarly it has been applied to a variety of lamps, hand and otherwise, and is especially useful as a "flare lamp" for night work as commonly employed by contractors. Welding can be done by means of an oxy-acetylene flame as well as the cutting of metal, and in this way is of great use to structural engineers.

Extent of Adoption.

During the last decade the acetylene industry has developed considerably, and the illuminant has become well known and appreciated. Many thousands of plants of all capacities have been installed throughout the kingdom. It may be mentioned that, in order to reduce the cost of carriage of carbide, depôts for supplies have been established in London, Rochester, Ipswich, Hull, Newcastle-on-Tyne, Manchester, Cardiff, Glasgow, Aberdeen, Dublin, and elsewhere.

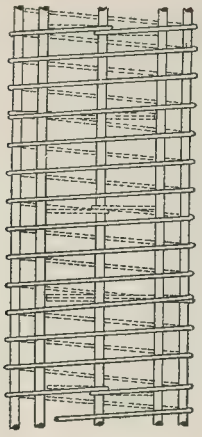
REINFORCED CONCRETE IN GREAT BRITAIN.—VI.



By W. NOBLE TWELVETREES.

(*Continued from page 429.*)

Paragon and Clinton Systems.—The special features of the Paragon system, worked by the British Reinforced Concrete Engineering Company, Ltd., of Westminster, are patented forms of transverse reinforcement for beams, floors, walls, and columns.

The patents are those of Mr. R. T. Surtees, granted in 1905, 1906, and 1907. The patent of 1905, amended in accordance with the decision of the Chief Examiner to the Patent Office in November, 1906, relates to bracings, hoops, or bonds for keeping the bars in reinforced concrete structures in position, for efficiently bracing the core of the structure, and for reinforcing the same core. The invention also provides for holding the bars in their correct relative positions during and after construction without the aid of struts.

Fig. 1 represents type of reinforcement as adapted for use in columns and beams. In it the bracing has a loop *c* at each corner to hold four bars in position, and arms *b* arranged for secure anchorage into the concrete core. Fig. 2 represents a bracing where the corner loops are omitted, this type being intended for use in conjunction with the type shown in Fig. 1.

g. 12. Spiral Reinforcement for Columns.

constructing a column about every fifth acing is similar to Fig. 1, and the intervening acings are similar to Fig. 2.

Fig. 3 illustrates a bracing for use in struc- res with a tongue on one side and a groove on other. It has five loops for holding in place reinforcing bars.

Figs. 4 and 5 are similar to Figs. 1 and 2, cept that the arms *b* are curved and their ds twisted to form a central ring to enable the acings to be used in the construction of umns or struts with a pipe or hollow around central axis.

Figs. 6 to 10 illustrate four varieties of the acings in the form of stirrups for beams, or slabs, and walls. In each case a loop *c* is med so as to grip the bars forming the gitudinal reinforcement, and the arms *b* may placed vertically or bent so as to lie at any ired angle.

Fig. 11 shows the application of the bracing l stirrups to beam and column construction.

The patent of 1906 relates to transverse nforcement for columns and similar members, l consisting of a length of spirally-wound tal with or without one or more loops in its gth, and its ends extending across the area losed by the wrapping. as illustrated in . 12. The spirals can have any required nber of turns in each section. It is claimed t this type of reinforcement possesses all advantages of spiral coils in continuous gths, with the additional advantages that the longitudinal bars are held in position, and that the concrete can be added in successive layers and well rammed instead of being poured in from the top of a closed mould.

When the column is complete the sections constitute one long helical wrapping from top to bottom. Helical coils of this description are suitable for columns of round, square, or polygonal cross section, and may be used in conjunction with "Paragon" hooping of the kind illustrated in Fig. 1, if desired.

The patent of 1907 relates to an improved stirrup for beams and similar members, the stirrup consisting of a rod or bar of metal of round, square, or other suitable cross-section, bent so as to form a loop suitable for threading on the main reinforcing bar, the projecting ends of the stirrups being long enough to extend into the opposite side of the beam, and arranged to lie at any required angle. The loop is made so as to grip the main bar with the object of preventing the stirrup from slipping. Fig. 13 represents the application of such stirrups to round and square bars.

For the reinforcement of concrete slabs, the British Reinforced Concrete Company employ a special type of wire mesh which has been largely adopted in the United States, where it is made by the Clinton Wire Cloth Company.

This fabric, which was introduced into Great Britain by the British Reinforced Concrete Company, consists of a wire mesh made up of a series of parallel longitudinal steel wires, spaced at certain distances apart, and held at intervals by means of transverse wires arranged at right angles to the longitudinal wires, being securely welded to them at the points of intersection by a patented electrical process. The appearance of the finished product is illustrated in Fig. 14, and the character of the weld between the longitudinal and transverse wires is shown by Fig. 15.

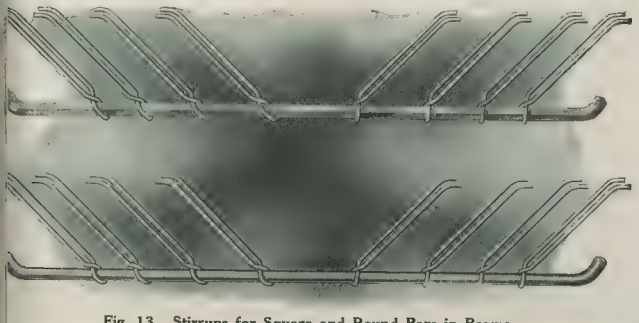


Fig. 13. Stirrups for Square and Round Bars in Beams.

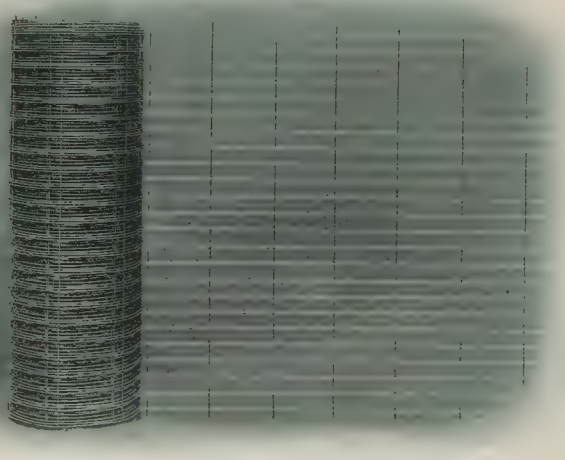

Fig. 14. Clinton Wire Fabric.

The Clinton fabric is suitable for the reinforcement of flat or curved concrete slabs in all kinds of reinforced concrete construction, as well as for the fire protection of steel work in conjunction with cement mortar or fire-resisting plaster.

The business methods of the British Reinforced Concrete Company may be thus briefly stated :—

In cases where they are asked to prepare designs on a professional basis payment is made at a percentage rate of the cost of the work, as in architectural practice.

In other cases the company prepare designs for clients, and obtain competitive estimates from building contractors who are competent to undertake reinforced concrete work. The successful contractor buys reinforcement from the company, whose profit on the sale covers the cost of designs, royalties, and the executive work in connexion with carrying out the contract.

In still other cases the company themselves quote for work, taking contracts direct, and making their own arrangements as regards sub-contracting.

All designs are in accordance with the rules and regulations recommended by the Royal Institute of British Architects Committee on Reinforced Concrete, and the company take full responsibility for reinforcement supplied if they have prepared the design for the work where such reinforcement is used, or if they have approved designs prepared by the architect or engineer responsible for the execution of the work.

Keedon System.—In our issue of November 3 last the essential features of this system, introduced by Messrs. Richard Johnson, Clapham, & Morris, Ltd., of Manchester, were described and illustrated.

Our readers are referred to the article in question for full details, but as a matter of convenience we may here state that the distinctive characteristic of the system is the employment of special web reinforcement in beams and special transverse reinforcement in columns, in conjunction with ordinary round steel bars.

The auxiliary reinforcement in each case is arranged so that it is securely keyed on to the main bars, with the object of preventing accidental displacement of the web or transverse members during the deposition and ramming of the concrete, and also for the purpose of providing an efficient mechanical bond between the concrete and the steel.

The "Keedon" reinforcement can be purchased at fixed charges by any one with or without the main bars. The firm give expert advice, designs, and tenders free of charge,

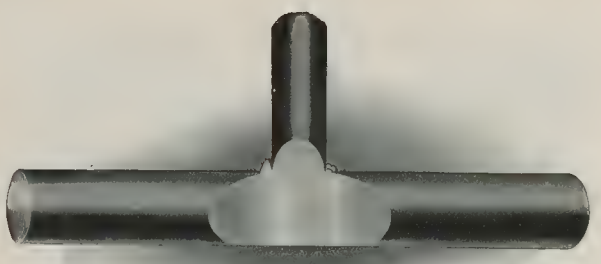

Fig. 15. Weld of Clinton Wire Fabric.

and accept full responsibility for any work designed by them.

As our readers are aware, Messrs. Richard Johnson, Clapham, & Morris have also made a speciality of reinforced brickwork, and are the proprietors of Johnson's Lattice system of reinforced concrete floors.

Expanded Metal.—A review of reinforced construction would obviously be incomplete without mention of the facilities placed at the disposal of architects and engineers by the Expanded Metal Company, Ltd., of York Mansions, Westminster, although the special types of reinforcement made by this firm are not recommended for application in connexion with any particular "system." On the contrary, they are available for general use in accordance with recognised principles of reinforced concrete design as well as for employment in structural and decorative details closely allied or incidental to reinforced concrete work.

Expanded metal sheets and expanded metal bars are supplied at fixed rates to all purchasers without restriction of any kind, and if desired by architects the company will undertake to furnish details showing the most suitable method of employing expanded metal alone or in conjunction with other forms of steel as reinforcement.

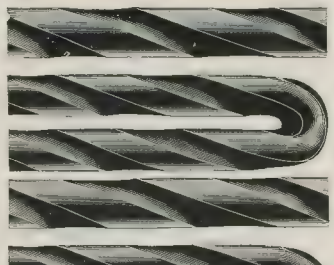
In our issues of December 10, 1910, and April 14, 1911, we devoted considerable attention to the uses of expanded metal in reinforced concrete and other types of construction. Nothing need be added at the present time to the particulars given in the above-mentioned numbers of the *Builder*, to which readers are referred for detailed information.

Spiral Bond Bars.—Although, like some other types of patented reinforcement, the bars recently introduced by the Spiral Bond Bar Company, Ltd., of Westminster, do not in themselves constitute a "system," they deserve mention in the present series of articles, being applicable to reinforced concrete construction of any kind designed in accordance with established principles.

These bars are rolled from mild steel of quality equal to that defined by the British Standard Specification for Structural Steel, but in consequence of the mechanical process to which the bars are subjected the elastic and ultimlimit ate strength of the metal are increased by more than 50 per cent. and 40 per cent. respectively, and the resistance to bending is increased by about 70 per cent.

As originally rolled, the bars are of hexagonal cross-section, and they are afterwards gently twisted until the surface presents the helically fluted appearance represented in Fig. 1.

Notwithstanding their high resistance, the bars are as ductile as ordinary mild steel bars, and can be bent cold, as shown in Fig. 2, without fracture.



The twisting is continued to a point which numerous trials and tests have proved to conduce to the most beneficial results, and it is interesting to note that it causes no change in the length of the bars, the fibres merely rotating about the centre of the bar.

The helical depressions are sufficient to ensure a good mechanical bond between the steel and the concrete, and thus obviate the need for bending the ends of the bars to J form, or of splitting and fish-tailing the bars in the usual manner.

These bars are at present produced in fifteen sizes, ranging from $\frac{5}{16}$ in. to $1\frac{1}{8}$ in. diameter, and are supplied by the company or their licensees without restrictions of any kind.

The advantages claimed for Spiral Bond bars are:—

(1) That, owing to the great strength and high elastic limit of the steel, 30 per cent.

Spiral Bond Bars.

less reinforcement is required than the amount necessary in the form of mild steel bars, and that a corresponding saving is effected in railway charges, cartage, and handling.

(2) That, owing to the high bending resistance of the steel, the bars are far less liable than ordinary to be bent in transit or after delivery.

(3) That the mechanical bond saves the cost of mechanical preparation such as fish-tailing and hooking, and furnishes additional security against any tendency of the steel to slip in the concrete.

(4) That every bar is self-tested by the mechanical process of twisting, all mill scale being at the same time removed.

OZONAIR SYSTEM OF AIR PURIFICATION.

MANY of our readers have doubtless appreciated the long-needed improvement recently effected in the Central London Railway tubes by the system of ventilation and air purification installed by Ozonair, Ltd., of Westminster.

The equipment consists of a separate and independent plant at each station with the exception of that at Shepherd's Bush, where the end of the tunnel communicates with open air.

Each plant includes an ozone generator, whence this active and allotropic form of oxygen is conveyed to the mixing chamber by a Sirocco pattern blowing fan, being there mixed with air drawn in through a cleansing screen.

From the outlet of the fan the ozonised air is blown down a main air trunk, discharging through outlets in the booking-hall and lavatories, and on the up and down platforms, the trunk terminating with outlets delivering into the tunnels.

The plants range in capacity from 5,500 to 18,000 cubic ft. per minute, and are capable of furnishing the total of more than 80 million cubic ft. of ozonised air every working day.

About one-third of the purified air is distributed along the platforms, and the remainder is delivered directly into the tunnels.

It is interesting to note that, according to the results ascertained by Mr. W. J. Dibdin, F.C.S., the air of the Central London Railway now contains considerably fewer organisms than the dust-laden air of the street, and that the air admitted by the Ozonair inlets is practically free from germs.

Our readers, who are more concerned with domestic than with railway ventilation, may be reminded that Ozonair apparatus is made in sizes suitable for employment in dwelling houses and buildings of every kind where pure air is a desideratum.

In most cases a regular supply of electric current is necessary for operating the apparatus, but small ozone generators are made which can be worked from batteries, and are therefore suitable for service in places where public supplies of electricity are not available.

ENGINEERING NOTES.

Port of Valparaiso.

IT is stated that Messrs. Pearson & Son have secured the contract, upon their tender of 2,600,000*l.*, for the construction of the new harbour at Valparaiso. The works, which will occupy seven years, comprise a breakwater 945 ft. in length, quay walls 2,066 ft., and 690 ft. long, a coal wharf 656 ft. by 100 ft., and a jetty 820 ft. by 328 ft. The harbour will be available for the berthing of the biggest modern vessels.

Reinforced Concrete: Piketty System.

WE have received from Messrs. Paul Piketty & Co., of Bloomsbury, a copy of their illustrated handbook, which, like the analogous publications of other specialist firms engaged in reinforced concrete work, is a technical prospectus rather than a catalogue.

In a recent issue of the *Builder* the essential features of the Piketty system were described and illustrated, and at the same time the commercial methods of the firm were briefly stated.

The present handbook goes into these matters more fully, and also sets forth the formulæ conceived by M. Piketty some twelve years ago, and published in the treatise by MM. Berger and Guillerme in the year 1902, these formulæ being essentially similar to those afterwards adopted by the Royal Institute of British Architects' Committee, the London County Council, and other authorities.

Although practically unknown in the United Kingdom, the Piketty system has been employed to a considerable extent on the Continent, and from figures given in the handbook it appears that works to the extent of more than half a million sterling have been executed in France on this system of reinforced concrete.

The book includes a good selection of photographic views representing typical architectural and engineering structures, and concludes with a reprint of the proposed regulations of the London County Council for reinforced concrete construction.

THE BUILDING TRADE.

TRADE DISPUTES AND BUILDING CONTRACTS.

IN a recent article we referred to the subject of "Builders and Strikes," and dealt with the law relating to strikes as hitherto laid down, but the modern development of trade disputes and the general strike, with the consequent dislocation of business and trade, have raised questions that may yet have to be decided in the Law Courts, and sending the decision of these points it behoves those engaged in trade to be especially careful in protecting themselves by contract.

Before dealing with what are known as strike clauses in contracts, a word or two may be said on the subject of the law and the development of the secondary and general strike. The law, as was stated in our article of May 10, where a man has contracted to perform certain work in a prescribed time, without qualification, holds him bound to perform his contract, and a strike has not afforded him any excuse for a breach of his unqualified undertaking. At the time when the decisions were delivered upon which this statement of the law is based strikes were generally the outcome of a dispute between an employer and his own workmen, and sect. 3 of the Conspiracy and Protection of Property Act was interpreted not to apply to civil actions at all—Quinn *v.* Leathem (1901). In the headnote to the decision of the House of Lords in this case, in the "Law Reports," it is stated that the words in the act section, "trade dispute between employers and workmen," "do not include a dispute on trade union matters between workmen who are members of a trade union and an employer or non-union men who refuses to employ union men. *Semble*, the words are restricted to disputes between an employer and his own workmen." If this accurately represents the effect of the judgments delivered in this case, which is one of considerable complication, it is apparent that not only did the Conspiracy Act afford no protection from civil actio is, but that also left the criminal law available where actions intervened to interfere between employer and employed to procure breaches of contract. The Royal Commission on Trade Disputes misinterpreted the Act, and also considered that it afforded no protection in the case of secondary strikes. However this may be, it is important to observe that the Trade Disputes Act has altered the law, enabling the trade unions to take part in trade disputes and depriving the public of their civil right of action where injury has been sustained which heretofore would have been actionable.

Strikes have therefore assumed different characteristics and proportions, and it yet remains to be seen whether the law as regards contracts will remain the same as it was when the reason of the law of conspiracy strikes were confined to disputes between an employer and his own workmen, and a right of action existed whereby an employer could protect his own interest. So long as strikes were so limited, it could well be argued that some means could be devised by the employer for carrying out his contract if he chose to settle the dispute so as to obtain labour or material from other places; but such a consideration can no longer apply in the case of labour disputes such as the coal strike or the railway strike, which paralyse trades wholly unconnected with the dispute, and it remains to be seen whether if will not be granted by the Courts to those who have been unable to carry out their contracts by reason of a total failure in the means of transport or of the means of production such as coal. Pending a decision of these knotty points, however, it is to the interest of builders and contractors to protect themselves and avoid litigation by the insertion of adequate strike clauses in their contracts, and the object we have in view in the present paper is to draw attention to the inadequacy of the clauses commonly inserted in building contracts to protect contractors from liability in the case of secondary or general strikes. In the Form of Agreement for Building Contracts issued by the Royal Institute of British Architects, Art. 25, which provides for extension of time, the words with reference to strikes are, "or by reason of any local combination of workmen or strikes or lock-out affecting any of the building trades."

This clause appears too narrow to meet the exigencies of the present time. The word "local" would seem undesirable, as it might be interpreted to govern the whole clause, and the expression, "affecting any of the building trades," appears capable of the construction that the strike or lock-out must affect the conditions of employment in the building trades. Neither the railway strike nor the coal strike fulfilled either of these conditions; the coal strike in particular could not be deemed in any sense "local" in certain localities, whilst, although both these strikes may have occasioned unavoidable delay in the execution of building and engineering contracts, neither of them affected the conditions of employment in the building trade.

Other forms of strike clauses found in text-books are equally inapplicable in many cases to modern strike developments. Thus "Provided always that in case the builder shall be prevented by any strike among his workmen" ("Emden on Building Contracts," p. 377), or "In case of any delay in the execution of the work caused by a general strike combination or lock-out of artificers or workmen employed in any of the building trades, or of workmen employed in the preparation or manufacture of materials intended for the work" (Emden, p. 396), are clauses which make no provision for dislocation of labour through a railway or coal strike, whilst even the clause set out in our recent article, "in case of combination of workmen or strikes or lock-outs affecting the building trades," is open to the second objection which we urged against the clause sanctioned by the Royal Institute.
